5926. 7½*d.* is about the price paid for the ordinary length of staple which you have mentioned?—Yes.

5927. But if you could produce parcels of cotton which would fetch 10*d.* to 1*s.* a lb. that, of course, would put you into a very different position?—Yes, I will show you the position in regard to that. We produced a crop of cotton down in the Transkei two years ago, and I believe that was sold for 10½*d.* That was the Sea Island variety, but Sea Island cotton in this country does not open out well, the boll only come about half open, and it takes a lot of trouble to get the cotton out, and the picking is very slow, and the natives do not take to it. It certainly brings a little better price, but the yield is not quite up to that of the American Upland varieties, and it is so much more trouble to gather that I doubt if it will pay better than the other variety.

5928. If Sea Island cotton can only be sold at the price you name then you are really up against the competition of a very much better Sea Island which damps you down?—Yes.

5929. But if you could produce cotton from American seed that would run out to 1½ inches in staple, or anyway from 1 7/16 to 1½ inches, I think there should be a very good scope for that, but now comes the question of the price at which you could produce. How are you off for labour?—We have any amount of labour, but it is not of much use. We find the natives take to it fairly well, but they are slow. Picking is the time when the farmers need more labour, and this part of the work the natives do not do very rapidly—about 50 or 60 lbs. of seed cotton per day, and that is not very much compared to the regular pick. The American average is, I believe, about 125 lbs.

5930. But for picking 60 lbs. of seed cotton, what would you have to pay your native labourer?—We usually pay about 1*s.*, so that would run out at something less than 2*s.* per 100 lbs.

5931. Well, of course, what you say would enable us to make a comparison between the cost of picking here and in America. Now, after the crop has been put in and the plants come above ground, is there much labour to keep the land clean?—No, there is one critical stage in the growth of the crop, and that is the difficulty of getting the crop established. Sometimes we have droughts here, but if we can get the cotton

planted during the rainy season or period in the early spring and the cotton can once get itself established it will stand a good deal of drought, and we do not have a great deal of cultivation to keep it clean.

5932. I was going to ask at what time your rains come?—It generally begins to rain about October; we have light showers then under normal conditions. Last year was abnormal. Then we get a bit more rain in November, but December, January, and February are usually our best months for rain.

5933. Then how long does the cotton take to come to maturity? What do you think is the most favourable month for planting?—About the 1st November, I should say, on the average is the best time; October and November.

5934. How long does it take for a plant to come to maturity?—From the time of planting till the last cotton is housed we need about six or seven months.

5935. Are you free from rains when the bolls are opening?—Yes, that is one big advantage which we have over American farmers. I come from America and I happen to know that they may have a week's rain at the time of cotton picking, but out here we can reckon fairly well on not having any rain at that time.

5936. Then you are not exposed to any boll damage from excessive rain at the time of harvest?—No.

5937. This yield of 2,000 lbs. of seed cotton is very high?—Yes.

5938. What would it give in lint?—It would give to between 500 and 600 lbs. of lint.

5939. That is about one American bale and one-fifth?—Yes.

5940. Can you say whether this particular plot you refer to had been specially fertilised?—It was not fertilised at all. This particular lot that I am thinking about now was grown at the Big Umgazi in the Transkei and in the river valley, where there is beautiful loamy soil which is very fertile.

5941. Is there a very much larger area that is available?—In that part of the country there is a considerable area, but the unfortunate part of it is that all the territory is in the hands of the natives except just round about Port St. John's, where a few miles are in the hands of Europeans, and this lot was grown on a small holding by a European.

5942. Leaving the Native Territory outside, have you much land in the Transvaal suitable for high class cotton-growing?—Yes, thousands of acres.

5943. Then it is simply a matter of the farmer being convinced that cotton is the most profitable proposition?—I would not say it is the most profitable.

5944. No; but I mean that one cannot expect these areas to come under cotton cultivation until it is demonstrable that cotton at the moment is the most payable proposition?—Yes.

5945. And assuming that it is payable, you have large areas?—Yes.

5946. Now, have you any information, speaking generally, in normal times, as to the relative advantages of cotton *versus* tobacco. You have referred to the slump in prices?—I think that even with the low prices at present, tobacco will pay better than cotton, on the average.

5947. Is that on account of the labour which is necessary in picking or the prices?—On account of the fairly good prices that the farmers get.

5948. Now about the relative cost of labour in connexion with cotton and tobacco, what have you to say?—It requires a good deal more labour for tobacco than for cotton. We reckon it takes approximately 10*l.* an acre to produce tobacco and about 2*l.* 10*s.* to 3*l.* to produce cotton.

5949. Then it is not the excessive labour that is keeping cotton back, but it is, at the moment, not the most payable proposition?—That is it.

5950. Has the Government done anything towards providing ginning facilities?—Yes, we have gins standing at present in two or three centres in the country, and in the past we have been ginning cotton for the farmers in those areas, and we, at the present time, gin and bale the cotton for ½*d.* per lb. for the lint. That does not quite cover the cost of ginning, but it is near enough. If we were handling large quantities we could do it possibly at a small profit, but just ginning 200 lbs. here and 500 lbs. there does not pay.

5951. Then the Government is alive to the possibilities of this country as a cotton-producing area?—Yes, we have at the present time ginning plants at two or three centres in the country, and there are two or three private ginning plants.

5952. Have you had any assistance in the way of loans of money or advice by experts from the British Cotton Growing Association in England?—Yes, we have, but it did not pan out very well I am sorry to say.

5953. If it is not divulging State secrets might one inquire the reason?—I think the British Cotton Growing Association has done a lot for cotton-growing in this country, but, unfortunately, in one or two instances it has not proved very successful. In regard to the matter of distributing cotton seed they have helped a great deal, but the unfortunate incident which I have in my mind happened about four years ago when the Cotton Growing Association sent a man out to look after the cotton industry. They were then producing cotton on 200 or 300 acres, and that was practically the only area in the country where cotton was grown. When this 200 or 300 acres was planted the representative of the British Cotton Growing Association went in and undertook to buy the cotton from the farmers, paying them 1½*d.* per lb. or so for the seed cotton. He took the cotton over, ginned it in this particular area, and shipped it away to England, and his agreement with them was, when they sold it, that if he got more than a certain figure per lb. they were to get a bonus. Now, some of these farmers spoke to me twelve months afterwards and said they had never heard anything more about the bonus. They had to wait many months and got dispirited and some of them quitted the business. And then to add insult to injury they had to pay rather heavy rates to get the cotton away to market. This particular area that I am speaking about was 80 miles from the railway, and it cost 2*s.* per cwt. to get the cotton shifted to the railway. Then there were the railway rates on the cotton to the coast, and when they had paid this 2*s.* and the railway rates to Durban or Delagoa Bay and the ocean freight to England there was not very much left for them.

5954. Then, evidently, the experiment was carried out when the facilities for getting cotton to market were very bad?—Yes; but it was thought that that would be the most likely area for the growing of cotton, although it was far away from the railway. Since then, therefore, I have looked round for other districts, and I feel that the Rustenburg District is quite as good for this purpose as the other place, and it is nearer to the rail. We are now pushing the work ahead in that district, and the outlook is quite satisfactory for the present.

5955. With all these heavy rates and charges on the cotton it is quite conceivable that, after all, the British Cotton Growing Association may not have made any profit on that cotton, and, in fact, they may have made a loss?—I think it very likely that they did make a loss; it worked unfortunately both ways.

5956. **(Sir Jan Langerman.)** What is the predominant constituent required in the soil in order to grow cotton successfully? Do you want a lot of lime?—Well, we have carried out some experiments in this direction, and we find that lime does not make very much difference. In one district the limed portions of the land gave a little bit more cotton than the portions obtaining no lime, but in another district I could not see any difference in the yield of cotton as regards lime, so I have come to the conclusion that lime does not seriously alter the yield.

5957. What is the temperature necessary for growing cotton? What is the highest and lowest?—Well, we find here that we can grow cotton best in

what is known as the middle veldt and low veldt. The Rustenburg District is typical middle veldt, there we have frosts in about three months of the year, but they are only light frosts, and for the rest of the year we get no frosts.

5958. What amount of frost would it be, would it be three degrees?—Sometimes it goes down possibly as low as five degrees.

5959. Would that injure the plant?—The cotton is all gone when these frosts come. The cotton that we are growing here, the American Upland varieties, would be all picked by the end of April or May, and then we destroy the field of cotton entirely and replant for the next crop in the spring. This variety which we are growing is an annual variety; the perennials we have not been very successful with in this country, one reason being that we have one or two insects, like the red stainer, that hibernate on these trees during the winter months and damage the crops next year.

5960. Do you employ native women and children on this work of picking?—Yes, and we find it is very good. They will not pick as much, possibly, as a man, but they are not so expensive.

5961. Then it will give them employment?—Yes.

5962. Where the men fail you will be able to use the women and children?—Yes; half-grown picaninnies will pick 40 to 60 lbs. of seed cotton a day.

5963. **(Chairman.)** At what cost?—About 6*d.* a day. They are really cheaper labour than full-grown men.

5964. **(Sir Jan Langerman.)** So the scarcity of adult labour could be made up by women and children?—Yes.

5965. In regard to the rainfall, do you want a lot of rain?—A fair amount; but we think we can produce cotton very nicely if we get 20 inches.

5966. That is a good deal?—It sounds a good deal, but where we have a temperature of 98° to 105° it takes a lot of moisture out of the soil.

5967. That depends largely on cultivation?—Yes, to a certain extent. When I say 20 inches of rain I am keeping myself well on the safe side. I think we could do it with less if we had the rain at the right time.

5968. You do not want rain on the plant when it is in full bearing?—No.

5969. Does it injure the cotton at all?—If it rains on it when the boll is open it injures the cotton slightly, but not seriously.

5970. Can you sketch the process of cotton-growing shortly?—Well, we first prepare our ground similarly to the way we prepare it for mealies, then we lay off the rows and plant with a cotton planter or a mealie planter. We drill the seed in at the rate of about 15 lbs. of seed to the acre, putting the rows about 4 feet apart, and then we do ordinary scoffling, the same as for mealies, when the plants are from 4 to 6 inches high, thin them, leaving the trees about 18 inches apart in the rows. Then we keep scoffling about 2 inches deep, and continue this until the squares begin to form for the bolls; when the squares begin to form we cease cultivation, because there is danger of making the squares drop off. And then there is no more work until the cotton is ready for picking.

5971. What would it cost an acre to grow cotton?—We estimate from 2*l.* 10*s.* to 3*l.* an acre, it depends on the yield, but say by the 1,000 lbs. weight, of seed cotton per acre, that could be done at a cost of probably 2*l.* 10*s.* or 3*l.*

5972. That is 1,000 lbs. an acre?—Yes.

5973. Is that raw or ginned?—Unginned cotton with the seed in it.

5974. What would be the value of such land?—I should say they would value land of that kind in this country at about 2*l.* an acre possibly.

5975. What would the income be per acre, the net profit?—To be conservative I should say about 6*l.* an acre.

5976. Well, that is a very good return on 2*l.* 10*s.*?—Yes, it is not bad.

5977. And you think there is a good field for this crop?—Yes, I think that once we get cotton established in the country we shall find that it will pay better than mealies. We have already had a number of demonstrations side by side in certain districts, and the farmers themselves have joined in these experiments and they find they have got two or three times as much from their cotton as from their mealies, and in some cases where they had severe drought they would get nothing from their mealies, but would get a fair crop of cotton.

5978. Do you know the various districts in this Province?—Yes.

5979. How about Lichtenburg, would that district answer for cotton?—I think it would do fairly well, it is just a question of whether you have sufficient rain.

5980. The rainfall is considered to be about 18 inches?—Yes, that would be sufficient if it came at the right time, that is from the time of planting until the young plants get a good hold. But suppose you planted cotton in November and you did not have any rain until February, your cotton would naturally come to nothing.

5981. **(Sir Alfred Bateman.)** This year cotton will not be a payable proposition will it, if you have planted 8,000 acres and only 1,000 are going to come to maturity?—I should explain that this is in the Rustenburg District, where the drought has been extremely severe, and a great many farmers who planted mealies in this district have none at all. This 1,000 acres that I have referred to represents small isolated areas where they got one or two showers of rain at the right time. In other areas where a lot of planting was done they had no rain at all, that is during November, December, and January.

5982. I suppose if you advocate cotton-growing to these people they would rather come down on you if they planted and got no profit?—Yes, naturally they would, but if they had a reasonable season they would do much better with cotton. I have heard a good many farmers say that they have planted cotton and mealies in the same fields, but the mealies have dried up in the fields and are only a foot to 18 inches high, at the same time their cotton plants are standing there a foot high and green to the ground. These farmers say that cotton plants will stand drought a great deal better than mealies, even if they do not make a crop.

5983. They are content to regard it as an experiment?—Yes, and they have already inquired for seed, and will plant more next year.

5984. Have you had anything to do with the Imperial Institute in London about cotton?—No, except that I believe we have sent them a few samples to get a report on the quality.

5985. Because they get reports for the various parts of the Empire and consult brokers as to commercial values, &c. Have you received their reports?—No.

5986. But you sent them samples?—Yes. I had a report immediately on that.

5987. Do you get the *Bulletin* of the Imperial Institute sent to you?—Yes, we get it in the Library.

5988. **(Mr. Sinclair.)** Did I understand you to say that you thought tobacco-growing was more profitable than cotton?—I think so, on the average.

5989. One of your difficulties in regard to tobacco-growing is to find a market, is it not?—Yes, that seems to be the difficulty at the present time.

5990. Is it the case that there is a large proportion of the last crop stored locally?—There is a considerable quantity in Rustenburg, but there is a combination of difficulties which may require a bit of explaining. For the past year or two we have had severe droughts. We have had two years with no rain at the right time, and the crop of tobacco grown twelve months ago is the one which we have a considerable quantity of in the warehouse. It was grown principally from January to April, and was housed when the winter months came on, so it did not have the proper sunshine to mature it

properly, and consequently a lot of it cured out green and dark-coloured, whereas if it had cured out yellow, as the tobacco did in former years, there would have been a ready market. The market is fairly good for bright tobacco, but they have an over-stock of this cheap grade.

5991. You do not think that the result will be that less tobacco will be grown during the next few years?—No, I do not think it will seriously alter the crop for the next few years. Each year we have an increased import of tobacco into the country. We have more than 1,000,000 lbs. of tobacco imported each year, and that would indicate that we had an under-supply, as I think we have, of the higher-grade stuff. We have about 1½ million lbs. of cheap-grade tobacco in the warehouses at present.

5992. How long do you suppose it will take to work that off?—I think about twelve months in view of the fact that they have had another bad year on the top of the last one.

5993. **(Chairman.)** How much cotton do you think will be planted next year?—It is rather hard to say, because it is impossible to predict what the seasons will be like, but I think there will be about the same as this year, that is 8,000 to 10,000 acres possibly.

5994. Does that include the coast districts?—No, because I do not reckon on a great deal being planted there. It might be 400 or 500 acres.

5995. Do you consider then that the upland districts are more suited to cotton than the sea coast districts?—Yes, that is the immediate sea coast, because on the coast it is very windy. But 20 miles inland from East London and in the Transkei there is magnificent land for cotton and every indication that cotton will do extremely well.

5996. You said it pays less than tobacco. Does it pay more than other payable crops?—I think it would pay better than mealies on the average.

5997. Is it suited to the same lands as fruit-growing?—Yes, very much the same, that is citrus fruit-trees, not apples.

5998. Would it be more payable than citrus fruit?—No, I do not think so, but I may explain that the advantage of cotton is this, that you can grow cotton on large areas in the country where you cannot grow citrus fruits, because you have no need of irrigation to grow cotton, whereas you must have irrigation to produce citrus fruits.

5999. Compared with the Southern States of America what is the cost of labour here for cotton How do the figures you have given us compare with your experience of the Southern States of America?—So far as the labour itself is concerned it runs pretty much the same. We pay a little more in America for our labour, but we get four times as much for it.

6000. How does it compare in regard to payment for result?—I think we can get better results in America, because even if we paid twice as much we get four times the result. In this country we hire a raw Kaffir, for example, and put him to look after one acre of tobacco and sometimes two Kaffirs to look after one acre, whereas in the States each individual, whether white or black, would handle four or five acres of tobacco.

6001. Then the remuneration of the men here is half what it is in America?—Yes, about half.

6002. **(Mr. Garnett.)** Is it as high as that. You said 1s. a day. But in Texas they pay a great deal more than that surely?—Not all the year round.

6003. But for pickers in the picking season?—Yes, just in the picking season they might pay more.

6004. How has the plant stood up in these extreme droughts against pests?—The insects have not troubled them seriously through the drought.

6005. What pests have you?—The red stainer gives us the most trouble.

6006. Have you the boll weevil?—No. Another pest is the boll worm, not the boll weevil. In some parts of the country we have not been troubled and in others we have. But we find this red stainer in every part of the country as soon as we plant our cotton. But if we get our cotton planted fairly early we get it matured without much damage.

6007–21. **(Chairman.)** In ten years' time would you look for a large production of cotton in South Africa?—Well, there is a chance. It all depends on the farmers. The farmers in this country, you know, do not get at the work quite as hard as you would like to see them. They take it rather quietly and depend on the natives to a certain extent.

LIST OF APPENDICES.

(b) Cotton.

APPENDIX I.

Johannesburg, Friday, 3rd April 1914.

EVIDENCE given by Mr. REGINALD R. SMITH, Cotton Expert, before a COMMITTEE of the COMMISSION, consisting of Sir RIDER HAGGARD and Mr. T. GARNETT.

(Witness.) I acted as manager to the Cotton Growers' Association on the West Coast of Africa in the Nigeria hinterland. I have also farmed in this country. I spent this last year in the East London district with the intention of studying the question of cotton-growing there. I am of opinion that the coastal belt extending from Port Elizabeth to Natal should prove an excellent district for the production of cotton.

1. **(Sir Rider Haggard.)** You have read the evidence of Mr. Scherffius, and do you confirm generally what is there said?—I wish in the first place to make a slight correction in connexion with Mr. Scherffius's evidence. He refers to the action of the British Cotton Growing Association in the Zoutspansburg district as causing an injury to the industry and the farmer. I would like to point out that the British Cotton Growing Association were not operating up there, but a company altogether independent of the Association, which was purely a commercial undertaking. The British Cotton-Growing Association were not responsible for what occurred.

I went to East London, having heard that there excellent cotton had been produced. I put forward

the suggestion for the formation of an Association on the lines adopted by my old Association, that is to say, I was satisfied with the cotton possibilities of the belt, having seen excellent specimens of cotton, some of which specimens had stood for from nine to twenty years.

This cotton is the old Orleans cotton, some of which plants I found to be still bearing exceptionally heavy crops. I came to the conclusion that this district can produce an excellent cotton, giving higher yields than any district I have yet visited.

2. **(Mr. Garnett.)** When I was in East London I went out some 25 miles to the farm Anglers' Home, belonging to Mr. Pickstone, where he has some 25 acres under cotton in the first year. You do not happen to have been through Mr. Brown's land?—No. He came into the district just about the time I left it. I have correspondence from Mr. Pickstone, who was quite prepared to support an association on the lines I put forward.

3. Are you speaking for the Transvaal? — No. I speak for the coastal district. In the Richmond district of Natal, which I visited last year, efforts were being made to introduce cotton. As regards climate and soil it is a very suitable region for the growth of cotton. Rainfall comes at the right time for planting, and the dry season at the right time for picking.

4. Have you formed any opinion as to the best variety of cotton to grow. You know the great demand now is for a staple 1½ inches long. There is a great scarcity of American cotton of that length, 1½ inches or roundabout. Have you arrived at any conclusion as to what would be the best cotton to grow?—We have two cottons that give about that length of staple. One is the American Toole and the other is the Nyassaland Upland. From American Toole an estimated net profit of 22*l.* per acre was obtained last year at St. John's, while Nyassaland gave an estimated net profit of 16*l.* 12*s.* per acre.

The results of the experiment carried out under the Government expert's supervision at Port St. John's are as follows:—

	£	*s.*	*d.*
Sea Island:—			
1,369 lbs. seed cotton per acre, at 3*d.* per lb.	17	2	3
Less cost of production	3	10	0
Estimated net profit per acre	13	12	3
Mitafifi:—			
1,285 lbs. seed cotton per acre, 3*d.*	16	1	3
Less cost of production	3	0	0
Estimated net profit per acre	13	1	3
American Toole:—			
2,067 lbs.	25	16	9
Less	3	10	0
Estimated net profit per acre	22	6	9
Nyasaland Upland:—			
1,548 lbs. seed cotton, at 3*d.*	19	12	0
Less	3	0	0
	16	12	0
Cleveland Big Boll:—			
1,010 lbs. seed cotton, at 3*d.*	12	12	6
Less cost production	2	15	0
Estimated profit per acre	9	17	6
Herlong:—			
810 lbs. seed cotton per acre	10	2	6
Less	2	15	0
Estimated profit per acre	7	7	6

The lowest net profit per acre obtained was 7*l.* 7*s.* 6*d.* Had the better cotton been ginned and sold as lint a bigger price would have been obtained than when sold as seed cotton, much of the lint changing hands in Liverpool at 1*s.* per lb.

The value of cotton seed, too, is not yet recognised, and is not as a rule taken into account when estimating the value of the crop.

At present Liverpool selling prices, that means American bale and a half to the acre or roundabout.

Sea Island, although quoted in above list at 1,369 lbs., has produced up to 3,000 lbs. per acre of cotton.

5. What about lint?—It generally runs about 27 per cent. lint. Egyptian has done very well, and with Egyptian cotton it seems to be the custom in the East London district to ratoon and grow as a triennial. The plants of the old cotton, which I was informed were from nine to twenty years old, were still healthy and very heavy in fruit. Referring to this cotton, some fifty years ago an old report puts the net yield per acre at 613 lbs. lint cotton, which roughly represents 1,830 lbs. seed cotton, a yield which would be regarded as "big" on the best plantations in America.

6. Can you say the length?—It is seven-eighths inch harsh –

7. The demand for cotton as you know is for 1½ inch staple. There is a great opening for cotton at a reasonable price. How does it resist pests?—The fact that the cotton had stood for such a number of years untended was sufficient evidence of its immunity from pests. Outside the Government station the only pest I found was the stainer.

8. Are there no boll worms?—No; boll weevil is unknown in these parts.

9. With regard to labour, do you think there would be much difficulty in getting native labour to take up cotton-picking. I do not think so. Once the crop was introduced on to the farms there would be no difficulty. I may say that in that district you are surrounded with natives. Pondoland on one side and Kaffraria on the other are native reserves. Once introduced on the farms these native districts would also open up new fields for cotton. In other parts of the world it is a favourite native crop. On some farms in the immediate vicinity of the towns labour is difficult to obtain, but on the outside farms I do not think there is the slightest trouble with labour.

There are considerable areas in this country suitable for cotton-growing, should it be proved a profitable crop from an economic point of view. It is a more attractive crop than any other. My opinion is that it only requires to be introduced on scientific lines to the farmers. In travelling about in the country I always found the farmers anxious for information on the crop, and they could, I believe, be easily induced to adopt the crop, but no farmer will take on the experimental work himself. This is the duty of the Government. It is a profitable crop, but until recently no local market existed for small lots, and as no farmer will take up the cultivation of a *new* crop on a large scale, that is, until it has been tested, the crop has been almost entirely neglected.

On many of the farms that I visited I found the soil to have become exhausted by continual cropping of maize year after year; in some cases they had to fertilise heavily with superphosphates in order to obtain a crop of any sort. Cotton would prove of great benefit either as a substitute for or in a rotation with maize. It is less exhausting, and as many of these farms are remote from the railway, it is a very desirable crop, owing to its comparative value when considered with its weight. I found, sir, that the farmers of these districts were anxious to take to the crop. Had they a guaranteed price for the product, which I believe the British Cotton Growing Association would grant, it would undoubtedly assist in the establishment of the crop.

The oil is a valuable product, and after its extraction you have still the cake, also a valuable commercial commodity. The fibre, which is the lightest part, is transported, the seed is retained, and if fed to cattle returned to the land. Thus the fertility of the land is maintained. In the exportation of maize Africa cannot but lose in fertility.

10. Would you agree with this as a general proposition, that it would be a misfortune to proceed too quickly or on too large a scale, unless it was absolutely demonstrable that it was going to pay the farmer better than tobacco, mealies, or any other pro-

duct of the soil?—I would not introduce the crop on too large a scale on individual farms; I would suggest the *gradual* introduction in small lots of, say, 10 to 20 acres on each farm.

11. Of course, you have read the correspondence between the Cotton Growing Association and the Commonwealth and Queensland Governments. Do you favour an attempt being made to make such an arrangement with the British Cotton Growing Association to give the grower a guaranteed price for a number of years, and after deducting the cost, insurance, freight, and landing charges at the other end, to return any surplus. In that case the British Cotton Growing Association is standing the loss, but the farmer is in the position of having a guaranteed price, and in addition he gets any profit over and above that price, as the loss, if any, is to be borne by the Association?—That certainly would assist in the establishment of the industry.

12. Do you think it would be a good thing?—I do think so. It would be an excellent thing for South Africa to come to such an arrangement with the Cotton Growing Association. I should like to point out also that in introducing a crop like cotton, which is a very valuable crop, it would tend to split up large farms into small ones. Cotton is a small man's proposition. For some districts such as the Albany and Peddie, excellent agricultural districts, but remote from the railway, cotton would be a splendid crop. The difficulty of transport in these districts is very great, and many of the fruit and grain crops do not pay to transport to the railway. At present, too, they are tied up with the East Coast fever regulations, and many farms there are going gradually into the hands of the natives. It is my opinion that cotton would tend to save these districts, the freight on the fibre being such a small item. In 1912 in the outside districts maize sold at 10*s.* per bag, many farmers having lost their stock were paying the Government 3*s.* per bag for transport. Cotton could stand this high charge but maize could not.

12*a*. I gather that you are an enthusiast in cotton-growing.—The figures obtained are exceptionally high. In America, 200 lbs. of lint or a net profit of 3*l.* per acre is generally considered a fair average. Even in Egyyt, a country of wonderful fertility, perennially fertilised as it is by the flood waters of the Nile, a net profit of 17*l.* per acre is considered high.

To compare the price of land in America, land in the cotton belt commands 20*l.* per acre. In Egypt it fetches from 60*l.* to 100*l.* per acre, while here on the coast the ruling price is from 2*l.* to 3*l.* per acre. My object in putting forward the scheme for the formation of an association was to obtain the co-operation of the farmer, the Chamber of Commerce, and of the merchants, and later that of the British Cotton Growing Association, the shipping company, and the Government. I obtained the co-operation of a number of farmers and also of a number of gentlemen in East London, but unfortunately our labour troubles upset the whole thing.

13. Have you satisfied yourself that cotton can be grown commercially at a profit in South Africa?—I have not grown it in South Africa, but I have grown it on the West Coast of Africa, north of Lagos, where I was in charge of an experimental station. Money has been spent liberally spent in tropical Africa, but might I point out that the money which is being spent in these Colonies of the tropics, in conjunction with Government subsidies, is being spent in what is, and can never be other than, purely native countries. On our coastal belt the farms are of considerable extent, while the area cultivated is very small, and I hold that were we to introduce cotton it would revolutionise the whole district. Other countries of Africa, countries without our advantages, are attracting money for the purpose of exploiting their cotton districts, and of this I would like to attract some to South Africa. I would particularly draw your attention to the fact that here you have cheap soil, you have a suitable climate, and abundant labour, the three things requisite.

Another point worth noting, I spent some time on the Mission Station of Lovedale, and Mr. Henderson, the principal, was quite prepared and anxious to co-operate in such a scheme, on account of the fact that not only would it introduce into a huge native population such as Kaffraria and Pondoland a new industry, but you would make the industries of weaving and spinning possible in those native districts; the cotton could be planted along with the maize; it is not a system which I recommend, but it is a method which suits the native farmer. That, in the aggregate, would contribute very considerably to the amount produced.

14. Have you laid your views before the Agricultural Department, and what have they answered you?—They are prepared to assist to the extent of a subsidy on the pound for pound basis, but the whole matter is at present hung up on account of the fact that it is too late for planting this season.

APPENDIX II.

(A)

NOTES by Mr. T. GARNETT on a VISIT to the CHALUMNA COTTON PLANTATIONS, "ANGLER'S HOME" FARM, EAST LONDON, the property of Mr. H. E. V. Pickstone, 16th March 1914.

This estate is situated on the banks of the Chalumna River, about 3 miles from its mouth and 25 miles distant from East London.

It consists of some 1,000 acres, of which 300 are rolling down land, clothed with verdant herbage, and well adapted for grazing cattle and the raising of grain crops.

The remaining 300 acres are alluvial flats of very rich chocolate soil, lying along the banks of the stream.

About 100 acres have been put under cultivation by Mr. N. F. Howe Browne, Mr. Pickstone's managing partner, viz., 25 acres under mealies, 15 acres under cow peas, 60 acres under cotton

The varieties of cotton planted are "Allen's Long Staple" and "Webber," from which it is hoped to raise fibre 1⅛ inches in length.

To shelter the plants from the south-east gales of October and November, bananas have been planted as "wind-breaks." On the north-west the range of downs affords a certain amount of protection to the low land.

All the plants looked healthy and free from pests, and the ground was very clean and clear of weeds.

The more forward plants were the "Allen Long Staple," mostly just coming into flower. Picking was expected to take place in May.

I opened some immature bolls, which contained silky cotton, promising long staple.

"Angler's Home" was chosen by Mr. Pickstone and Mr. Howe Browne—after careful examination of many properties—as being eminently suitable for cotton-growing, and their experiment will be watched with sympathetic interest by all who wish to see an increase in the production of the staple.

(B)

REPORT by Mr. N. F. HOWE BROWNE on the FIRST CROP of COTTON from the CHALUMNA COTTON PLANTATIONS, EAST LONDON.

(*See page 329: the Report arrived too late for insertion on this page).*

APPENDIX III.

EXTRACT FROM STATEMENT HANDED IN BY THE TRANSVAAL AGRICULTURAL UNION.

(*For evidence of the representatives of the Transvaal Agricultural Union on "Animal and Agricultural Produce," see page 254, and for other portions of their statement, relating to "Irrigation" and "Fruit" see pages 52 and 320.*)

Cotton.

Experiments have been made in respect of cotton-growing, but the data to hand are not sufficiently complete to enable a judgment to be formed as to whether or not the crop could be made a paying one in the areas which are suitable for its cultivation. One of the main factors in the securing of success is that of being able to rely upon a sufficiently cheap and efficient supply of labour.

Drawbacks.

Those who have experimented with this crop state that, though they might be able to overcome the labour difficulties, they are still placed at a disadvantage owing to the fact that railway charges render it impossible for them to dispose of their cotton seed, which would find a ready market in the Province. The same remark applies to growers of soya beans who happen to farm at a distance from the centres where their products could be used for the extraction of oil. One such grower, who otherwise regards the crop as a profitable one, has given up its cultivation.

Another serious drawback to the agriculturist is the impossibility of making a profitable use of the enormous amounts of kraal manure which have been deposited during the periodical treks of stock farmers for many years past.

(c) Forests.

CAPE OF GOOD HOPE.

Cape Town, Wednesday, 25th February 1914.

Mr. CHARLES E. LEGAT, Chief Conservator of Forests, Union of South Africa, called and examined.

6022. **(Chairman.)** You have been good enough to write to the Commission giving details as to the forests of the Union?—Yes.

The following is the communication referred to:—

Forest Department,
Office of the Chief Conservator
of Forests, Pretoria,
8th January 1914.

1. *Extent of Indigenous Forests and Plantations.*—In comparison with the size of the country the indigenous forests in South Africa are very small, not amounting to more than $\frac{1}{10}$th per cent. of the total area. The area of the Union of South Africa is 473,954 square miles and of this only approximately 450,000 acres are covered with indigenous forests. The area planted with exotic trees up to the 31st March 1913 amounted to 61,062 acres, of which 50 per cent. consists of pines and firs.

2. *Locality of Indigenous Forests.*—The forests lie mainly along the mountain ranges within a couple of hundred miles of the southern and south-eastern coasts; further inland they occur in localities having a high rainfall.

3. *Yield of South African Forests and Import of Timber.*—The output of the forests is not nearly sufficient to meet the needs of the growing population, as will be seen from the following table showing the quantity and value of the various unmanufactured timbers imported into the Union during 1912:—

	Cubic Feet.	Value.
		£
Teak	93,586	29,361
Hickory	76,946	10,177
Jarrah	218,505	13,401
Mahogany	11,318	3,111
Oak	137,116	18,231
Pine	7,208,590	399,309
Poplar	98,785	14,194
Walnut	101,320	12,706
All other (not otherwise described).	2,243,590	117,763
	10,189,756	618,253

4. The exports of South African woods during 1912 were:—

	Value.
	£
Boxwood	3,593
Stinkwood	55
Teak	4
All other	38
	£3,690

Boxwood is mainly used by cotton factories in England in the manufacture of bobbins.

5. The present output of timber from the State forests of the Union is roughly 1,000,000 cubic feet per annum.

6. *Utility of South African Timber.*—The woods of the indigenous species are highly esteemed for wagon and carriage building, and are found to surpass imported woods for durability and strength. The chief wagon woods are stinkwood, white pear, assegai, ironwood, flat crown, and yellow wood, while yellow wood has been and still is used to a considerable extent for purposes for which pine timber is used in Europe, such as flooring and ceiling. Yellow wood is also very largely used in the manufacture of sleepers, its lightness, power of absorbing creosote, and of holding spikes make it specially suitable for sleepers. Sneezewood, the most durable of all woods, meets to a large extent the demand for fencing poles. Stinkwood, however, is the most valuable timber in Africa, for which the demand is greater than the supply. Besides being used in wagon-making, it is most highly esteemed for furniture-making and panelling, on account of its beautiful appearance and extreme toughness. Articles of stinkwood furniture become handsomer with age. Good stinkwood will fetch 10*s.* to 12*s.* a cubic foot at the Cape.

7. *Forest Department as Employer of Labour.*—Some 1,200 to 1,500 people directly derive their livelihood from the State forests, and if allowance is made for their families, three to four times as many are dependent upon them.

8. *Management and Control of Forests.*—Until the last session of Parliament, the forests of the several Provinces of the Union were administered under different Acts. The Union Forest Act became law in the 1913 session, and it provides for the acquisition of land for forest purposes, for the demarcation of forest reserves and, generally, for the regulation of the forests of the State. It prescribes what acts shall be punishable and the forms of punishment.

9. With this Act as the basis for the management of the forests, the objects of the Department may be briefly described as follows:—Firstly, to conserve the indigenous forests and utilise their products in such a way as not to impair, but rather increase, their future productivity. Secondly, to increase the production of timber in the country by the formation and proper management of plantations of exotic trees—the eucalypts of Australia and pines of Southern Europe, California, and Mexico. The earlier plantations are beginning to yield returns from thinnings, but mature timber will not be ready for cutting for some years. Thirdly, to encourage the general afforestation of the country by tree-planting by farmers and others for purposes of shelter, fuel, ornament, &c., and for these purposes forest trees and seeds are sold at very low prices. During the past financial year 2,831,074 trans-plants were sold from Government nurseries and 395,763 issued gratuitously.

10. *Staff.*—The executive forest staff consists of 149 officers on the permanent establishment, of whom 36 belong to the senior staff and 113 to the subordinate ranks. The senior staff is now being recruited, as far as possible, from students of recognised European and American forest schools, while training for the subordinate forest officer is provided at a forest school at Tokai, in the Cape Peninsula.

The Wattle Industry.—Special mention should be made of this industry, which, although an important one in the Union at the moment, promises to become considerably more so in time. Wattle cultivation has been almost entirely carried out by private enterprise in Natal. Probably there are more than 250,000 acres of wattle plantation in South Africa. The amount and value of bark exported annually is as follows:—

Year.	Lbs.	Value.
		£
1906	33,215,466	89,374
1907	54,478,492	139,397
1908	55,661,949	134,563
1909	80,127,399	194,699
1910	92,610,026	219,433
1911	111,205,265	289,557
1912	118,219,023	283,060

The following return shows the centres to which wattle bark was actually exported during 1912, viz.:—

From	Country.	Quantity.	Value.
		Lbs.	£
Natal	Europe	100,213,684	243,287
	Australia	16,072,668	35,890
	New Zealand	1,475,306	2,975
	Other countries	99,112	270
Cape	Europe	353,773	623
	New Zealand	4,480	15
	Total	118,219,023	283,060

It is interesting to note the large shipments to Australia, the home of the black wattle (*Acacia decurrens, var. mollissima*).

The prices for South African bark on the European markets during 1912 were:—

——	Highest price.	Lowest price.
Natal.	£ *s.* *d.*	£ *s.* *d.*
Chopped bark	8 0 0	6 16 3
Ground bark	8 5 0	7 7 6
Cape.		
Chopped bark	7 5 0	7 5 0

Very little has been done in the export of bark by the Government, as Government plantations have been formed primarily for the purpose of protection of indigenous forests from fire. The main market for wattle bark is Germany, and it obtains its supplies largely from the German possessions in Africa and from the Union. From recent reports it would appear that the German market is being glutted, with the result that prices will, no doubt, suffer considerably. The time appears, therefore, to have arrived to find other markets—within the Dominions and out of them—for wattle bark, and this, no doubt, is a matter which, in view of its importance, will have the Commission's careful consideration in the work which it has in view. A further point for consideration in regard to this industry appears to be the need for exporting the extract of the bark and not the bark itself.

6023. **(Sir Rider Haggard.)** Your area of forests and forest lands is very small?—Yes.

6024. One of the smallest of any country, is it not?—Yes, I should think so.

6025. Your forests lie, I suppose, in kloofs and mountains?—Not entirely. They also occur, especially at Krugana, on the flats between the mountains and the sea.

6026. Have the forest lands been much wasted?—Yes, a good deal has been.

6027. Has it been destroyed?—Very much so, especially any that has fallen into the hands of the natives.

6028. Is a stop being put to it now?—Yes, as far as possible.

6029. What you have now is properly conserved?—Yes.

6030. I observe that you import an enormous amount of timber?—Yes, we do.

6031. There is, then a large demand for timber if it could be produced locally?—No doubt of it.

6032. Among these South African timbers you have some which are very valuable, I believe?—Yes, such as stinkwood and yellow-wood. Probably stinkwood is the most valuable.

6033. There used to be a beautiful wood called beukenhout. I think?—There are several species of trees which pass under that name.

6034. And these woods you are now conserving as best you can?—Yes.

6035. Are they of slow growth or rapid?—Slow.

6036. Can you replant them or do you trust to natural afforestation?—To natural afforestation mainly.

6037. They will re-afforest themselves?—Yes, they do so.

6038. How long does it take for one of these indigenous valuable woods to come to a profitable cutting size?—We have no definite information, but it is probable that, in the case of stinkwood, it would take from 80 to 100 years.

6039. Which is not more than an oak?—No.

6040. Therefore, it is a valuable wood to increase?—Yes.

6041. And you are trying to do so?—Yes, as far as possible.

6042. Sneezewood is one of the most durable, is it not?—Yes.

6043. As durable as teak?—Quite as durable in the ground, I should think.

6044. Does your Forest Department employ a large amount of labour?—We have a good many people. The white staff of the Department is at present about 200.

6045. And a good many natives as understrappers?—The people I refer to are on the establishment. In addition we employ natives as forest guards, who are not included in the number I have given.

6046. It employs many men?—Yes. It should be understood that these figures apply only to the staff of the Department. About 1,500 people depend on the forests for a livelihood.

6047. Are you planting at all?—Yes, a good deal.

6048. What do you plant?—Pines and eucalyptus principally.

6049. Which pines do you plant?—In the western area we plant the pines from the Mediterranean countries, such as the Cluster pine and Aleppo pine, *P. insignis* from California, and *P. Canariensis* from the Canary Islands. Inland, *P. longifolia* from India and Mexican pines are being tried.

6050. Which do the best?—In this area you will see the Cluster pine and Stone pine are naturalised.

6051. They are not the best timber, are they?—No, but they are suitable for many purposes.

6052. They are naturalising themselves?—Yes.

6053. How many acres a year do you plant?—About 10 square miles a year.

6054. And you do that every year?—Yes, lately.

6055. On Government ground?—Yes.

6056. Are you going to increase?—Perhaps slightly, but we do not intend to go ahead too quickly.

6057. Are you getting any returns?—From thinnings we do. We have no final returns except in the case of one gum plantation. That was planted in 1876 and cut over in 1892 and 1893, and it is to be cut over again very shortly, but it is only a mining timber plantation.

6058. Do you expect this policy will be a financial success?—I think there is every reason to suppose so.

6059. Therefore it might be increased with advantage?—Yes, I think it would be wise to go on steadily.

6060. How about wattle?—It is grown very largely, especially in Natal and certain parts of the Transvaal, and in the Eastern Cape Colony, also the Transkei. In these places it thrives.

6061. The bark is used for tanning?—Yes.

6062. And is the wood used for props?—Yes.

6063. Is the market limited for wattle?—Lately there have been signs that the market is going down. Production is going up, so much so that there has been a tendency for prices to drop.

6064. Is it your conclusion that perhaps enough wattle has been planted and it would be wiser to devote attention to other kinds of trees?—Unless the markets can be improved it would be, certainly.

6065. For timber generally in South Africa—conifers or hard-woods—I suppose there is a large market?—Yes.

6066. And one in excess of any likelihood of its being fully supplied for a long while to come?—Yes.

6067. Therefore it would seem that afforestation is a good and a sound policy?—Yes.

6068. **(Sir Jan Langerman.)** What do you do in regard to extending your plantations of indigenous trees?—Indigenous forests regenerate themselves. The area under natural forest is cut over in such a manner that the young growth takes the place of the old growth.

6069. On the same spot?—Yes.

6070. You do not plant it?—Not extensively. We surround our natural forests with wattle belts to protect them from fire, and we have found that the natural bush spreads into the artificial area and extends.

6071. Seeds blow away?—Yes, and birds carry them.

6072. In view of the valuable wood we have, would it not be advantageous to create plantations of indigenous trees?—Yes, it would, but we find that these trees are very shy of being planted out in the open. They like shade. We have planted them here and there experimentally outside the forest areas without much success.

6073. Where does the wood they use for fruit boxes come from?—It is mostly imported from Sweden.

6074. Could we not utilise ours?—We find the *insignis* pinewood is suitable, but the quantity available at present is insignificant.

6075. What is the tendency among the public? Is it to plant trees or do not they care to do so?—I think there has been a very great deal done by private enterprise in the last few years. Last year's annual report showed that we sent out to the public 3¼ million trees to plant for shelter and fuel purposes, and to supply rough timber for farming purposes.

6076. **(Sir Rider Haggard.)** You do not distribute fruit trees?—No.

6077. I see you import a lot of teak, and there is only a very small export. Is that a re-export?—No, I do not think so. We have no true teak. It is probably South African—not the true teak—that is referred to.

6078. What is the South African teak?—I think this refers to the wood of a strychnos.

6079. **(Mr. Lorimer.)** I notice you speak very highly of the value of stinkwood?—Yes.

6080. And there has only been 55*l.* of it shipped?—Yes, because it can all be used here locally.

6081. Is there none goes abroad?—None. All of it is used on the spot.

6082. It is sold for 10*s* and 12*s*. per cubic foot, I see?—Yes, in Cape Town.

6083. A high price?—Yes, but if we can get that here, it would cost still more across the water, and it is very heavy to transport.

6084. In England, people would pay that for high class wood?—I am sure there would be a very ready sale if it were available, but there is not sufficient for our own requirements.

6085. Is it a quick-growing timber?—No, not very.

6086. Are you planting it?—It grows naturally in the forest. It reproduces well. It grows very strongly from stool shoots. When it is cut over it coppices very freely. It also seeds itself.

6087. There is not much likelihood of any quantity being exported?—I do not think there is any hope of it. I think the demand here will always be big. It is a very favourite wood for wagon work. Farmers prize it very highly, and it is very highly esteemed for panelling and furniture.

6088. For farm wagons it is hardly worth paying that price?—It is very durable wood, and I suppose farmers think it pays them better in the long run.

6089. Is there any other timber that brings such a price?—No, it is the most valuable we have.

6090. I suppose you have been asked about wattle bark; why does so little go to England?—English tanners will not be bothered with bark in the rough. They want an extract. They must have solid extract, and so most of it is sent to Germany. Now there is a tendency for the supply of bark to exceed the demand. Bark is being sent from here, British East Africa, and German East Afriea, and there are signs of the market getting overstoeked.

6091. Have you any faeilities to extract?—No, I am told that the growers in Natal are giving the matter attention, and are also trying to get markets in America and other plaees for the bark.

6092. Supposing you extracted it, would what remained do for firewood?—I should not think so. I do not think the by-product would be of mueh value.

6093. But you would save a good deal in freight?—Yes, and, of course, it would be more acceptable to the buyers.

6094. You would get a wider market?—Yes, I believe so.

6095. **(Mr. Tatlow.)** Is yellow-wood very suitable for railway sleepers?—Yes.

6096. In the Union there must be a great demand for wood for sleepers?—Yes.

6097. To what extent can you supply the Railway Department with sleepers?—Unfortunately we cannot send many from the Knysna forest. I think we send from 75,000 to 100,000 a year of the yellow-wood sleepers. The wood is used for building too.

6098. Does the railway require to import sleepers?—Yes, a great deal.

6099. Seeing that this wood is so very useful are you doing anything to cultivate its growth for supplying the Railway Department?—It grows in the forest and it regenerates itself naturally. The forests are cut down according to the selection system in sections. A part is cut this year and that part will then be shut for thirty or forty years. The forests are worked on a rotation.

6100. Is anything being seriously done to supply the Railway Department?—We are planting pines and eucalyptus, in sleeper plantations. The Railway Department put us in funds and we plant on their behalf trees suitable for sleepers—half, say, of conifers and half of eucalyptus.

6101. How long does it take the yellow-wood to reach maturity?—It is very slow-growing. It is estimated from two hundred to two hundred and fifty years. That rather detracts from its usefulness as a plantation tree.

6102. Is there a Wattle Growers' Association?—Yes.

6103. Are they active?—Yes.

6104. They complain about the shipping freight on wattle stopping the export?—Yes.

6105. Has that been reduced?—I am not sure.

6106. It has increased from 9,000*l.* a year to 283,000*l.* a year?—Yes.

6107. You have had no complaints of freights?—I am not sure if the freight was adjusted at the time of the new agreement.

6108. You have had no complaints?—No.

6109. You mentioned plantations of eucalyptus: where are you making them?—In various parts of the country—mostly along the coast. We have some places inland too.

6110. Do you plant on the Witwatersrand at all?—There is a lot of gum plantations, but nearly all belong to the mining houses.

6111. What is the growth of the eucalyptus here compared with other countries?—Compared with Australia, I imagine they grow as fast, if not faster. They grow extremely well and freely.

6112. **(Sir Rider Haggard.)** Does your Department receeive all the hearty support of the Government?—Yes, every encouragement.

Cape Town, Thursday, 5th March 1914.

Senator the Hon. MARSHALL CAMPBELL called and examined.

(*For the evidence of this witness on "Mail Service and Freights" and on the "Sugar Industry"* see *pp.* 75 *and* 183.)

6113. **(Chairman.)** You are prepared to give some evidence about wattle?—My neighbour, Colonel Leuchars, is in a very big way in the wattle industry. I grow some wattle, but not to any great extent.

6114. Can you give us any idea of the development which you think probable in the wattle industry?—The development is unlimited provided we can get the market at home.

6115. What is it used for?—It is used for tanning leather.

6116. What is the price of it in London?—7*l.* 5*s.*

6117. That corresponds with what price in previous years?—With 13*l.* when they first started. We are now exporting wattle to Australia; I think they have to pay 8*s.* a day for labour. They have a minimum wage, whereas we have coloured labour.

6118. What countries do you compete with in this wattle business?—We compete principally with South America. One company alone in South Ameriea is turning out 140,000 tons a year from some forest there.

6119. Why do you say that the development is unlimited?—It could be unlimited if we got the English market.

6120. At what price does it pay you to grow the stuff?—It pays at the present low price of 5*l.* 16*s.* Some farmers make it pay and some do not.

6121. What is the mode of cultivation?—Personally I use steam ploughs.

6122. Is it a certain crop?—Yes, very fair.

6123. **(Mr. Campbell.)** Does South America compete in wattle or in some other tanning material?—It is some other material.

6124. They do not grow wattles there?—No.

ORANGE FREE STATE.

Bloemfontein, Friday, 20th March 1914.

Mr. ARTHUR EMMANUEL FICHARDT. President of the Bloemfontein Chamber of Commerce, called and examined.

(*For the evidence of this witness on "Fruit," see p.* 318.)

6125. **(Chairman.)** You have a large experience in connexion with trees and the danger to which they are exposed from pests?—Yes, we have practical experience, unfortunately.

6126. Will you please tell the Commission the facts?—The facts, so far as we are concerned, are as follows: My father started about sixty years ago planting trees in this part of the Colony. In those days there were practically no trees, and it was a particular hobby of his. We have a farm about four miles from town, where we have about 100,000 trees growing. The trees suffer frequently on account of drought, and we have also, in times gone by, lost very heavily through frost. The frost does not trouble us any more because we have frost-proof trees. The trouble now that we have is in regard to a certain insect called the borer, and I think we shall lose every tree on the farm unless something can be done to destroy it. It would be quite a simple matter for the Commission to go out to my place and see the trees that are affected, and, if necessary, I can have some of the insects preserved for the Commission so that they can be investigated.

6127. I do not think that we are competent to deal with them, but it would be of interest to the Commission to see the trees. What measures have been taken to protect yourself?—Up to the present nothing has been done. We have tried spraying, but that does not help a bit because the borer is underneath the bark. The only thing that we can do is to cut down the trees and destroy them and so prevent the borer from moving out.

6128. What advice has the Government given you?—Practically none up to the present. The only information they have given us is that the insect must have been introduced about four years ago and that is very little satisfaction.

6129. **(Sir Rider Haggard.)** I understand that nothing like it has ever been known in this country before?—No.

6130. Have you followed the life-history of this borer at all; have you tried to see what it develops into?—No, we presume it develops into a moth: I believe the Government have some details in regard to its development.

6131. Have they not told you?—No.

6132. It is important for you to know?—Yes.

6133. Have you sent specimens of this borer to the Imperial Institute?—No.

6134. Might I suggest it would be a good thing to send some specimens to the Imperial Institute and ask their opinion: they have the assistance of scientific people who can report on the matter?—Yes.

6135. What is the rate of increase of this borer; could you say how rapidly it spreads?—Our first impression was that the trees were dying of drought; the idea was that the roots had struck rock, because it attacked our oldest and biggest trees, but when we examined the trees we found the bark was loose, and when we removed that bark we saw traces of sawdust discharge and holes made in all directions just under the bark.

6136. Did you suddenly see a number of trees in this condition or only one tree?—A few hundreds.

6137. That shows the thing must have been at work for some time?—Yes, the Government say about four years.

6138. Is this pest peculiar to your district?—We have never seen anything like it before.

6139. Does it affect pines?—No, the pine trees alongside the gum trees on this farm are not touched.

6140. Do you notice whether there is any great increase in the spread of these insects?—As far as we are concerned we are cutting down all the trees which are infested, but we cannot say whether they are increasing rapidly.

6141. What are the trees exactly which are attacked?—Principally the gums and the mimosa, that is the ordinary wild thorn tree.

6142. Does it attack the black wattle?—We do not have the black wattle tree.

6143. Does it attack any other trees?—It attacks some of the fruit trees, the peach trees show signs of the pest.

6144. Does it not strike you that it is a matter of such importance that it should be pursued without ceasing?—We are worrying the Government about it all the time.

6145. Otherwise all your timber and fruit will be destroyed?—Yes, the Government will have to appoint officials to investigate the matter.

6146. How long ago is it since you brought it to the notice of the Government?—It is about three years ago. Exactly the same thing applies to the pests that affect fruit trees. In my annual address to the Chamber for the last three or four years I have brought the matter up seriously, and we have interviewed the Government, but we have not got satisfaction. It is a very serious matter, because up to two or three years ago this district was magnificent for fruit, but now we cannot grow anything on account of the codling moth.

6147. Which trees are attacked?—The peach is the biggest sufferer, quinces are also being absolutely ruined.

6148. Will it attack the orange tree?—No, the orange tree suffers from scale.

6149. I would suggest that you communicate with the Imperial Institute about this pest, that is the borer. As regards the codling moth that can be stopped, as you are aware, by banding?—I have killed the pests in my own garden, but my neighbours are breeding them as fast as I kill them.

6150. I understand you desire some restrictive regulations?—Yes, exactly the same as in regard to scab. Our sheep used to be rotten with scab, but the Government enforced systematic and regular dipping, and we have no scab now. I maintain that if we had a similar regulation in regard to spraying, and if it was compulsory, we would be able to do something.

6151. You are asking the Government to pass a law making the proper treatment of infected districts compulsory under a fine?—Yes, the proper spraying and washing of all fruit trees should be compulsory under a fine.

6152. **(Mr. Campbell.)** Did you tell Sir Rider Haggard that this borer is confined to your particular locality?—No, I know it is also found some miles away, near our waterworks, in the ordinary mimosa tree.

6153. Over what area would that be?—That would be 20 miles from us.

6154. Do you know whether the thing attacks all kinds of gum trees?—I think every kind of gum tree, but I think it is more liable to attack the older trees.

6155. Have you communicated with the Australian Agricultural Departments?—No.

6156. It is an Australian pest?—Yes. We have communicated with the Government, and my brother, who is in Parliament, took the matter up, and he is going on with it.

6157. Do you not think that your best means of getting knowledge about this pest would be to communicate with the Australian authorities?—Possibly it may be.

6158. **(Mr. Garnett.)** Is there no theory as to whence this pest has been introduced?—No, we have no explanation at all.

6159. There has not been any importation of eucalyptus trees for planting?—No, we have not imported for the last forty years. We have our own seed on the farm.

6160. Does this pest attack the eucalyptus all over the Cape Colony?—We have not heard of it before.

6161. You said it attacked the older trees, and your first theory was that they were suffering from drought?—Yes.

6162. Can you say whether it attacks trees that are apparently beginning to lose their vigour and resisting power, or do you think that it is the attack of the borer which causes the trees to decline?—No, I think from the experience which we have gained that the pest attacks perfectly healthy trees, and the worm is the cause of the tree dying.

6163. You think it is the attack of the pest that robs the tree of its vigor?—Yes, on the older trees the bark is much coarser, and that gives them much more opportunity of getting in. On the younger trees the bark is clean.

6164. You have not pursued your investigations to see whether the trees which have been attacked have got down to the rock and are being robbed of moisture?—No, they are not down on the rock.

6165. **(Mr. Sinclair.)** Although this pest has attacked trees at distances of some 12 to 14 miles, has it got into other parts of the Union, as far as you know?—Not as far as we know, but I am afraid it will be nearly all over the country before the Government will attack it. I am afraid they will take the matter in hand when it is too late.

6166. United action and co-operation between the different parts of the Union would be most likely to bring pressure on the Government, would it not?—Yes, I think so.

6167. No representations have been made from other parts of the Union where the evil has appeared?—I do not know, but the trouble in South Africa is that the Government usually waits until the evil is too advanced before they deal with it. So far as the codling moth is concerned it could have been prevented from coming up as far as this if proper measures had been taken in time.

6168. Can you tell us the ages of the trees that have been attacked?—They are quite forty years old.

6169. You do not think they are losing vitality?—No.

6170. Has the drought, do you think, added to the evil?—I think it is possible that the drought may have encouraged this pest, which possibly lives better in dry weather than in wet.

6171. The fact that it does not attack the younger trees seems to suggest, does it not, that the loss of vigour of the tree makes it a more ready prey to the attack of this insect?—In regard to the younger trees the bark is clean, and the beetle has no chance of finding a lodgment, but with the old trees the bark is very coarse.

6172. In the case of the younger tree, also, I presume the sap, which is pungent, is more plentiful?—Yes.

6173. As regards the codlin moth, has the prevalence of this disease been brought about by careless cultivation?—No, it is brought here in boxes of fruit. The farmer buys a box of fruit, takes it out to his farm and throws the pips and skins away, and that is how the disease is distributed.

6174. The absence of regular cultivation and regular spraying has allowed the disease to spread?—Undoubtedly.

6175. **(Mr. Tatlow.)** Have you any definite and satisfactory information as to the extent to which this pest prevails in other parts of the Union, I mean the borer?—No, we have no information; we simply took the matter up with the Government.

6176. And they have not been able to assist you?—Unfortunately, since Union our Agricultural Department, which was formerly a very big one, was moved away to Pretoria, and we only have a couple of men, and for a long period we were without anybody here. The whole of the Agricultural Department was centralised at Pretoria.

6177. Did the Government send somebody to investigate?—They sent two men out to the farm, but we have not heard with what result.

6178. Did you complain individually or as a Chamber of Commerce?—Only individually.

6179. Is it not a matter which your Chamber of Commerce should take up?—The Chamber has not gone into these matters as a general rule. Agricultural societies have done so.

6180. Have you any agricultural society here which can help in regard to the matter?—Yes, we have. It is a matter they should take up, but I do not think it has been taken up seriously yet.

6181. You are not satisfied with the way in which your complaints have been treated?—No, we feel that the only time they will take it up seriously is when it is too late.

6182. **(Sir Jan Langerman.)** With regard to the moth, you say that as fast as you destroy the pest, your neighbours breed them?—Yes.

6183. Is your place within the municipality?—It is in the town.

6184. Could you not deal with that matter by municipal regulations?—No, I do not think it would be possible. You want legislation. Take the houses round about my place, there are peach trees there which simply grew up from the pip, the things have never been planted, they are simply breeding dens for moths and flies; we spray our trees, but it does not help.

6185. Would you suggest that all these centres, at any rate, should be municipally controlled?—I would suggest to the Government, if I could, local option. Mr. Pickstone, in the Thaba Nchu district, has been planting enormous numbers of trees, for instance. Let it be local option; if the whole district wishes compulsory spraying they should be able to enforce it.

6186. Do you mean the municipal area?—No, the municipality has not taken any action.

6187. Could they not take action?—Well, the municipality does not take any action.

6188. If the municipality of Bloemfontein could eradicate this disease would it not be a splendid example to the rest of the country?—Certainly: if it were possible.

(Sir Jan Langerman.) I suggest you might do that.

6189. **(Mr. Bowring.)** Are there other plantations besides those you have referred to in this neighbourhood?—Our Town Council is going in very largely for plantations, in fact, they are planting a forest at the present time, where they intend to plant one million trees. They have a large number of trees growing already.

6190. What trees are they planting mostly?—I think prineipally eucalyptus.

6191. For what purpose are those trees grown, what are they used for when they reach maturity?—We have never been able to to anything up to the present because there has not been sufficient to make any use of them, they have simply been grown for shelter and firewood.

6192. And you find this borer in all the plantations which are of any age?—Yes, ours is the oldest plantation. I believe there have been some more of these pests found since, but we were the first to find them on our trees.

6193. And the pest is entering into other plantations as they reach a certain age?—Well, we are afraid they will.

6194. **(Chairman.)** I would suggest that you communicate with the Imperial Institute, London, S.W., in regard to this pest; they will be able no doubt to give you guidance, and I think it would also be wise to communicate with the Australian authorities, who may be able to give you valuable information. You should send specimens with full details?—Yes, I think that will be of assistance to us.

Mr. F. GRIFFITH, Municipal Forester, Bloemfontein, called and examined.

6195. **(Chairman.)** You have charge of afforestation and tree planting within the municipal area ?—Yes.

6196. How much tree planting is done ? — We have reserved a forest area which is approximately 2,000 morgen, and have several plantations around the city, probably from 60 to 150 acres, besides the parks.

6197. One of the special points on which the Commission is anxious to hear you is the devastation which has been caused or threatened by the borer ?—It appears to me that this borer has been introduced from Australia by some means and has become very serious on certain kinds of eucalyptus, particularly blue-gum and the willow-gum. The red-gum, which was one we extensively planted in this district, has not been affected yet.

6198. Since when have you noticed the borer ?—I have only recently discovered it within the last six weeks. I found trees showing signs of distress, and I sent men down to fell them, when I found the cause to be due to this insect.

6199. What is your theory as to its introduction ?—It has probably been introduced into this country in the pupal stage in blue-gum wood from Australia.

6200. Have you any idea regarding preventive measures to be adopted against it ?—So far I find the best course to take is to fell and burn the distressed trees on first signs of the borer ; when you fell the tree you destroy the grub in the larval stage. There does not seem to be any kind of bird that will destroy the beetle.

6201. **(Mr. Sinclair.)** The disease has not existed here sufficiently long for the Government to take steps to investigate its origin, has it ?—It seems that the pest has been known in this district for about three years. I have heard that it has been known on a farm three miles out and went to investigate the pest and found signs of it in a log of wood which they had used in the construction of a cowshed. This log had been felled about two years and therefore it must have been on this farm about three years ago, but we knew nothing about it. The pest has evidently come from this farm to Bloemfontein. It seems also that they have had the pest in the Government plantation at Ceres Road for some years. We have been told that it attacks older trees and that the younger trees seem to be immune.

6202. Can you furnish any suggestion for that ?—It seems that the beetle lays its eggs in a recess under the bark of the tree, and as the eggs develop they gradually work between the bark of the tree and sapwood, and on the young tree there would appear to be no substance for them to live on.

6203. There is a greater opportunity for lodgment in the older trees ?—Yes.

6204. Can you tell us anything about the area that has been reafforested in this district ?—I cannot say in the district ; it has been chiefly ornamental planting about here and a few shelter trees.

6205. Has there been any systematic tree planting for forest purposes ?—Only by the municipality.

6206. Not by the State ?—Not in the Bloemfontein District. Of course, the Government, since the Crown Colony days, has established an afforestation policy here, and they have established four stations in the Free State. Altogether, I think they have planted about a thousand morgen in the last ten years.

6207. Is the work going on ?—Yes, but very slowly.

6208. **(Sir Jan Langerman.)** Do you know anything about the codling moth in the fruit trees ?—Yes.

6209. Is it here to any large extent ?—I am afraid it has been neglected and allowed to increase. It is comparatively easy to eradicate the codling moth ; by spraying your trees when they come into bloom you can easily destroy the moth.

6210. The difficulty seems to be that there is no compulsory spraying ?—No.

6211. Do you not think the Municipality could deal with that. It is within their area and they are responsible for the welfare of that area ?—Of course we have a Government entomologist in the Agricultural Department. Whether it has been due to pressure of work I do not know, but certainly this pest has been rather neglected of late in this part of the country.

6212. If you had authority do you think the Municipality could deal with it successfully ? — Yes, I think so.

6213. Do you not think that, instead of waiting for the Government, if measures were to be taken by the municipality it would be better ?—I think it would be better.

6214. **(Sir Rider Haggard.)** You talk of this borer as a beetle ?—Yes.

6215. What sort of a beetle is it ?—It is about 1¼ inches long, and it has peculiarly shaped horns slightly longer than the body. Of course, the danger is done in the grub stage, it ring-barks the tree. You do not find any trace of the insect until the tree shows signs of distress, and then you move the bark and find hundreds of these grubs.

6216. Therefore, it is a serious thing ?—Yes, the Municipality here is spending about 3,000*l.* per annum upon afforestation work, and I have looked upon the eucalyptus as one of our coming timber trees for the Southern Hemisphere. There is one gum we have planted very extensively—the red-gum—and it supplies very valuable timber, which is worth as much as 3*s.* 9*d.* a cube in Cape Town, and is admirably suited for ordinary timber purposes, and, so far, it has been immune from this pest.

6217. Have you been on this farm ?—Yes, and I found no red-gum touched. I found blue-gums attacked within four or five yards of the red-gums, but the red-gum has so far escaped.

6218. What other trees seem to have escaped ?—The box-gum, which is another valuable gum. That is also a tree we are extensively planting. I may say that the willow-gum is extensively planted in the East, and if this pest should go in that direction it will do a tremendous amount of damage, and also in the Transvaal.

6219. How about conifers ?—I have not found it attack them. I have also found it in the iron-bark trees. The red iron-bark is a very hard gum and very valuable. I have found this insect kills trees with timber of about 12 inches in diameter at base, but the wood of the iron-bark seems to be too hard for the larvæ of this insect to penetrate. When the larvæ get to a certain stage they bore right into the heart of the tree to pupate.

6220. It attacks fruit trees also, I understand ?—No.

6221. One witness this morning said it did ?—I do not think so. Of course, we have several borers in this country. We have one which attacks the mimosa tree, but that is a different kind of beetle.

6222. Is that an indigenous borer ?—Yes.

6223. Well, he has not killed out the trees, so he cannot be very bad ?—That is so. The damage that this borer does is by cutting off the sap. The Australian beetle works probably up the stem of the tree for 2 or 3 feet. When the larvæ start to develop they make a number of channels commencing about one-sixteenth of an inch deep. The eggs are laid probably in a crevice of the bark to the extent of 20 or 30. When the eggs develop the grubs travel under the bark, eating away the sapwood, making channels from one-sixteenth of an inch to 2 inches wide, and every grub keeps apart from its neighbour ; there is a thin wall between them, and these channels go right round the tree.

6224. I understood the witness this morning to say they went into the wood ?—They go there afterwards, they bore there to pupate. That is at the final of the larval stage.

6225. They first of all go up the stem ?—Yes, until they develop into big grubs.

6226. And then they bore right in in order to lie as a chrysalis ?—Yes.

6227. So it is an extremely serious state of affairs ?—It is not the boring into the wood that destroys the

tree exactly, but it destroys the value of the timber, of course.

6228. Anyhow between the two they destroy it?—Yes.

6229. Are you taking any steps to combat this pest?—I have recommended the Council to have all such trees felled in the municipal area, and we are doing the same in the parks.

6230. That may mean the loss of all your plantations?—Yes.

6231. You say you have been spending 3,000*l.* a year on tree planting?—Yes, for the last three or four years.

6232. **(Mr. Campbell.)** I presume you have had experience elsewhere than at Bloemfontein in afforestation work?—Yes, I established the Imperani plantation for the Government. I was with the Government six years before I joined the Municipality, and have also had experience in America, and my people have been in the nursery and afforestation business for three or four generations in England.

6233. What is the reason that in this afforestation work timber trees from outside of South Africa are almost invariably used. Are there no native trees?—Along the rain belt you get the yellow-wood, but that will not stand the frost which we get on the high veldt, and besides all the indigenous trees of South Africa are very slow-growing.

6234. I have seen a very good timber which is used for different purposes in Cape Town. I think they call it stinkwood?—Yes.

6235. Is that not worth using for afforestation?—Yes, but our frosts in this part of South Africa are too severe for it.

6236. And does that apply to all localities in South Africa?—No, in its habitat it can be reafforested.

6237. Then it is only on these high altitudes where it is not suitable?—Yes.

6238. In using Australian timber, which I notice you use very largely for afforestation purposes, what kind do you generally use?—I think we must have tested a hundred different species in the Free State. The Australian trees are chiefly eucalyptus and acacias, and out of the hundred species of eucalyptus we have tested we have come down to about six, which we can safely recommend for planting in certain localities with a given soil.

6239. Do you use the Tasmanian white-gum?—No, it will not stand the frost.

6240. And the New South Wales blackbutt?—No, along the coast belts and at the Cape it will do, but not here.

6241. The red-gum will do well?—Yes, it is one of our best gums.

6242. And jarrah?—No, it will not do.

6243. You are then restricted to the least valuable kinds of trees?—Well, I maintain that we have a few which are very valuable, such as the box-gums and the red-gums, they are as valuable as any eucalyptus grown, and the red iron-bark-gum is a better quality of timber than jarrah.

6244. Does that grow here?—Yes.

6245. Is there any considerable afforestation being carried on with timber of that class in the Free State?—Nothing very great.

6246. Is anything done outside the municipality?—No, Mr. Newberry at Clocolan has the largest plantation in the Free State.

6247. **(Mr. Lorimer.)** Has it ever been observed whether any bird attacks this borer and destroys it for food?—I have not noticed, I may mention that if we had a bird of the woodpecker type, that is the sort of bird that would destroy the beetle.

6248. If you had a bird of that sort you could encourage its growth and breeding?—Yes.

6249. May I ask if you have seen or heard of any kind of insect that attacks the eggs of this pest?—I am inclined to think that the ant would be an enemy of the eggs. But I have only discovered this pest within the last six weeks. I am very keen on observing everything about it now, and if I can find an enemy or a parasite which would be useful I shall be only too pleased.

6250. **(Mr. Garnett.)** Has it ever suggested itself to you to send the larva and wood to the Imperial Institute to ask if they have any suggestions?—I have sent the insect in its three stages to the entomologist at Pretoria.

6251. But you have not sent it to the Imperial Institute in London?—No, but I can do so.

6252. **(Chairman.)** I think it would be desirable to do that, and possibly also to write to the Australian authorities?—Of course, the Entomological Department here is now studying the life-history of the pest, and I suppose they will go thoroughly into the matter, and inform us of the result of their investigations and what they suggest as to a remedy.

Note by Witness.

The following are the entomological names of borer beetles mentioned:—

Phoracantha recurva	The eucalyptus borer beetle.
Macrotoma palmata	The mimosa borer beetle.

For information the following are the botanical names of the species of gums afore-mentioned, viz.:—

Botanical Name.	Vernacular Name.
Eucalyptus globulus	Blue-gum tree.
„ *viminalis*	Willow-gum tree.
„ *rostrata*	Red-gum tree.
„ *tereticornis*	Forest red-gum tree.
„ *sideroxylon*	Red iron-bark-gum tree.
„ *leucoxylon*	Ordinary iron-bark-gum tree.
„ *polyanthema*	Red box-gum tree.
„ *melliodora*	Yellow box-gum tree.
„ *hemiphloia*	Grey box-gum tree.
„ *redunca*	White-gum tree.
„ *pauciflora*	Also a white bark-gum tree, good frost-resister, and thrives in the more humid parts of the high veld.
„ *marginata*	Jarrah.
„ *pilularis*	The blackbutt-gum tree.

Bloemfontein, Saturday, 21st March 1914.

Mr. C. McG. JOHNSTON, Secretary to the South African Agricultural Union, called and examined.

(*For the evidence of this witness on "Animal and Agricultural Produce,"* see *p.* 215.)

The witness made the following statement:—

I notice that it was said yesterday that the gum-tree borer is not known elsewhere than in this Province; that was the impression I got from the Press report. But I would like to point out that it is known in certain parts of the Cape Colony, and it is also a pest in Australia. I discussed the matter recently with the Assistant Chief Entomologist, Mr. Claude Fuller. He comes from Australia, and he assures me the insect is quite prevalent in certain parts of the Cape.

6253. **(Sir R. Haggard.)** Are you sure that this borer is prevalent in the Cape. I visited those two beautiful plantations at the top of Sir Lowry Pass and saw no trace of it?—Mr. Claude Fuller, the Assistant Entomologist in Pretoria, was here the other day in connection with it, and I suggested this was the only place where it existed, but he said there were several forests in the Cape Colony also affected.

NATAL.

Durban, Wednesday, 25th March 1914.

Mr. C. D. KEITH FRASER, wattle-grower, called and examined.

6254. **(Sir Alfred Bateman.)** You have sent in a memorandum which has been circulated and carefully read by the members of the Commission, so it is not necessary, I think, to read it now, but I will ask Mr. Lorimer, who knows a good deal about the subject, to ask you a few questions, and my other colleagues will do the same?—Yes.

The memorandum submitted was as follows:—

WOOD DISTILLATION.

A big new industry can be established in Natal in the distillation of wood, if the British War Office could be induced to use acetone, manufactured from Natal wood, in preference to that produced from Bosnian beech, which is the chief source of supply at the present time.

The Bosnian product arrives in England in the form of acetate of lime, and is there distilled into acetone of a 78 per cent. standard of purity. The purity standard of acetone from Natal wattle wood is 80 per cent. The price would be the same as the lower standard article.

Several attempts have been made to obtain a contract, or at least some guarantee of support, from the War Office, but so far without success, chiefly, I believe, because the matter of the supply of this article—an essential in the manufacture of cordite—has become one of stereotyped routine.

The Chemical Union and/or Brunner, Mond & Co. have supplied the War Office requirements of this class for many years past, and the new orders go to them now as a mere detail of routine. Sir Matthew Nathan, when Governor of Natal, became interested in the matter, and brought it to the notice of his brother, Colonel Nathan, R.E., at that time, I believe, in charge of Woolwich Arsenal; but nothing came of it, and subsequent representations have shared the same fate.

Without either a definite contract or some assurance of support, even to a limited extent, it will be obvious that the growers of wattle in Natal, comprising, as they do, a large number of comparatively small farmers, would find it impossible to compete against wealthy corporations like the Chemical Union and Brunner, Mond & Co. in any venture where their interests clashed, or in finding a market at all in open competition.

The fact that acetone—an essential of cordite—was being imported entirely from foreign countries was shown to be a national danger in a leading article in the "London Times" in July 1907, and it is this aspect of the matter that has been emphasised as an inducement to the War Office to support its manufacture in a British possession.

Acetone, as already stated, is made in England from acetate of lime, in which form the product leaves the various centres of primary distillation. The British import of acetate of lime from America alone averages 40,000 tons per annum, valued at about 500,000*l.* I do not know what the import from the Continent of Europe amounts to, but I believe the celluloid industry uses about as much as the explosive industry, and the total import value probably exceeds 1,000,000*l.* per annum. Wood distillation at the present time is confined to the vicinity of large indigenous forests, and in consequence factories have either to be removed to new sites as the wood area around them becomes exhausted, or transport methods have to be extended at an increasing cost per ton mile of haulage.

In Natal the position in this respect is unique in the whole world, as the timber is reproduced on the original plantation sites every seven or eight years.

A factory established here would, therefore, have a regular annual rotational acreage of trees to reap for an indefinite number of years, and transport and other costs would not vary, except to a very limited extent with the rise or fall in the cost of unskilled labour.

There are seven centres in Natal which could support distillation factories, five of them treating 30,000 tons and two 20,000 tons, a total of 190,000 tons of wood per annum.

The acreage of trees served by those factories within easy distance of the railway would be 105,000 acres, that is, less than half the acreage under wattle in the Province as a whole.

The most economical method of dealing with this available wood would be to have carbonising plants at the seven centres above indicated, and one central refinery to treat the district products as a whole.

A factory dealing with 30,000 tons of wood per annum would cost 25,000*l.* in working order.

Its products and their value would be:—

	£
1,650 tons acetate of lime at 12*l.* per ton	19,800
420 tons, 93,900 gallons crude wood spirit at 2*s.* 3*d.* per gallon	11,737
960 tons wood tar at 30*s.* per ton	1,440
7,500 tons charcoal (sold as firewood) at 15*s.* per ton	5,625
	38,602

Expenditure would be:—	£	
30,000 tons wood at 6*s.*	9,000	
550 tons lime at 40*s.*	1,100	
Freight 1,650 tons acetate at 20*s.*	1,650	
Working expenses, 30,000 tons at 14*s.*	21,000	
Leaving for depreciation and profit	5,850	
	38,600	38,600

or say 20 per cent.

If the same factory were equipped to continue the refining process to acetone, the results would be:—

Erected Cost in Working Order 35,000*l.*

	£
330 tons acetone 80 per cent., at 80*l.* per ton	26,400
420 ,, crude spirit at 2*s.* 3*d.* per gallon	11,737
960 ,, wood tar at 30*s.* per ton	1,440
7,500 ,, charcoal at 15*s.* per ton	5,625
	45,202

Costs would be—

	£	
Working expenses, 30,000 tons at 15*s.*	22,500	
30,000 tons wood at 6*s.*	9,000	
Freight 330 tons acetone at 5*l.*	1,650	
Leaving for depreciation and profit	13,052	
	45,202	45,202

or say 35 per cent.

The profit shown in the foregoing assumes the sale of the entire production of the factory, and although I have no doubt as to the sale of the products of one factory of this size—with the possible exception of part of the crude spirit output—I am unable from personal knowledge to show how it would be possible to dispose of ths crude or refined spirit output of the seven factories there is wood enough to serve. Neither have I any personal knowledge of the oversea market for wood spirit, nor any idea as to whether it would be possible, in its refined form, to adapt it for power purposes to internal combustion engines, and thus secure a South African market for it.

At the present time there would be no hope, so far as my knowledge goes, of finding a market for all the bye-products of the seven factories the Province could support. The local consumption of crude wood spirit is about 10,000 gallons only. What it is in rectified spirit I have been unable to ascertain, as the Statistical Bureau in Cape Town lumps everything of this nature under one heading as chemicals. Other bye-products of which I have been unable for the same reason to obtain statistics of consumption, are glacial acetic acid, acetate of lead, acetate of soda, creosote, and refined naphtha.

The market for firewood could, I am certain, be secured for charcoal, as that could be supplied to the consumer at less than the cost of firewood, and the tar output would also find a ready sale for many years, for street and road improvement purposes.

In recommending district carbonising plants and one central refinery, my object was to minimise supervisional costs. The district plants would not require the highly trained technical staff that the central refinery would, as in the former case the product would be acetate of lime, which is a harmless solid, whereas the refinery staff would have to deal with acetone—a volatile and highly inflammable liquid requiring specialised knowledge in its production and handling.

In summing up the whole matter, my point is that the timber easily available for use, which is now going to waste, or of which only a very small proportion is utilised for mine props and firewood, represents a realisable value of 180,000*l.* per annum, thus:—

		£
2,000 tons	acetone - - - - -	160,000
2,290 „	wood spirit, say quarter saleable, at 2*s.* 3*d.* per gallon	15,400
5,440 „	wood tar ditto, 30*s.* per ton	2,040
42,500 „	charcoal ditto, say 10*s.* -	5,312
		182,152

say 180,000*l.*, and three quarters of the bracketted by-products to waste.

Appendix attached to this report shows the products of wattle wood in a very clear manner.

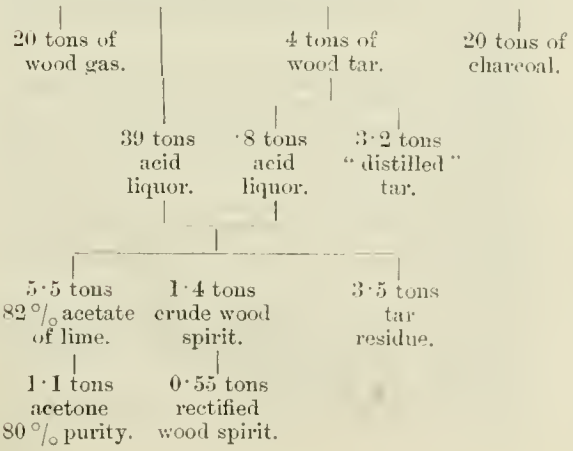
The experiments determining these quantities were carried out at the Chemical Engineering Works, Hendon, by Dr. Lessing, a chemist of wide repute, and were completed on 20th August 1912.

In bringing this matter to the notice of the Dominions Royal Commission, I do so in the hope that attention may be directed to a means of helping a struggling industry represented by a class of men who have so far fought their way without Governmental assistance in any shape or form, but who are now in a precarious position owing to the fall in the price of wattle bark, and who are unable for reasons which this report will have made obvious to make any material use of their wood.

Appendix.

Products obtainable from Wattle Wood.

100 *tons of Wattle Wood.*



20 tons of wood gas.
4 tons of wood tar.
20 tons of charcoal.
39 tons acid liquor.
·8 tons acid liquor.
3·2 tons "distilled" tar.
5·5 tons 82 % acetate of lime.
1·4 tons crude wood spirit.
3·5 tons tar residue.
1·1 tons acetone 80 % purity.
0·55 tons rectified wood spirit.

6255. **(Mr. Lorimer.)** What is this timber that you propose to use for distillation?—It is wattle wood.

6256. You have enormous quantities of it, have you not?—Yes.

6257. Is it not all used for producing bark for tanning?—None of it is used for tanning.

6258. You cannot utilise for tanning purposes all you grow, can you?—Only the bark of the tree is used for tanning.

6259. Does not the removal of the bark destroy the tree? Does it grow again?—Yes, it grows from seed self sown.

6260. There is no doubt at all that the distillation of this timber is a very interesting and valuable proposal. We had the same thing suggested to us in New Zealand when we were there, and the gentleman who spoke on the subject complained that the whole of the bush that was cleared for settlement was used in the most wasteful manner, and simply thrown away without being utilised in any way whatsoever. He also pointed out that the acetone which could be obtained from this timber was worth at least 75*l.* a ton?—Yes.

6261. You say you have attempted to induce the War Office to listen to your proposals and without effect?—Yes.

6262. Through whom did you make the representations?—My report states how the representations were made. They were made by Colonel Nathan on the representation of his brother, who was then Governor of this Colony.

6263. But was any attempt made to present the matter through the agency of the late Sir Richard Solomon?—Not to my personal knowledge.

6264. Because, of course, a matter of this sort presented to the War Office in that way would carry greater weight from the official head of the Union than through any individual person?—When that representation was made it was three years before Union.

6265. The matter seems to me to be of so much importance that you ought to have made representations to the War Office through the Government agency. I do not think it is much use for any individual to go there, because he would simply be made the vehicle of red tape, but if a representation as to the facts and the possibilities of the supply of so essential an article as this, within the Empire, were presented authoritatively and officially it would not be easy to overlook it, and it would not be easy to set it aside. Have you practically an unlimited quantity of this wattle?—The area of wattle I have shown in my report is readily available for transport and near to the railway, but there is about three times that area altogether in the Province.

6266. Of course, if this became an established industry there would be no difficulty in providing sufficient railway accommodation for your purpose. Has this wood been tested sufficiently to warrant you in saying that this would be its production?—Yes.

6267. On a large scale?—Yes.

6268. Where?—At Hendon, in England.

6269. How much of it was put through the experiment?—About 25 tons.

6270. Was the production in accordance with what you say in your paper?—I am going to submit the official report.*

6271. Were there any of the War Office people present at that experiment, do you know?—I cannot say.

6272. By whom were they made?—By Dr. Lessing.

6273. On behalf of whom?—On my behalf, at the request of people to whom I had submitted it in England.

6274. When you got that report what did you do with it?—I left the matter in the hands of those people at home, friends of mine.

6275. And have they presented the report to the War Office, do you know?—I understand so. I understand that one of the officials at the War Office was interested in the scheme and reported it to the proper

* Not reproduced.

quarter. That is the only information I have received. I am not saying that from personal knowledge.

6276. Has anything come of it?—No.

6277. Has it been the influence of the Chemical Union which has prevented your wood being utilised so far?—I am given to understand that is so. It is on account of the vested interests that are employed.

6278. Then you are not getting justice on account of vested interests, or you are not getting a fair opportunity of submitting what you can do?—That is what I am given to understand.

6279. What you put forward is this—that you have enormous quantities of this timber available, and the British War Office could be adequately supplied with all the acetone they want?—I do not know what is the total quantity the British War Office require, but we could supply them possibly with about 6,000 tons and with a readily available quantity of 2,000 tons each year.

6280. And do you submit also that experiments have been made which have placed it absolutely beyond doubt that this timber provides acetone which is worth the market price?—Beyond dispute and beyond any question of further proof.

6281. And you further state that, as far as you know, the requirements of the War Office are at present being supplied from foreign countries?—Yes, it is supplied from foreign countries.

6282. And you can produce, if not all the Empire requires, at any rate a certain substantial amount?—Without any question.

6283. I do not know whether the suggestion which I have made to you would be immediately available until Sir Richard Solomon's successor is appointed, but I think the proper way to approach the War Office would be through him?—I understand that this matter was taken a very great interest in by the late Minister for Commerce in the Union Government. He took a very keen interest in it indeed, and made many inquiries on his own behalf and at his own expense, and he was most sympathetic. He represented the matter, I understand, to the Union Government, and I believe that a representation was made to the British War Office by this Government, but nothing came of it.

6284. Well, now, have you anything else that your timber would produce if it were distilled?—I give the list of by-products in this paper with the percentages.

6285. **(Mr. Garnett.)** Have any efforts been made to put the potentialities and possibilities of this Province before either Messrs. Brunner, Mond, and Company or the Chemical Union?—I am in this difficulty. I have not been able to go home and bring this matter before the people concerned except through correspondence and agents. The replies I have received have been that it is quite impossible to get beyond the people who are interested. We could not get to the War Office direct.

6286. I am asking this—if you are producing acetone with a purity standard of 80 per cent. against a Bosnian product of 78 per cent., have the users of that Bosnian product had the potentialities of your Province put before them as a source from whence they could obtain their supplies?—I cannot say from personal knowledge, but people who have had the matter in hand for me at home have always given me to understand that the vested interest of the suppliers of acetone at the present time were such that we would be beaten out of the market if any attempt was made to get the industry started here. Whether any attempt was made to get the interested people to start the industry themselves in this country or not I cannot say. As far as I was personally concerned it was quite immaterial whether it was the War Office or Brunner, Mond, and Company, or the Chemical Union or anyone else.

6287. All I want to know is whether the advantage of drawing their supplies of acetone from your Province has been put before either Messrs. Brunner, Mond, and Company or the Chemical Union?—Not to my knowledge.

6288. Because it would seem to me that, if the cost of production is not very much greater or even slightly greater than under the present system, the advantages which you could guarantee in regard to the superior quality of your product would no doubt induce people with capital to develop this industry in this country, in the same way as I understand certain industries have already been established by English capitalists in South Africa?—Yes. I must confess that when I first took this matter up, some seven years ago, it was with the object of getting the material made in Natal, and securing contracts so as to obtain the benefit of the manufacture here, but after the wattle-growing business spread so much in this Province, and the waste wood became a matter of such great monetary value, I gave up any idea of that, and I would have been only too anxious for anyone else to take it up. But the people who represented me on the other side said it was impossible, because there were so many vested interests involved in connection with the present sources of supply.

6289. **(Mr. Sinclair.)** Is there no hope of local capital starting a factory in order to produce actual results without waiting for outside people to begin the undertaking?—There is no hope whatever without some guarantee of the market. I understand that the source of supplies at present is a trust or combine at home, and it would be impossible to compete with them unless we could get a firm undertaking from the War Office to use the acetone which we could produce.

6290. The thought passing through my mind is this—You cannot avoid competition. You would have to face that, would you not. After you have your factory erected and in working operation you must face competition?—You would have to face competition, but I think that you would be justified in getting some sort of preference for the acetone produced here from the War Office.

6291. That may or may not be so, but is there not sufficient confidence in your power to face competition successfully to induce local capital to take the industry up without an outside undertaking that you will get some preference or benefit for your product?—I think that is quite certain. It is an absolutely new idea here, and like all new things, especially with the class of men engaged in it, the local capitalist would be very chary of putting up money to start a factory without some sort of a guarantee that there would be fair competition or an assured market for the valuable part of the product.

6292. The market, on the other hand, would like to see actual results before it committed itself to take the article, would it not?—I submit that the results have actually been obtained.

6293. In what shape?—By actual experiments on a large scale.

6294. You are referring to the 25 tons that were treated at Hendon?—Yes.

6295. **(Mr. Bowring.)** Is the wattle timber indigenous to South Africa or has it been brought from outside?—It has been brought from outside.

6296. From where?—From Australia.

6297. And it grows in this country as well as in Australia?—I have been told better.

6298. But I suppose there are quantities of it in Australia the same as here?—No, there is not so very much, at least six years ago there was not very much; there is a good deal of indigenous wattle—very little cultivated.

6299. It has been running in my mind that possibly Australians might also be looking for similar privileges if what you advocate was done?—I think it very likely with regard to the cultivated area, but the cultivated area six years ago in the whole of Australia was only about 15,000 acres.

6300. Are there no other uses for acetone besides making explosives?—It is also used in the celluloid industry and in all industries that require a solvent for fat or resin.

6301. There is a large field for exploitation?—Yes, and what is used in the celluloid industry and for other solvent purposes is of very much less purity and it is not so expensive to produce.

6302. For explosives you want a higher standard?—Yes.

6305. You contend that it could be made here better than elsewhere?—It could be made as well, at any rate.

6304. **(Sir Alfred Bateman.)** In regard to this company you refer to, the Chemical Union, is that the name of it, or are you referring to the United Alkali Company?—I cannot say. I understand it is a union between firms in the United States and firms in Great Britain. I think its headquarters are in the United States.

6305. The word bark has been used several times in this discussion, surely you are referring to the wood?—Yes, the wood only.

6306. You are not referring to the bark?—No.

6307. As Mr. Lorimer has already suggested, your best plan would be to get into touch with the War Office through the High Commissioner and get the War Office to make these tests. Your own were private tests, were they not; there was no representative of the War Office there?—No official representative, as far as I know.

6308. But surely it is very desirable to get the War Office to be present at these tests?—I know there was a representative of the War Office, but whether he was there officially or not, I cannot say.

6309. **(Mr. Lorimer.)** I have been looking at these figures since we were speaking. If you established these seven factories locally would they be on land belonging to the Government or private individuals?—Entirely belonging to private individuals.

6310. And the central factory would also probably be established on ground belonging to private individuals, the refining factory?—Yes.

6311. Of course it would not be impossible, but would not that present certain difficulties in regard to coming to terms and settling the question of rights and all the rest of it. When I speak of the factories, I do not mean the central factory, but the individual factories which are erected on land belonging to private individuals. I mean the whole of the timber there belongs to them?—It would be a number of individuals, there are no single individuals with enough to supply even one factory, or any two individuals.

6312. It would probably be best, I should imagine, for a central power to arrange to purchase the trees from each individual grower, would it not; there would be disputes as to quality, value, and so on unless the whole thing were brought into a common centre?—No, there is no question of quality, the only criterion would be the age of the tree.

6313. The age of the tree would determine the price, and each tree of a certain age would be worth the same price? Yes, but you would reckon them in hundreds of acres, of course, instead of in trees.

6314. But can you safely say that each individual tree of the same age on these plantations would be of the same value for the purposes of the central factory?—The figures which I have given are the average tonnage per acre.

6315. So it would average that?—Yes.

Pietermaritzburg, Friday, 27th March 1914.

Mr. FREDERICK THRELKELD ANGUS, Senior, Vice-President of the Co-operative Agricultural Union, and Mr. W. N. ANGUS, Junior, called and examined.

6316. **(Sir Alfred Bateman to Mr. F. T. Angus.)** You are Vice-President of the Co-operative Agricultural Union?—Yes, but I have not come in that capacity. I have come to give evidence on the wattle industry.

6317. What have you to say on that subject?—I may mention that, as perhaps you are aware, the bark of the *Acacia mollissima* was exported from Australia many years before Natal commenced to export. I think in 1880 or 1881 the late Sir George Sutton called attention to the value of the bark as an article for export, and about 1875 I had planted some acres of this tree in Umvoti county in Natal. In 1887 I made the first shipment, that is to say, the first shipment of anything more than a mere sample, and from 1887 to the present time I have been exporting. I think I was the first to ship wattle bark from this country. The price has ranged from 7*l.* to 17*l.* 10*s.* in that time, but for the past fifteen years I suppose about 9*l.* has been the average price, that is 9*l.* London and Hamburg. There has not been any accurate estimate of the acreage, no actual survey at any rate, but it is generally thought that about 200,000 acres are at present under wattle in Natal alone.

6318. Is there much in the other Provinces?—I do not think there is much. There is some in the Transvaal. I think the Free State is too cold. There are some in the neighbourhood of Johannesburg, but they have not planted largely, I think. It is mostly in Natal. I may also mention that in the early stages of the industry we were quite free from insect plagues, the price was very high and labour very cheap. At the present time we have many plagues, a low price for bark, and labour becoming scarce. White labour is out of the question. Australia formerly exported about 30,000 tons annually to Europe; now, not only have they ceased to export but we are sending bark to them from here.

6319. Is that for curing their own leather?—Yes, for tanning; the chief market, however, is Hamburg, and the brokers there appear to have combined and managed to control the price; it is, therefore, most desirable to find as many markets as possible, and we are making efforts in that direction now. I do not know whether it is any use mentioning to this Commission that we are under certain disabilities with respect to our railway. That is to say, we are sending from a siding and taking the entire risk of our consignment until it gets to the port, and we are provided with very inferior tarpaulins to cover the stuff, and the consequence is that the bark gets damaged frequently and we have no redress.

6320. You have complained about that to the Railway Department I suppose?—Yes, and representations are being made through the Union again, I think. In conclusion, I may say that the assurance of a good labour supply is most essential. At the present time, the output is limited by the amount of labour available. We could do very much more if we had plenty of labour.

6321. You mean that you could put a bigger acreage under trees?—Yes, if the labour supplies were adequate. With a good labour supply, reasonable care by the Railway Department, and that sort of thing, the prospects for the industry are, I think, very good indeed, as tanning materials throughout the world seem to be consumed at a greater rate than they are produced.

6322. I suppose this originated when oak tanning was getting dearer?—Yes, well there are many tanning materials and they have constantly been coming in. I believe that this particular bark grows better here than in Australia. In Australia they have another bark which is used very largely, and is of a better quality than the bark we grow, but it does not crop so heavily. That is the *Acacia pycnantha* or golden wattle. Its trade name is "best Adelaide."

6323. **(Mr. Campbell.)** It comes from West Australia principally, I think, from Fremantle?—Yes, but it does not do well here, and it does not pay. I think that is all I have to say.

6324. **(Sir Alfred Bateman.)** Where do you get your labour from?—The labour so far is the indentured Indian and some native labour, but the Indian labour has been stopped.

6325. I suppose you have superintendence by whites?—Yes, and Indian sirdars instructed by the white employer.

6326. **(Mr. Sinclair.)** You told us that you have about 200,000 acres of these wattle trees in Natal. Has that all been artificially planted or has it extended from self-sown seed?—Practically the whole of it is artificial. You get a little overlapping the boundaries, but it is insignificant.

6327. What is the effect of wattle-growing on the soil?—It improves the soil. I think the root has the nodule containing the bacteria which collect the nitrogen from the atmosphere and improves the soil in the same way as peas and beans.

6328. As to the pests from which the tree suffers, are you getting control of them?—Not in the least.

6329. Are they making headway against you?—Well, they have their natural enemies, and they go in cycles. The bag worm, which is one of the most destructive, has very numerous enemies, which almost kill it out until they themselves die of hunger. Then the bag worm increases again enormously until its enemies again become strong enough to knock it out. There is no other way of checking them.

6330. Australia's output of bark was materially lessened, was it not, by the insect pests that got into the trees?—I cannot say.

6331. Have you any fear of the pests making such headway that they will ultimately destroy the trees?—No, fortunately the trees have great vitality. For example, last season we had plantations entirely defoliated by these bag worms, and they are quite recovered again this season.

6332. What do you say the price of wattle bark is to-day per ton?—About 7*l.* 2*s.* 6*d.* London.

6333. Is that reduced price the result of combination at Hamburg?—We believe so, but we cannot prove it. We are convinced that it is so because other tanning materials have not fallen at the same rate.

6334. You do not speak as to the use of the wood of the tree?—We market the wood as fuel and as mine props.

6335. **(Mr. Bowring.)** At what age do you commence taking the bark from the tree?—It varies according to the season. If we have very favourable seasons we may commence thinning it over at 4½, five, or six years, according to favourable or unfavourable seasons, and the immunity otherwise of these plagues. But five years is the most likely.

6336. And when you strip the bark you destroy the tree?—Yes.

6337. It does not grow from the roots again?—It is not desirable. Some of them will ratoon and some will not, but if you allow them to grow up again from the old stem they are very weak and are easily knocked over by the wind.

6338. Therefore you replant?—No, they replant themselves. They come up very thick like a crop of corn, and it costs a lot to thin them out. Really it costs more to thin them than the original planting.

6339. I suppose the small trees that you thin out are valueless?—Yes, except for any fertilizing qualities they may possess.

6340. What size of tree is it that you take the bulk of the bark from?—The first thinning will average about 2 or 3 inches in diameter, and the final thinning would run from 5 to 9, 10, or even 12 inches in diameter.

6341. I suppose that is the extreme limit?—Yes, that is about the extreme limit.

6342. **(Mr. Tatlow.)** Is the industry profitable at the present time?—Yes, that is for plantations close to the railway. I think plantations very distant from the railway would hardly pay.

6343. Are there plenty of plantations at present within easy reach of the railway?—Yes, a good many, and a great many at very considerable distances. I should think many of them are at non-payable distances.

6344. Is there plenty of suitable ground within access of the railway which can be devoted to it?—Yes, I suppose there is a good deal of land near the railway.

6345. Will you tell me in what way the bark suffers damage during transit by rail?—It suffers damage by wet. Tannic acid is easily driven out by rain.

6346. Is it conveyed in open trucks?—In trucks covered by tarpaulins, and it is owing to the faultiness of these tarpaulins that the damage occurs.

6347. Does not the railway provide covered trucks?—No, all the trucks we have for bark are open and covered with sails or tarpaulins.

6348. How is the bark packed?—It is packed in bags, about 200 lbs. in a bag.

6349. Does the Department decline to convey it in covered trucks?—Well, they have never offered covered trucks.

6350. Are they ever pressed for?—No, I do not think so. I think until Union took place our tarpaulins were excellent. Since Union, however, all the trucks have been sent to the Cape and they have sent all the rubbish to Natal. That is my opinion.

6351. If this was put before the Department surely they would remedy it, because it is to the interest of the country that this bark should be properly conveyed?—Yes, it should, there is no doubt about that, but they are very slow.

6352. Do you press the matter sufficiently?—Well, we do our best.

6353. I suppose in regard to the rates these are favourable, are they not? Is this bark chiefly exported?—All of it.

6354. You have favourable export rates?—The rates are very reasonable.

6355. What distance is this bark conveyed, I mean what average distance?—Well, mine are conveyed about 140 miles perhaps, and they will go as far as 300 miles I should think.

6356. For 140 miles what would be the rate per ton?—About 8*s.*

6357. That seems a reasonable rate?—Yes, it is reasonable.

6358. What is a full truck-load?—It is a 20-ton truck.

6359. Is it conveyed at the owners' risk? Does the Railway Department take any responsibility as to risk of damage in transit? When it is loaded at a siding they do not. When it is loaded at a station, it is at the risk of the railway, and it is loaded by the railway. At the siding we have to load it ourselves and take the risk, even when the Department admits that the damage was due to them.

6360. Is that not a condition of the low rate which you get, that the owner takes the risk?—No, that is not so, because at the station the railway does take the risk.

6361. When it is at the station is it an equally favourable rate?—It is exactly the same rate.

6362. It seems strange that because it is loaded at the siding you should have to take the risk, whereas if it is loaded at the station the Department takes the risk, although the rate is the same. The Department accepts the risk in one case and not in the other. There must be some reason for this?—There is no reason. It is an absurdity, more particularly as they are doing the work themselves. We load the stuff ourselves at the siding and the Railway Department has no trouble.

6363. Perhaps they contend that they load it properly and that the risk is not, therefore, so great?—Well, you see they have not pleaded that; if they had claimed that, there would have been some reason, but the reports we have had so far have been that so many bags of bark have been damaged by wet owing to the rain having soaked through the tarpaulin, and we can get no satisfaction.

6364. **(Sir Rider Haggard.)** How does this wattle-growing at the present prices pay in comparison with other crops?—I should imagine that close to rail at present it would pay better than mealies.

6365. And better than lucerne?—There is nothing pays like lucerne.

6366. And better than cattle?—Better than ordinary cattle. Possibly dairying with high class cows could go better.

6367. At present prices, then, it has no startling advantages over other products in the way of payability?—Certainly not.

6368. Do you anticipate that those prices will go up or down?—I think they are certain to go up.

6369. Why?—Because, as I mentioned before, tanning materials and timber generally are being consumed at a very much greater rate than they are being produced.

6370. Is there a system of synthetic tanning produced yet?—There is chrome tanning, but that has been going on for many years without knocking the bark tanning out.

6371. You are aware, I suppose, that our oak bark at home now scarcely pays for removal?—That is quite likely. It contains about 6 or 8 per cent. of tannin as against our 35 per cent.

6372. Then, perhaps, it is wattle which has done for us in that respect?—Very likely, I think.

6373. You look forward hopefully to the wattle industry?—Well, I think it is quite as hopeful now as when it commenced.

6374. Is there much being planted?—No. There has been a distinct check in planting owing to the fall in price, especially at places distant from rail.

6375. What does it cost per acre to stock a wattle plantation?—That is to say, to get it cut?

6376. The ploughing, sowing, and labour.—I should think about *1l.*, but it will vary according to the class of land. But *1l.* an acre would plough and sow it.

6377. And fence it? You have to fence it, I suppose?—Of course, ploughing varies in cost, but under the most favourable conditions that would include fencing, I think.

6378. So that the prime cost is not a matter of great moment—it is so low?—The prime cost is not great, but there is constant work while it is going on to keep it clean and fireproof.

6379. Does it require cleaning? Does not the dense shade kill the weeds?—It will keep the weeds down, but in the meantime they are troublesome—in the early stage.

6380. They have to be hand-hoed, I suppose?—Of late years a change has taken place. We used to plant 6 feet by 6 feet each way, but now we find it better to plant 12 feet by 6 feet.

6381. You sow the seed and then thin them out?—As a rule the seed is sown on the spot. At each space, a pinch of about 20 seeds are planted, and afterwards, all the bad trees are taken out and the best ones left; or they are planted continuously like peas and beans, and then they are thinned out to the proper distances. We have to sow thickly owing to the depredations of insects, and so on.

6382. Do these plagues ever destroy plantations?—No, I have never seen plantations destroyed.

6383. It is a very hardy thing, I should think?—Yes. Even if it takes fire—if it is not too severe—it will recover.

6384. Why is Natal peculiarly suitable for the wattle—more than other parts?—I suppose the climatic conditions are favourable, I am told that it does very much better here even than in its native country—it grows quicker and larger.

6385. You are not going to tell us anything about the general agricultural situation here?—No.

6386. **(Mr. Campbell.)** Has the municipality of Maritzburg been planting wattles heavily?—Yes.

6387. What is their intention—to go into the wattle-growing business?—I suppose it is for income for the town.

6388. Do they intend to strip the bark themselves or let the bark stripping to private individuals?—They have a manager who has a staff of labourers, and he will conduct the plantations just as for a company.

6389. What is the area they have planted?—About 5,000 acres, I think; I am not sure.

6390. Do they intend to extend the business?—No, I think this is all the land they have available.

6391. **(Mr. Garnett.)** You spoke just now of trees growing up to 5, 9, and 12 inches. How long does it take for them to attain that growth?—For a tree to attain 12 inches would take about ten or twelve years under favourable conditions.

6392. At the spaces that you have worked out the trees, how many does it work out to per acre?—6 × 6 works out at about 1,200, and 12 × 6 at, I suppose, 500 or 600.

6393. And it costs you *1l.* to prepare the land, fence it, and so on?—It will vary, but I think that should be about the figure.

6394. Your principal exports are to Australia and to Hamburg you say?—By far the greater amount goes to Hamburg, and next to that England and the Australian market, but they have only commenced quite recently.

6395. Does much go to England in the form of bark?—I suppose 5,000 tons, perhaps.

6396. I think we had it mentioned in evidence somewhere that England does not like the bark—they prefer the extract?—Yes, there is only a small market for the bark—about 5,000 tons, they use the extract principally in England.

6397. Where is that extract made?—All over the world—not of wattle bark necessarily. There is one firm of wattle extract makers in England—and the only one I know of—the Calder and Mersey Company—and they extract wattle bark to use as a blend with other tanning materials.

6398. You do not know whether any of this considerable export to Hamburg in the form of bark eventually finds its way into England in the form of extract?—It is quite likely.

6399. You have no definite information?—No, but there is an immense market for the bark in Germany and Russia. The small tanners who have been accustomed to use bark instead of extract are very conservative and keep on using it.

6400. Have you any difficulty in disposing of your bark?—No.

6401. If you had more you could dispose of more?—Yes.

6402. You say your output is very considerably limited by the limitations of your labour supply?—Yes; I think so.

6403. And you gave us to understand that if you had a plentiful labour supply here, the industry would be much more prosperous?—We are all hampered for want of sufficient labour.

6404. I was going to ask you whether there would come increased prosperity from two causes—one, the greater quantity you would have to sell, and also from the fact—I suppose you must have fixed charges like everyone else—that the more of your product you can sell the less is the cost, as measured by those fixed charges?—Yes, it lowers cost of production, and the more we can produce the more chance we have of extending our markets. For example, there is the United States, they will not look at it because we cannot assure them of a sufficient supply. They want enormous quantities.

6405. Well, then, in that cases it seems to me you have a very large potential market which you have hardly touched?—Yes.

6406. Your further prosperity depends very largely on your being able to attract sufficient labour supply to your industry?—Yes, that is the difficulty.

6407. At any rate, you have no fear whatever of being able to dispose of a very much greater quantity?—I do not think there is the least likelihood. The proportion that wattle bark bears to other tanning materials is about 2½ per cent.

6408. And, in spite of the comparatively low price to-day, you are still of opinion that, compared with other crops mentioned, wattle is the more attractive?—Yes.

6409. **(Sir Alfred Bateman.)** Do you know anything about the movement to establish factories here to make the extract of bark and send it home in that form?—A meeting is to be held in a day or two with that object in view. I think it is to form a company to extract the tanning material on the spot.

6410. You do not know whether there is much strength behind that movement?—I think it is likely that the growers will support it.

6411. And you would be glad to see it?—Yes, I think it would have the effect of relieving the German market and sending the price up.

6412. It would give you another market?—Yes.

6413. Also in connection with other products, do you know anything about using the wood for making acetone, used in the manufacture of cordite?—No, but I think my son here has had experience of by-products, and could speak on that point.

6414. **(Sir Alfred Bateman to Mr. W. N. Angus.)** Do you know anything as to this proposal for distilling the wood?—The question has been mooted for some time, but it has never got so far yet as to put down a plant of any size. Many experiments have been made, and the wood seems quite suitable for the purpose. They say the acetone they get would be in payable quantities and of good quality. But there has never been a practical plant laid down at all to deal with it, so they are practically in the dark yet as to what should be done. Quite lately there have been suggestions to put down plant here, and I believe people have been out from home with that view. Exactly what success they had, I do not know. The inquiries were carried out in a private manner, so we cannot say what the position is in regard to the production of acetone.

6415. Would it be an advantage to the industry?—A great advantage, because it would relieve the planters of a great deal of waste stuff that to-day is not used simply because it cannot be sent away in a payable form.

6416. It was represented to us that the proposition had been put before the War Office unofficially?—Yes, I believe that that was done some six or seven years ago.

6417. When Sir Matthew Nathan was Governor?—Quite so, but they appear to be able to give us no assurance that there would be a market for it.

6418. Is the wood waste now?—Large quantities are waste, quantities that are a considerable distance from rail simply because there is a shortage of labour, and in order to cope with this, of course, a large quantity of labour is required for getting this timber. We sell it now principally for fuel and mine props. The majority of it, however, is not suitable for mine props, being crooked and rather small, and that is suitable only for fuel. At the price that fuel is sold it would not pay to move it great distances, so, of course, large quantities are wasted in consequence.

6419. You speak of a shortage of labour; what do you pay for the native labour?—It varies very much indeed, but the average is somewhere about 30*s.* a month, with keep and housing.

6420. Is that the highest?—No, that is about the average. It varies considerably.

6421. Is that a fair average?—Yes, for ordinary unskilled labour.

6422. He receives his food?—Yes, it is principally mealie meal that he gets.

6423. **(Sir Rider Haggard.)** Has it ever occurred to you to make this into charcoal?—Yes. We have produced charcoal, and as far as we are personally concerned we have a gas-producing plant in which we use charcoal, and it is excellent, apparently as good as the best English charcoal. We have had reports from England and the Continent to that effect.

6424. Why do not you do it on a large scale?—Simply for the same reason I gave before—the shortage of labour.

6425. It is a paying thing. It is worth 5*l.* a ton?—No, not here. We get about 40*s.* a ton at the outside. Small quantities of charcoal are sold at higher prices than for large quantities.

6425*a*. You talked about boys getting 30*s.* a month with food and housing; at what sum do you lay the cost of the food and housing?—I suppose 6*d.* or 9*d.* a day would cover those.

6426. As regards charcoal, it does not involve much labour—placing this material in the retort?—No, except the collection of the timber and transport to the retorts.

6427. **(Mr. Bowring.)** May I ask something about the process of stripping; what is the process?—As a rule, the trees are nicked at distances of 7 or 8 feet up with an axe. A nick is made round the stem and the blade of an axe is inserted and the bark drawn away down the tree to the roots. That tree is then cut down, the branches cut off, and the remaining bark stripped off. It usually comes off very easily if the tree is in a healthy condition.

6428. There is no soaping or boiling necessary?—No, it is quite unnecessary.

6429. **(Sir Alfred Bateman.)** Are there any other points?—May I bring up this one point? We feel that we are under a certain amount of disability in regard to our market in Hamburg, principally on account of the arbitrary manner in which they decide whether or not the bark is of good quality. They have an arbitration board, on which we are not represented, and cannot be represented, and the awards of the board are entirely on the buyer's side. We feel that to be an injustice.

6430. It is called arbitration?—Yes, but it is nothing of the sort, of course. It is a most extraordinary position. I wondered whether this Commission would be in a position to do anything to help us in that way. Of course, we are taking what steps we can to overcome these other difficulties, but this matter is one rather beyond us.

6431. If they want your bark I should think they would agree with your conditions?—Unfortunately, the market is principally limited to Hamburg. The American market would take a great deal, but I am not certain whether they are sure that they like our bark yet. They are testing the bark at the present moment, but we have no report that they will take large quantities. They may not be in favour of it.

6432. **(Sir Rider Haggard.)** How many tons do you say you send every year?—Last year, 65,000 tons.

6433. Is it increasing every year?—The previous year it was 52,000 tons. It has increased, but there has been a considerable check owing to the drop in prices.

6434. What amount of bark does an average tree give?—I suppose a good tree would give somewhere about 60 to 70 lbs. of dry bark.

6435. **(Mr. Garnett.)** I would ask whether you have any figures showing the increase in your exports since the war?—I have not got them here, but the Union has them.

6436. Do they show a continuous increase?—Yes, a continuous and very substantial increase for the last ten years. I can give the figures for the last twenty-eight years, since the industry commenced, if you wish them.

6437. **(Mr. Campbell.)** You spoke of not being represented on the tribunal at Hamburg; for what reason are you not represented?—Simply because, apparently, they hold the power in their own hands, and they refuse to allow us to be represented. They say the thing is quite fairly conducted, but it is peculiar that we are not allowed to have a representative present.

6438. **(Mr. Garnett.)** Is this arbitration committee in Hamburg a kind of grading committee that sits and adjudicates on the various kinds and grades of bark that are sent? Do they fix standards?—So far as we are aware—no. But if any bark is called into question as to whether it is f.a.q. (fair average quality) as a rule they claim a rebate, and if the rebate is refused it is referred to this court of arbitration, as they call it.

6439. Is there no grade that has been settled on as f.a.q.?—None definitely.

6440. And your claim is that you should have a representative on this arbitration committee?—Yes. We frequently send away bark which is known out here to be fully up to the standard known as f.a.q., because it varies very considerably, and when it arrives

at the other end it is stated to be inferior. What we have noticed is that when the market is falling there are many more arbitrations than when it is rising. That is our fear—that it is not always fair.

6441. **(Mr. Garnett.)** In many export businesses one has to be, so to speak, at the mercy of the surveyor, where these surveys take place at the other end of the world, say in India or China, and your grievance is that where the arbitration board is a sort of packed board, like this one at Hamburg, you have no facilities for your case being watched?—Yes quite so.

TRANSVAAL.

Pretoria, Monday, 30th March 1914.

Mr. IZAAK JACOB HAARHOFF, J.P., called and examined.

(*For the evidence of this witness on "Land Settlement," "Animal and Agricultural Produce," and "Fruit," see pp.* 45, 249, *and* 319; *and on "Mining" see p.* 33 *of* [*Cd.* 7707].)

6442. **(Chairman.)** You have something to tell us as to the timber?—Yes. We have timber in this country—mahogany and teak—and other kinds of which I am willing to submit samples to the Commission, and I should say we have an area of about 10,000 square miles with this timber. At the present time it is barely touched, it is only used for mining props.

6443. **(Sir Rider Haggard.)** What is used for mining props?—This teak and mahogany is being used for mining props. We have at least 10,000 square miles of this timber.

6444. Where?—In the Eastern Transvaal and in the Zoutpansburg district in the north.

6445. **(Mr. Bowring.)** Are all these timber areas taken up by companies and private individuals?—As a rule private people buy the rights from the owners of the farms to cut the timber, and the Government has also a lot of these timber lands.

6446. You say the Government still retain a good proportion of these timber areas?—Yes.

6447. And how are they to be obtained from the Government, supposing you wished to go into the timber industry in this country?—I cannot tell you definitely, but I think there are certain rights which they can acquire from the Government, and I do not think there would be any difficulty about that.

6448. You think they might be obtained on reasonable terms?—Yes, I know that timber rights like those have been sold at 10*s.* an acre.

6449. **(Mr. Tatlow.)** You said that no one here thinks it worth while going into the teak wood business although it ought to be very profitable, commanding such a good price as it does in England and Europe?—Some of it is being used in the Railway Department now.

6450. But I mean for export?—I cannot say.

6451. Why is it that no one sees the possibilities of making money out of such valuable wood which is in such great demand?—Well, the man who has money would rather put it into mines and land, where he can make bigger profits.

6452. Does that mean that the mining industry swallows up all the available capital?—That is a fact, there is no capital for anything outside.

(d) Wine Industry.

CAPE OF GOOD HOPE.

Cape Town, Friday, 27th February 1914.

Mr. JOHN MCDONALD, representing Messrs. H. Collison & Co., Wine Merchants, called and examined.

6453. **(Chairman.)** You have some evidence on the wine and brandy trade, I believe?—Yes.

6454. Have you a précis of it?—I have a short note which is as follows:—

Though I only came out here to reside permanently last year, connection with Collison's dates back about eight years, and have been in virtual control, with occasional visits, for the last four.

At present the home demand for wines is equal to the supply; still, as there is an enormous area of country specially adapted for vine-growing, the question of developing an export trade is manifestly important, and from the failures which have attended the spasmodic efforts made in the past, the question evidently requires to be tackled in a business-like and methodical manner, if it is to achieve even the success attained by Australia, which has not the same advantages as South Africa.

The Government did a great work in establishing the co-operative wineries, but looking at the very excellent wines turned out at such different points as the Government Wine Farm at Constantia and Beyers Kloof, near Klapmuts, it seems a pity they did not retain, to start with at any rate, some control in the appointment of the expert managers, so that the wineries, under skilled experience, might have concentrated their energies on producing the type of wine most suitable for the grapes in their respective districts, as is done in the great Continental wine-growing countries: Spain for sherry; Portugal for port; France with whole provinces devoted to champagne, claret, burgundy, brandy, while the Rhine Valley is given up entirely to hock. In the Cape Province even the smallest farm will give you every variety of wine and deal in dessert grapes as well. This cannot make for uniformity of quality or economy in production.

Without criticising the Excise Bill or the Adulteration Act, it comes within the purview of this Commission to consider how certain provisions handicap the home article as compared with imported liquors. Without doubt, the intention of both parties in Parliament was to improve the quality of the article

sold to the consumer, and if the technical advice on which they relied had been sounder—to say nothing stronger—this object would have probably been attained by going no further than laying down that all brandy must be made from wine. In doing this they have placed South Africa in the unique position of being the only country in the world which has a national guarantee of the purity of its brandy. In all others we know that molasses spirit is blended with their brandy and the whole sold under the latter name and very often as cognac.

In setting up, however, a particular type and giving it an enormous preference, chiefly owing to an ignorant prejudice against a certain type of still, fostered perhaps by certain interests, they have severely penalised 75 per cent. of the wine-growers and compelled the dealer to give the public a spirit most unsuitable for consumption when new, and seriously hampered the manufacturer, as he is driven to produce a brandy for the home market which is quite unsuitable for the large export trade which is waiting the production of a pure light brandy—quiet in flavour and moderate in cost, and which, unlike the wine, requires no pushing or advertising, but will sell on its own merits at the market rates.

Further, a chemical standard has been introduced. Many countries have considered this system, but only one—Australia—has adopted it, and so far even they have again and again postponed putting it into force, and it is now practically certain that they will shortly officially abandon it altogether. Imported cognacs have not to comply with these tests. The chemical standard they could easily arrange from the nearest druggist's shop, but the 22 degrees strength and the stipulation "made solely from wine" would bother them if capable of being enforced.

The whisky standards are a farce. There are three grades set out, but as the finest brands are content with the description "whisky," the definition of pure malt and blended whisky are so much waste paper.

In this connection I might point out that in the Cape Province, by raising the duty on the old or natural type of brandy from 3*s.* to 10*s.* and reducing the duties on whisky from 25*s.* (Customs 19*s.*, Excise 6*s.*) to 21*s.*, a benefit of 11*s.* has been conferred on the imported article. This is important in regard to Scottish whisky, which has everywhere knocked out brandy as a beverage when competing on anything like terms; but looking at the mere question of cost, the initial price of Scotch whisky exported is considerable, because of its high standard of quality combined with age, averaging, as it does, well over five years. But take, say, gin; it can be landed without duty at about 2*s.* per gallon ready to drink, as compared with Cape brandy at 12*s.* in the farmers' hands, full strength and unmatured.

Again, though spirit derived from wine is admitted to be far superior to that from grain, and still more than that from molasses, we find that because the finest gins are made in London and Holland from grain we are prevented from using our much finer Cape spirit for this purpose except at the higher rate of duty, and no guarantee is asked or enforced that the imported gin be made from grain and not from molasses.

If the home manufacturer were not handicapped in this stupid and unfair manner I would undertake to make gin in this country equal, if not superior, to the finest London or Hollands.

158,007 gallons were imported last year, equivalent to 5,000 leaguers of wine, the money for which would have gone into the pockets of the wine-farmers instead of overseas.

I have only been here comparatively recently, but my knowledge is considerable in the export trade. My point rather is that Australia has nearly 1,000,000 gallons to export to England, and South Africa, which is better situated as regards distance and cheaper labour and a perfect climate, has practically no trade at all. At the same time, it appears to me that there must be some effort made to export, as the demand in South Africa is apparently equal to the supply. The supply can be enormously increased, however, from the amount of land which is available for the culture of vines, and which is of very little value for anything else. There is no doubt that as time goes on and they put more land under vines, there will be a surplus of wine, and if they can establish a market outside of South Africa it may be of use for exporting the surplus. I think the advantages are chiefly on the side of exporting the spirit rather than wine itself. Wines have to be of a certain character, and have to be up to a certain fixed standard, and that makes it more difficult to handle successfully. Further, there would need to be a great amount expended on advertising to create a demand for our wines. But if you export brandy, you export an article which is the essence of wine. It is smaller in bulk, and there is consequently less expense in freight for one thing. South African wine will vary in quality and character, but brandy will not, to anything like the same extent. We also know that, taking the English market alone, there is a very large demand for pure wine brandy. At present, almost all the brandy comes from France, where they have no guarantee whatever that it is made entirely from wine. In France they use molasses spirit legally. From South Africa, however, with the new laws there will be a national guarantee that the brandy from here is made entirely from wine, and for that kind there is a very large demand waiting simply till it becomes a marketable proposition. This law only came into force from the 1st January last, and the new vintage has not yet been made. We have no experience, therefore, as to the price or quality of that. But in order to back up my opinion I may mention, for instance, Mr. Pheysey, of the Army and Navy Stores in London. He strongly advised me to press for the making of brandy in preference to wine, because he says there is an enormous demand for pure wine brandy, not merely as the leading supplier for the West End of London, but also speaking for the Continent. In France this year there has been a great shortage of wine, and they drink wine there instead of making brandy of it. There is certainly a demand at present for a pure brandy made from wine, as because of the shortage they have had to fortify their wines with beet molasses spirit. Another firm, Joseph Travers and Son, of Cannon Street, London, have told me that they have had to buy large quantities of Algerian brandy. They gave me samples of it, and I am sure we could easily make similar or even better brandy here; also, I think, at a similar price. They told me they would rather buy Colonial brandy than Algerian, and promised that the moment we could give them that brandy from this country the order was ours. So there is a very strong argument for export from South Africa of good wine brandy. I have mentioned the question of chemical standards and so on, but I do not really think we need press that, because it is under review by the Government, and I think, very likely, that even the advocates of the chemical standard will see the mistake they are making, and that probably the suggestion will be withdrawn. A chemical standard has never been a success anywhere. It was brought up before the Commission presided over by Lord James of Hereford. The question was debated by all the largest chemists in France, and a great authority, Professor Fernbach, said, "If you take the standard of six eminent "chemists who separately examine a standard sample, "they will each give you a different return, because "the personal element must come in in such a test. "It is the same with whisky. If one man examined "a number of samples he will give you correct com- "parative figures. So the chemical standard is a "very difficult one to adopt in practice. Hennessy's "and Martell's both say they could never trust a "chemical standard."

6455. The result of your study of the subject is this: that South Africa should concentrate upon brandy rather than upon wine?—I have come to that conclusion—because it would be easier, and there is a much better market without the trouble, and I know that the Government here, under present circumstances, do not see their way to spending a large sum to advertise our wines in the European market. And

there are other great difficulties in the way. But brandy is a thing which you can sell on a sample.

6456. Would the return to the grower be equally as good?—Yes, quite as good.

6457. What steps would you suggest taking to bring about that desired result?—A recommendation that the chemical standard be abandoned and all brandy made from wine to be on the same footing. The demand over the whole world is for a brandy made from wine, and they should absolutely prohibit the making of spirits from anything else as far as the Cape Colony is concerned, leaving to Natal the production of cheap spirit from sugar molasses.

6458. **(Mr. Campbell.)** In this précis you mention "co-operative wineries" as doing a good work. What are these "co-operative wineries"?—The Government put them up in certain districts, and the farmers, instead of pressing the grapes themselves in the old-fashioned way, send the grapes to the wineries, which are run on the French plan. They are all equipped with the newest machinery. They make the wine there and then it is sold.

6459. Are they Government institutions?—The Government spent about 80,000*l.* in putting them up, and the farmers had to pay so much to the sinking fund.

6460. Who manages them?—That was left to the farmers in the district.

6461. And you say they have been a success?—From the farmers' point of view. They did not pay the sinking fund, but the Government has let them off that.

6462. It has improved the quality of the wines and increased the trade?—Yes.

6463. In your statement you say: "In setting up a "particular type and giving it an enormous prefer-"ence." What does it mean?—In the cognac district of France they make cognac brandy, and that brandy is made from wine which is a very thin and acrid wine. It is made at a very low distillation strength—22 over proof. Well, elsewhere brandy is made at a higher strength, the reason being that only thin light wine will manufacture a brandy at lower strength. This point was not brought up here, and they did not recognise that there is only one small district in France where you can do that. They thought you could make it here as well. They therefore gave a very large preference to wine at 22 It was a mistake.

6464. Does that refer to the South African Government as setting up a particular type?—Yes. The duty on brandy of the cognac type is 5*s.*, and on anything above that it is 10*s.*

6465. In another paragraph you say: "The Govern-"ment, by making it incumbent to manufacture all "brandy from wine, has placed South Africa in the "unique position of being the only country in the "world which has a national guarantee." But is it not a fact that the Australian Commonwealth also compels the production of brandy from grapes?—Not to my knowledge. It may be so.

6466. You also speak of the increase of the duty on the old or natural type of brandy from 3*s.* to 7*s.*, and the reduction of the duty on whisky from 25*s.* to 19*s.*, and you say that a benefit of 11*s.* has been conferred on the imported article. With respect to those figures, you put down the customs at 19*s.* and the excise at 6*s.*, and you calculate the total duty as 25*s.*; I would ask—was excise levied as well as customs?—Yes, in the Cape Province. Here we had a customs duty of 19*s.* and an excise of 6*s.* That was not in the Transvaal or other Provinces.

6767. Later on, you say in respect to gin, it can be landed without duty at about 2*s.* per gallon ready to drink, as compared with Cape brandy at 12*s.* in the farmers' hands. There is a duty on gin; what does it amount to?—21*s.*

6468. What is the excise on Cape brandy?—Now 10*s.*

6469. So the prices are comparatively imported gin 21*s.* duty and 2*s.* value of spirit, that is 23*s.*, and Cape brandy 12*s.* value of spirit and 10*s.* duty, 22*s.*?—I take the market price as 12*s.*, but the Cape brandy is of higher strength than the gin. The gin is ready for drinking. It is higher proof strength, so it is not quite so far apart. The actual cost of that brandy would be more like 8*s.*

6470. So those figures rather show that Cape brandy ought to be able to compete quite readily, do they not?—Yes, it was only the question raised before that there was an enormous difference between the duty charged on gin and the duty charged on the brandy when it was only 3*s.* Cape brandy rose last year from 6*s.* to 12*s.* 6*d.* So they brought the duty up to 7*s.* Some people who do not care about the flavour of Cape brandy really were nevertheless ready to drink it because of the difference in price.

6471. You refer to whisky cutting out brandy as a beverage. But that is not peculiar to this country, is it?—No, I refer to the whole world.

6472. The method of imposing duty in England operates as seriously against the Cape wines as the Australian, does it not?—I tried last year through our association over there to get a remission of duty in the case of Colonial wine, but our amendment was not carried.

6473. I mean that the method of imposing duty operates against the South African wines?—Yes, the Colonies get no preference. Our own trade holds that we should.

6474. And the lower spirit content of French wines allows them to be imported at better rates of duty than South African wines, which have a higher spirit content?—No. Because 30 degrees is the English limit, and our wines are under that. They can compete on equal terms, but they get no preference.

6475. **(Mr. Lorimer.)** In respect to your statement as to the failure of South Africa's efforts to establish an export trade, do you refer to the failure to find a market?—Yes. The spasmodic efforts of separate wine merchants are responsible for the failure. At different times the Government shipped wine, but in the end they had to sell it by public auction, or private tender, and had no return.

6476. Was that on account of any defect in the wine itself or the management over there?—Probably the management over there. Because South African wine is unknown, and unless it is advertised, and has a standard, it is at a disadvantage.

6477. Was it tested here first?—Yes. I do not think it was so much a question of the quality as that there was no market.

6478. But, still, if the wine was good enough there must be somebody to blame in not finding a market?—If a wine is unknown and goes on to the market without any pushing, nobody knows what it is.

6479. Is it the fault of somebody here not advertising it?—Yes.

6480. Would you kindly explain what the object of the Government was in establishing these wineries?—To improve the manufacture of the wine.

6481. But what steps did they take? Was the co-operation in regard to the quality of the grapes or in the method of preparing the wine?—The method of manufacture.

6482. While they took the initial steps they stopped short just when it came to the management of them?—Yes.

6483. What was your complaint about the excise duties?—Only that they vary. 5*s.* to 10*s.* for wine brandy.

6484. Have you made representations to the Government?—Yes.

6485. **(Sir Alfred Bateman.)** In regard to the wine, is it not the case that there is no uniformity in wine of the same brand?—Yes.

6486. In colour or taste even. We had your wines on board ship, and we found that there was a difference in two bottles of hock of the same brand?—Yes, in regard to wine, there has undoubtedly been a difficulty. The wine varies with each vintage, and each manufacturer gives you a different wine each time. If you call for Hermitage of different merchants out here, you will get a different kind each time.

6487. If you order a certain brand of wine you expect to get the same thing always?—Yes. But it has been the curse of South Africa. Everybody has

been allowed to do as he pleased. I suggest they should draw up a standard of uniformity for each brand and nothing but wine conforming to that standard should have the Government stamp, and no other wine should be allowed to be exported.

6488. In regard to spirit, can you provide that the spirit is always wine spirit?—Yes, but not by analysis, only by supervision.

6489. Chemical analysis would not tell you if there was a certain amount of molasses spirit in the brandy?—You would not be able to tell in regard to whisky more easily than brandy.

6490. You think it would be possible to guarantee a market for spirit imported from this country in the shape of brandy?—Yes. I have an order now waiting. There is a large market in London.

6491. What do you want the Government to do?—If they left it alone as they started, that only brandy made from wine was allowed to be made here, that would be sufficient.

6492. You say you cannot tell them by analysis?—It must be manufactured under supervision.

6493. You suggest it should be manufactured under control?—Yes.

6494. **(Sir Rider Haggard.)** Is there any amount of land capable of producing wine here?—Yes, a huge quantity round Paarl, Stellenbosch, and that district. That light sandy soil is all eminently suited for the purpose.

6495. Can that land be bought at a reasonable price?—Yes.

6496. Therefore, there is no limit to the amount of wine brandy that might be produced?—No.

6497. And you have informed us that there is an eager, if not an unlimited, market for your brandy?—Yes.

6498. Therefore, you have within your grasp a most profitable enterprise if only those responsible will take the trouble to organise and set the thing going?—Yes.

6499. Perhaps it would not be too much to say that it would bring great wealth to the country?—Yes. I have so much faith in it that I have put my two sons into the business.

6500. Could you, with proper care, grow some really fine wines here?—Yes, I think so. They have got to choose their grapes, and lay them out more methodically than before. You have the climate and a soil admirably suited to the growth of good wine.

6501. That should produce a really fine wine?—Yes.

6502. It is merely a matter of enterprise, of skill, and of organisation?—Yes.

6503. And the reward lies in the grasp of those who choose to take it?—Yes.

6504. What is the average value of this land?—I am afraid I cannot tell you that. Where you have the land already under vines it is very valuable. A man who is capable of bringing in and can use the land can get the land quite cheaply and get on well.

Cape Town, Wednesday, 4th March 1914.

Senator the Hon. Sir J. H. MEIRING BECK, M.D., called and examined.

6505. **(Chairman.)** I understand that you are prepared to give evidence in regard to the wine industry?—I have been asked to come here to-day, and shall be glad if I can be of any assistance.

6506. Would you prefer to make a statement or answer any questions?—I am not exactly prepared to make a statement at such short notice.

6507. With regard to the leading facts regarding past development and the present prospects of the wine industry here, what are they?—With regard to the past, of course you all know that the wine industry is an old industry, which was brought here at a very early period of our development by the early pioneers. It was established where it is to-day chiefly in the Western Districts. It became an enormous factor in regard to closer settlement, and it has in consequence always been a very powerful factor in the development of the country, owing to the fact that it brought a very large number of agriculturists sufficiently close together to develop an organised life. At a comparatively early period these people developed socially, and as time went on became a great benefit to the country, and from that date, I think, we may date the beginning of our development in education and many other departments of social life. I mention this to show that it has always been a very great factor in improving the conditions of the community. I think I am correct when I say that from the very earliest possible times it was found that the vine would flourish here as well as in any other part of the world, and that there was almost endless scope for cultivation.

6508. Can you say anything as to the actual increase of production?—Yes; I do not know that I can give you very absolute figures, because at present our statistical department is not arranged in such a way as to enable one to give absolutely accurate information; but, roughly speaking, we are producing to-day about six million gallons of wine and about one-a-half million gallons of spirit. I may say that our output to-day is very much what it has been for a considerable period; there has not been a great deal of expansion, but it is partly due to the fact that some years ago there was a serious set-back owing to the introduction of phylloxera. We are now beginning to overtake the position we enjoyed before the introduction of that disease, and I think that the amount of wine we are now producing is about the same as it was immediately prior to this disease.

6509. What can you say in regard to the quality of Cape wines?—I do not think that there can be any question that the quality has improved enormously of late years, and that to-day we are able to put out probably as good a wine as most other countries would be able to do. In connection with this I have here an article which may be of use, inasmuch as it expresses an opinion, not of anybody interested, but an authority which I think will command respect. Some years ago Messrs. Sedgwick and Company, a large firm of wine merchants here, were desirous of testing the quality of Cape wines, and sent a considerable number of ordinary wines, such as are sold here, to England; those wines were analysed and examined by people in England, and the "Lancet" published an article, part of which I hope I may be allowed to read. It is only a very small extract.

6510. Will you give the date?—It was somewhere about 1908, I think. It says, "Year after year the "quality of wines produced in South Africa improves. "In the past they have shown a somewhat high "alcoholic strength and a relatively large proportion "of sugar, but now with regard to the bulk of these "wines there has been a great improvement." I may say here that it was the general idea formerly that only heavier wines could be successfully grown in the Cape owing to the richness of the soil and the strength of the sun. Well, I would like to say that is not so. We have a very wide range of temperature, and there is a great difference in the climate between one portion of the country and another. You will see the northern pine flourishing almost side by side with the sub-tropical palm, so that we have been able to grow the lightest as well as the heaviest wines. Evidently the "Lancet" had that idea also, as it goes on to say, "The above firm" [that is Sedgwick and Company], "have

" sent to us specimens which, on the contrary, are " wines delicate in character and approach the light " wines produced in Western Europe," and it proceeds to give an account of individual examples of our wines such as Cabernet Sauvignon, which is a wine of the Burgundy type; Hermitages, which are of the claret type; Drakensteins, which are of the Moselle and Rhine wine type, and so forth, all of which gave most satisfactory results; and as regards constituents, it spoke favourably of the alcoholic strength, the percentage of sugar, and so on. That was some years ago when these returns were published, and I am pleased to say that there can be no question that since that time there has been a very great improvement, and I have no hesitation in saying to-day that we are able to produce, both as regards heavy and light wines, as good a quality as anywhere in the world wherever wines are known and appreciated.

6511. I see that your present production is about six million gallons of wine and one and a half gallons of spirit. Now how much do you export?—A very small amount. We have never really endeavoured to export our wines as Australia has.

6512. All your wine is taken for local consumption?—The bulk of it undoubtedly is, but a small amount is exported.

6513. Is it possible to give the average of your price for the ordinary quality of wines and spirits?—I think so. I am speaking as a grower, of course, and not as regards the consumers' price. As a grower, we are at present getting from 5*l.* to 10*l.* per leaguer, which is more or less 127 gallons; 10*l.* for the very best, and 5*l.* for the ordinary wines.

6514. That is 1*s.* and 2*s.* a gallon?—Well, you may say from 6*d.* to 1*s.* a gallon.

6515. Now as to the comparative profit in wine and spirits. Is it a fact that the production of brandy is taking the place of wine?—At present, yes, it is to a large extent, but I do not think that is due to the fact that there need be more profit in one than the other. It is rather due to the fact that for various reasons the community have rather developed the habit of spirit drinking than wine drinking. The result is that to a large extent growers, in order to get a market, have gone in for the marketable commodity.

6516. Is all this spirit used for drinking?—Yes.

6517. It is not denaturalised?—No, but during the last five or ten years there has been an increased consumption of wines, and we are always hoping that we shall increase the consumption of good wines as we go along.

6518. Can you tell me what proportion of the total consumption of this country is of wine and what is of spirit? I mean as compared with the wine and spirit imported?—Well, we do not import a very great deal of wine here, only the superior wines such as champagnes and clarets. We import a small quantity of those, but our imports are mainly in the form of spirits. I have here a small paper which I wrote in 1909 on the subject. In that year, 1909, I find our imports amounted to 447,000 gallons of whiskey.

6519. What is the total consumption of the country; I understand you furnish about three-quarters?—I should think we furnish rather more than that, but three-quarters is probably near enough.

6520. And I understand you want to supply an even larger proportion?—Yes.

6521. By what section of the community are the wines consumed?—Well, in the past, to a very great extent they have been consumed by the labouring classes, but I am glad to say that with the improvement of wines and also the better appreciation of their qualities, a considerable consumption is now arising among the higher grade of consumer, and we are to-day developing a considerable consumption of high-grade wines.

6522. Are there any points you would like to bring out?—I should like to say that I think that by the judicious employment of capital and enterprise there is an enormous future before the wine industry in this country and enormous prospects, particularly for the comparatively small landowner, because you require a comparatively small patch of land for the purpose of growing vines; and then there is another reason why I say that. Land which is fit for growing vines is also fit for other purposes. For instance, we have lately developed a considerable industry for the growth of Turkish tobacco, which the wine farmer could combine with the wine industry. It could be developed on comparatively small holdings with very reasonable prospects of success. The same thing applies to fruit trees wherever the vine grows.

6523. Now as to the comparative profits to be made in this branch of cultivation as compared with other kinds of farming. What have you to say upon that point?—I do not think that there is any question that given good years and reasonably favourable circumstances, wine culture will compare favourably with any other form of agriculture that I know of.

6524. At your present level of prices?—Yes. I wish to say here there is another reason why the cultivation of the vine gives a comparatively certain guarantee of success, that is, that in addition to the vine itself there is to-day a large market for the fruit of the vine, I mean grapes for table purposes, and raisins, so that we have an extra market in that direction, and the grape grower is in a favourable position. He has a crop which he can grow on a small patch of ground, and he can cultivate other things on the same ground, and it gives him, so far as the vine is concerned, several strings to his bow.

6525. **(Sir Jan Langerman.)** What do you calculate to be the acreage of ground under vines to-day in the Western Province?—In the absence of really definite statistics it is not possible to say, but I should think about 25,000 acres.

6526. Then you think that is capable of considerable expansion and that there is a lot more land available for the purpose?—Yes, unlimited expansion.

6527. What would be the price of such land if one wanted to cultivate vines?—Of course, the price must necessarily vary according to where you propose to buy. Many of these western districts are fairly filled up, and in those cases the prices are higher than in other districts, but, roughly speaking, I should say that land in the western districts of the Colony capable of bearing vines should be worth from 10*l.* to 40*l.* an acre.

6528. How many acres would a new-comer require in order to make a decent living?—What do you call a living?

6529. Suppose he got 10 per cent. on his outlay?—Are you talking of a man who works himself?

6530. I am talking of the man who buys a bit of ground and wants to start vine farming.—Such a man would require perhaps an income of 200*l.* to 300*l.* a year and he could make that on a very few acres.

6531. He would require a small capital to start with?—Yes, comparatively small. If the individual starts work himself he puts his own back into it and he would probably have to put up the money for the land as well as the planting, and planting is comparatively expensive. I should put it down at 30*l.* an acre, but he would have the advantage in three years of a good return.

6532. Suppose a man puts a capital of 1,000*l.* into the business and is able to tide over the three years, he would then be able to look forward to an income of from 300*l.* to 400*l.* a year?—Yes, I should say that if he is successful in obtaining suitable land, that result is quite possible.

6533. Is there much scope, then, for land settlement purposes?—I think so.

6534. There is good hope that in the future grape growing and wine farming, with other classes of small produce, will provide quite a large scope for settlement?—Yes, that is why I say a man in this line of business is not confined to one thing only; he has other directions in which he can develop.

6535. **(Mr. Garnett.)** We have had it in evidence here that the crops produced from the vines are very heavy?—Yes. Some years ago a number of interesting papers were published by a gentleman who devoted a great deal of attention to this matter—Professor Hahn—and he came to the conclusion that in some of our districts the yield was probably greater than in any other vine-growing land in the world. We have districts

like Robertson and Montague where the yield is simply prodigious. In Stellenbosch and Paarl, however, we come down to conditions which approximate more to those obtained in Europe, but even there the yield is relatively large.

6536. It was also stated that a good deal of the so-called grape brandy even in the cognac districts of France was not absolutely pure grape brandy. Have you anything to say?—In France I have no doubt it is true.

6537. You are of opinion that there are great prospects in this country for an industry making a pure grape brandy?—Yes, because our grapes are cheap and easily grown, and, given suitable varieties of grapes, there seems to me no reason why we should not produce a good brandy. Our land is also comparatively cheap.

6538. **(Mr. Bowring.)** In many cases the farmers sell the grapes on the vines, do they not?—Yes.

6539. Do they not manufacture wine at all in such cases?—Yes.

6540. Can you tell us about the value of grapes which are sold in that way?—Well, of course, where farmers sell in that way they naturally sell for local consumption: for export purposes they pack them rather carefully. But as a rule for South African consumption, they will get from 3*s.* to 4*s.* a basket containing about a bushel delivered to the nearest station.

6541. Those would be grapes for the table, I presume?—Yes.

6542. But is there not an enormous quantity of grapes sold for wine-making which are sold as they stand?—No. As a rule the grower makes his own wine, but of late years we have developed a few co-operative associations; they buy the grapes in one sense. All the members bring their grapes into the co-operative winery and they are paid so much per ton, but they are personally concerned in the making of it; they make the wine co-operatively.

6543. Could you give us an idea of what the grapes are worth per ton?—From 4*l.* 10*s.* to 5*l.* when sold that way, but as a rule where grapes are sold like that, if any profits are realised, there is always a prospect of bonuses being subsequently declared to supplement that price.

6544. **(Sir Alfred Bateman.)** I understand you to be of the opinion that the census returns are scarcely accurate?—We have never really had an organised statistical department.

6545. The figures are not quite the same as yours. For 1911 they show seven and a half million gallons of wine were made, whereas I think you stated the figure at six million?—It is quite possible, we have varying quantities every year and at the present time, I should say, there is a tendency for some expansion.

6546. For brandy they only give 620,000 gallons and I think you gave the figure as one and a half million?—Yes, I have taken my figures from a report which was issued by a commission which sat to enquire into this matter.

6547. Probably yours is the latest intelligence?—No, I do not think it is as late as yours, but I do not know whether that would apply to all the spirits. I did not mention brandy in particular, I said wine spirits. Possibly that may account for the difference.

6548. What market is there for a great deal of wine? You see people in England drink less and less wine every year so you could not expect a very big market there. Where could you send it to?—I think we have a sufficient market locally. Six million gallons is nothing for our population.

6549. Do you mean for the white population?—Just think for a moment of the enormous production of other countries. Granted wine drinking instead of spirit drinking habits, the white population here and the civilised portion of the coloured population should be able to consume a great deal more than is now produced.

6550. Are you in favour of manufacturing brandy under control? Would you recommend the State to superintend the manufacture of brandy and see there was nothing in it but the pure grape juice?—That is practically what we are doing now. Our Excise laws and Adulteration laws are probably the most stringent in the world and we are to-day controlling the manufacture both of wine and spirits very thoroughly. Our legislation on this subject is probably far in advance of any other legislation that I know of anywhere, and there is no question that our wines are extremely pure. In regard to Excise, as you know, there is a certain difference made in the amount of excise levied on wine brandy as compare with other products. Well, the result is that a fairly strict Excise supervision is maintained. You may say that the thing is practically controlled.

6551. Then you think the making of brandy from grapes is controlled already?—Yes, practically. It may not be legislatively controlled, but owing to the strict Excise arrangements the control is there.

6552. **(Mr. Sinclair.)** Under exportation of wine at present, is there any system of Government certification of quality?—No, I do not think there is. As a matter of fact, as I have already said, we have not developed anything very much in the way of export. A certain amount has gone forward in various directions, but we have no Government supervision.

6553. Do not you think that if there is a prospect of your being able to export largely in future it would be well to have a system of grading?—Yes. I can only see a benefit arising from a guarantee to the consumer that whatever he buys is good.

6554. There is a certain amount of variation, is there not, in the same variety of wine produced to-day?—Yes. Well, there is everywhere in the world, because the vintages vary from year to year.

6555. If there is grading up to a certain standard it would help the sale of your wines in other countries, would it not, when you are in a position to export?—Yes.

6556. I suggest that the grading of produce in some of the Colonies has made an enormous difference to the exports?—I do not think one can doubt that for one moment, we have gone a considerable way in introducing grading in various directions.

6557. It has scarcely reached the time when it has become practicable?—No, not in regard to wine.

6558. **(Sir Rider Haggard.)** You told us that the price paid to the grower is about 5*l.* 10*s.* for a leaguer of 127 gallons?—Yes.

6559. What price is paid by the consumer?—I should be sorry to say, it depends on a hundred and one different things. Individual sellers have a knack of putting on individual prices. I have this much to say, however, that the consumer pays a great deal more than he ought to pay.

6560. If you want to make your wines popular, ought there not to be some system under which fair prices are charged to the consumer?—Undoubtedly, that is one of our chief troubles in this country.

6561. You are aware, no doubt, that in France wines are sold extremely cheap?—Yes.

6562. Have you anything in view or any proposal to make to deal with that aspect of the question?—For years past a number of us have tried to move in that direction; we have succeeded to a certain extent. For instance, on our railways here, where considerable quantities of wines are consumed, we get them to put the wine forward at fairly reasonable prices.

6563. How do you do that?—The Government caters for the passenger traffic and fixes the price of its wines, and to some extent that has created a standard in the minds of the travellers and people generally as to what they ought to pay, and it has, therefore, had an indirect effect in this direction, but the trouble which we have had in this country is the one which I think you have also experienced in England, namely, the evil of the tied house. Now you are aware that wine is a commodity that you cannot sell except through licensed channels, and therefore if you hand over your licences to a large extent to people who are interested in the sale of other things you can obviously see that it is going to be a very difficult matter to get this particular commodity put forward in the way it should be put forward. I do not wish to be unfair. I think a great many of our retail dealers wish to push

our Cape wines and do what they can in this direction, but there is no doubt at the same time that there is an enormous network of influence in the direction I have indicated which works against us.

6564. That is a matter, I suppose, of great importance that should be rectified?—Yes.

6565. And you are devoting your attention to it, and you recognise that you will never get a great market until the consumer can buy his wines at a fair price?—Yes, it is a matter we have given our attention to for many years and upon which we have concentrated our efforts.

6566. You might be inclined to admit that the future of your wine industry depends on the success which you achieve in that direction?—Yes.

6567. I think it was in answer to Sir Jan Langerman, when you were talking about land settlement and at what price land could be taken up, that you said a figure of 1,000*l.* would represent the capital that was necessary?—Yes. I think a man with 1,000*l.* capital would be able to get a piece of land sufficiently large to enable him to make a start.

6568. And you give a very wide price to that land; anything from 10*l* to 40*l.* an acre, I think?—Yes, and even more in some districts.

6569. Well, considering the quality of the land which is required for this industry, and which, I understand, is not suitable for anything else, is there a very large extent of it in this country?—I have tried to show that land which is suitable for vines will also grow other things; for instance, fruit and Turkish tobacco.

6570. But still in motoring about the country I have been shown great patches of ground which they tell me is suitable for vines, and 40*l.* seems rather high for that ground?—Well, probably you would be able to obtain that for 10*l.*; that is why I mentioned the low figure.

6571. It is only picked land which is worth 40*l.*, I understand?—Yes.

6572. Well, it comes to this, that only a man with capital can attack the position?—Yes. I think for successful settlement in this industry a certain amount of capital would be necessary.

6573. Now, suppose a man came to this country and wanted to go in for growing vines; is there anybody to advise him so that he does not lose his money?—Yes, we have our Agricultural Department, which is devoting a great deal of attention to giving advice to new-comers, and we have the Government experimental stations at Constantia and Elsenburgh.

6574. Supposing a young man turned up with 1,000*l.* and said that he wanted to become a wine farmer, would the Department put someone at his service to advise him about the land and so on?—I have no doubt he would get advice.

6575. You see in some of the other Colonies—Australia, for instance—they make a regular custom of this?—Yes, but we have not got the same system here. Nevertheless, I know many instances where people have been given valuable advice.

6576. It might mean success or failure?—Yes.

6577. Generally speaking, this wine-growing is really only in its infancy, is it not; I admit it has been rather a prolonged infancy?—Yes, viewed from the standpoint of its development.

6578. There is a probability of its being enormously extended?—Unquestionably, if we can get the market.

6579. And if you can supply really good wines at reasonable prices to the consumer?—Yes, I have always held that view.

APPENDIX.

(d) Wine Industry.

Memorandum by Mr. G. A. Thomas, Chief Inspector of Excise, Cape Town.

I have been afforded the privilege of perusing the evidence given before the Commission by Sir Meiring Beck and Mr. J. McDonald, and the remarks which I now offer are intended as either supplementary, as far as statistics are concerned, to that evidence or in correction in respect of points raised with which I am unable to agree.

About 6,592,500 gallons of wine were used in the Cape Province in 1913 in the production of 1,465,000 proof gallons of wine, spirits, and brandy. In addition, 261,190 proof gallons of grape and "dop" brandy (spirits distilled from wine together with husks and from husks together with water respectively) were produced.

The entries for consumption in the Union amounted to 1,241,762 proof gallons of both classes.

The exports were chiefly to States in South Africa.

In consequence of the operation of the adulteration laws a large quantity of grapes is used in the production of grape syrup for the purpose of sweetening wines and brandies, which means another market for the grower.

We had no wine available for export last year, as the whole of the crop was consumed in the Union and surrounding States. If, however, as a consequence of the high prices obtained by producers in 1913, the laying down of fresh vineyards takes place to any considerable extent, prices are bound to fall, as the consumption of wine and brandy in this country being limited, no expansion can take place unless an oversea trade is found. In my opinion, therefore, a person contemplating putting money into land in this Province for viticultural purposes is bound to take into consideration the probabilities of an oversea trade. As matters now stand considerable additional planting is taking place on established farms.

The well-being of the trade is undoubtedly most seriously affected by the tactics of the distributors. Retailers charge too highly for Cape wines and spirits, thereby placing the consumption thereof beyond the means of many moderate people.

I have read Mr. McDonald's evidence carefully and have arrived at the conclusion that the Cape brandy he refers to which would be suitable for export in lieu of wine is the product made from spirits distilled at a high strength (60 per centum over proof) reduced with water and flavoured and coloured. The Excise duty on such spirits is 10*s.* per proof gallon. A different rate of Excise duty was placed on wine brandy (cognac type), viz., 5*s.* per proof gallon, provided such brandy is distilled at a strength of not greater of 22 per centum over proof and that it contains 300 parts of total secondary constituents per 100,000 parts of alcohol.

The imposition of the favourable rate on the latter class was brought about by a desire on the part of Parliament to encourage the production of the genuine brandy on the lines of French cognac. In France, however, no standard of strength or percentage of constituents have been laid down, but the palate and nose are relied on. It is obvious, however, that the Cape standard is useless unless the brandy is matured for at least three years.

I am of Mr. McDonald's opinion that it would be easier to create a European market for our brandies than for our wines. Our brandies, if properly distilled and matured, are excellent. The Government holds a large quantity of grape brandy which has been maturing under unfavourable circumstances from five to ten years. I have lately sampled this brandy and a large portion of it is superior to the French brandies obtained in this country. The question remains, however,

whether it will commend itself to the European palate. Highly distilled spirts reduced with water can be flavoured to imitate any cognac and may, perhaps, be successfully exported, but in the case of low strength genuine brandies their suitability for submission to European consumers has not been proved.

The duties in the Union at present are:—

Wine brandy (cognac type)	5*s.*	per proof gallon.
Dop, sugar and grain spirits	15*s.*	,, ,,
Other spirits made from the products of the vine -	10*s.*	,, ,,

The Customs duty on imported whiskey is 21*s.* per proof gallon.

It will thus be seen that cognac type has a preference of 16*s.* per proof gallon, dop, sugar and grain spirits 6*s.*, and other wine spirits 11*s.*

In making his statement as to the Excise on Cape brandy Mr. McDonald has taken the wine spirits other than cognac type. Cognac type is now being extensively produced at the 5*s.* Excise, and if properly matured would make a very good brandy.

Many of Mr. McDonald's replies I am unable to follow, as, for instance *,—Cape spirits at 65 over proof, not brandy, rose to 12*s.* 6*d.* per gallon in consequence of new legislation. I cannot understand what he means by "they brought the duty up to 7*s.*"

While I agree with Mr. McDonald that brandy export trade can be more easily worked up than a wine export trade, I am of opinion that unless such brandy is made from strong wine spirits, reduced with water and flavoured, no uniformity of quality and flavour can be gnaranteed. The genuine brandies distilled at a low strength vary considerably in consequence of the difference of soil, rainfall, class of grapes, &c., prevailing in the several producing districts.

G. A. THOMAS,
Chief Inspector of Excise.

6th March 1914.

To the Secretary,
Dominions Royal Commission.

* *See* Question 6470, p. 303.

(e) Fruit.

CAPE OF GOOD HOPE.

Cape Town, Thursday, 26th February 1914.

Mr. HARRY ERNEST VICTOR PICKSTONE, Fruit Grower, called and examined.

6580. **(Sir Alfred Bateman.)** I understand that you own a farm which is to be visited by the Commission?—Yes.

6581. I also understand that you are prepared to make a statement about your operations to the Commission?—I am prepared to help the Commission in any way I can.

6582. Will you tell the Commission a little about your operations?—Yes.

6583. How did you begin?—I came out here from California about twenty-two years ago. I had been in South Africa before, and after being in California about three months, I saw what was being done there, and I decided that if fruit could be grown there it could also be grown here. I devoted my attention, therefore, to acquiring a knowledge of every branch of the fruit business with the object of coming out here afterwards. I was there about three years and came out to South Africa in 1892. The Rhodes Ministry was then in power and they were taking an interest in Colonial development of all sorts. I met Mr. Merriman in London. He was taking an interest in fruit. I saw Sir Charles Mills also, who was then Agent-General. He gave me a letter to Mr. Rudd, who was Mr. Rhodes's partner. I met him and through his instrumentality I was enabled to get a start in fruit-growing. In fact, he advanced me the money. When I came out here I brought a good number of trees from California of the leading commercial sorts. I may say the Government here gave me a pass over all the railways with the object of finding out the best spot for fruit-growing. I came to the conclusion that the Western Province offered the best conditions and I decided to start here. It was no use starting to grow fruit, however, until we had the proper trees of the right varieties so as to build up a large industry, and the first thing was to start a nursery. I did that in 1892. I may say that in that year Parliament appointed a Commission to enquire into the fruit business, and the Commission issued a report. I think it was a very valuable enquiry. I was talking to Sir James Molteno yesterday, the present speaker of the House of Assembly, and who was one of the members of that Commission, and he said that the fruit industry commenced from that date. I believe that to be a fact. I may mention that in 1892, there were only a very few experimental boxes exported to London—probably not more than 100—mainly peaches. It had not been demonstrated that it was possible to export fruit, and peaches were considered too delicate a fruit for sending to England. I then started the nursery, as I said, and began to distribute trees. I saw Mr. Rhodes from time to time and he helped me with a farm. I still have that farm and I may tell the Commission that I have exported and shall export from that one farm from 40 acres of land this year more than the entire fruit export of the whole of South Africa eight years ago. That gives the Commission an idea of the way it is increasing.

6584. What about the value of your exports?—I export the main crop. I am exporting from that farm 7,000*l.* this season.

6585. Consisting of what?—Peaches, plums, nectarines, and pears.

6586. **(Mr. Campbell.)** A yearly export?—Yes.

6587. **(Sir Alfred Bateman.)** Do you employ much labour?—In the fruit season a considerable amount. At present I am employing about 100.

6588. Are they mostly coloured?—Yes. And that includes children. My wage bill for coloured people alone is 50*l.* a week. It varies, and it is much heavier in the fruit season.

6589. Something like 2,500*l.* a year?—No, it would run to close on 2,000*l.* Fifty pounds is exclusive of white labour. They are paid by the month. That means pure day coloured labour.

6590. What does the white assistance cost you?—There is extreme difficulty in getting any labour in the busy time. I wrote to Dr. Muir, Superintendent-General of Education, and suggested that the trade in the Western Province was becoming so extensive and the labour question so very critical that the time had

arrived when South Africa should do as California had done, and should allow the scholars from the day schools to work at fruit picking in the holidays. The holidays fit in with the fruit season. I got a very sympathetic reply and Dr. Muir pointed out that this matter rested with the local bodies. He himself was entirely in sympathy with the idea. I may also mention that a friend of mine at Wellington, also a fruit-grower, had about 10 white students—college boys—one or two had degrees in fact. They were farmers' sons. He had them working during the fruit season at 5*s.* to 10*s.* a day. I came in just after him and took over as many as I could, about eight at 5*s.* They were working for me partly on piecework. I used those until they went back to school, and I have one or two still working. They are extremely satisfactory. The ages range from 15 to 18.

6591. They were worth 5*s.*?—Oh, yes.

6592. They knew nothing about fruit?—No, but they were responsible and disciplined. They give no trouble. All that is required is that they are disciplined and willing.

6593. Besides labour, what are your chief expenses?—The boxes and wood wool, wrapping papers, and so on. That amounts to a considerable sum. This year my expenses for packing material are about 1,500*l.* As regard freight charges I have no complaints, but when one sends 30,000 boxes it comes to a fair sum.

6594. How far do you pay the freight?—From Cape Town to London.

6595. To London landed or to the market?—Well, of course, we pay the freight right through, but I am talking about the shipping company's freight. That is simply from Cape Town to Southampton.

6596. Who pays the rail freight from Southampton?—The Union-Castle Company pay everything through.

6597. You do not know what the freight is?—It is deducted from our invoices. Most of the larger growers have an arrangement with their London agents to pay on the other side, and they deduct from each invoice. I think my freight bill this year will be about 700*l.* or 800*l.*

6598. What becomes of this fruit?—My agent is not a Covent Garden man. He is an ordinary commercial agent who does a large business with Ceylon and India. He has an office in London and a branch in Southampton, a branch in Hamburg, and agents in New York and the principal cities of the world. When the fruit comes he is in touch with the distributing agents, and they inform him by wire what they want, and he distributes a considerable amount direct from Southampton. For instance, the American Line and the North German Lloyd Line of steamers go from Southampton, and I believe a fair amount of stuff goes to America from there. He sends also to Hamburg, and I think that stuff goes from Hull. Then, of course, the bulk goes to London, and is sold privately.

6599. It does not go to Covent Garden?—It does not go into the auction rooms, but it goes into the private salesman's hands.

6600. Does it get to the West End?—Absolutely. If you go along Piccadilly, Solomon's shop is full every day.

6601. It is the West End window more than the coster's barrow?—It has been on the coster's barrow, but we must keep it off. You mean that it is a luxury for the rich?

6602. Yes.—No, it is not so. The exports this year will run to 400,000 boxes. Eight years ago the export was 35,000, and last year 220,000. It is 3,330 tons up to the present.

6603. Is the season still going on?—I have 10,000 still to ship out of a total of 35,000. The season is at its height.

6604. Have you been met fairly by the shipping company, the Union-Castle Company?—I suppose we have. When Sir Owen Philipps came out here he made entirely new arrangements. Under the old scheme we used to pay more for the peaches and stuff that fetched a high price, and less for pears and grapes. But the growers met Sir Owen Philipps, and we found him most reasonable. We suggested an all-round freight rate, because sometimes we got more for our pears than peaches, and it was unfair to pay more for peaches and delicate fruit. He fixed up a rate of 40*s.* a cubic ton for cold storage, and 25*s.* in the ventilated hold, and the company guaranteed the temperature of the ventilated hold. At that rate I think it is quite satisfactory.

6605. When did that begin?—Last season.

6606. It is working satisfactorily under the new contract?—Yes.

6607. Is there anything more to say about the growth of the industry?—I think what the Commission wishes to deal with is the possibility of extending Imperial trade. As far as the fruit trade is concerned there is no doubt that it is going to be a very big thing—far bigger than I anticipated. I expect to see within two or three years our export trade run up to 1,000,000 cases, and within ten years to 5,000,000; in other words in about ten years the export will be worth to the Union 1,000,000*l.* sterling. You will, therefore, understand that it is a very important thing—the distribution—if we have very much lower prices in London this year. I do not blame the agents at all, but we have had double as much stuff, and our production has almost exceeded the present distributing arrangements, and I am satisfied that these arrangements will have to be extended in many directions. For instance, a lot of our fruit goes to the Continental towns and the provincial towns, such as Manchester, Liverpool, Glasgow, and Birmingham, and the provincial towns do not pay much. Of course, from a grower's point of view, we want to get the highest prices possible. At the same time we are quite prepared to take less prices. My contention is that if the distribution in the United States and Canada were more extensive, we should be able to get better prices. I noticed the other day that the Imperial Government had placed the consular service at the disposal of the Colonies. I do not know much about the Imperial Consular Service, but I think that service is wanting on the commercial side. For instance, in regard to fruit. Take the American printed matter on fruit, and you will see consular reports from all over the world about crops and markets. I have never seen that from the British Consuls.

6608. You know perhaps that a very large amount is paid in America to the Agricultural Department, which is a very extensive Department, and which has the services of the Consuls. Do you anticipate that it would be of advantage if the Consular Service were used as agents?—No, I do not particularly say that, but I say this, that there should be consular reports. I would like a report showing, for instance, how much Cape fruit was landed in Chicago this year. There is a British Consul there.

6609. You think then they do not give sufficient attention to the agricultural side?—As far as fruit is concerned they give nothing.

6610. Have you ever seen the Board of Trade Journal and the Board of Agriculture Journal?—I have.

6611. Well, in those journals there they have some notices about fruit and its distribution derived from consular reports mainly?—I think they give very little. I say the distribution is unsatisfactory, and I am able to bring facts to prove it. It is a matter for the Union Government, I take it.

6612. Have they made representations to the Imperial Government asking that greater attention should be paid to this matter?—I do not know.

6613. Would you like to have closer periods than annual?—Well, even annual would be better than none. The annual figures would suit us very well, because they would be available to prepare for the following year. For instance, suppose I found out that only 500 boxes of Cape fruit were delivered in Chicago during one season, I would know that something was wrong, because Chicago could easily take 10,000 boxes.

6614. The consular report is for the calendar year, and the dates of publication vary. A great

many of them do not appear before the middle of the next year?—Yes.

6615. You want them out in the first three months?—They should be sent in to the Trades Commissioner's office in London or the High Commissioner's office, so that we could get them out early in the season. I think there would be very little expense attached to them, and I think it would be a great guide to us.

6616. How would the Consuls in the inland towns get the information?—I would only want the Consul to let our Government know how many cases of Cape fruit were sold in his particular place.

6617. But how is he to get that information? Where there is a Customs house, such as Hamburg, the records would no doubt show you the number of cases of Cape fruit, but if they come through London I am not so sure?—Well, the information could be got through the leading dealers.

6618. But the dealers might not wish to supply the information, and it might be difficult to obtain if you had to collect it from the various shops?—Yes, it would.

6619. You think they would give the information?—I certainly think so.

6620. Of course, we could not compel them to give the information if they did not wish to do so?—No.

6621. Have you heard of the new International Institute of Agriculture, which is supported by a number of Governments at Rome and which publishes reports about crops?—Yes.

6622. They do not get as far as fruit, do they?—I know very little about it.

6623. Because it is possible there might be some help given by them. They have different machinery of their own?—We want more assistance in every way

6624. You want more assistance in regard to information about the consumption of fruit?—Yes.

6625. And the great advantage that you have is the difference in the season?—Yes; there is no competition practically.

6626. You have competition from Australia to a certain extent?—Yes, but the Australian stuff comes into London two weeks or three weeks after ours.

6627. **(Sir Rider Haggard.)** What is the average cost of your labour per acre per 100 trees?—I have no figures.

6628. Can you give the cost of the labour in relation to the farm?—We do not work out things in that way. I am an up-to-date farmer myself, and I keep proper books, but to give the information you require is impracticable from my point of view. The trees are now in bearing, and a lot of day labour is required. To keep figures in regard to that would mean a lot of unnecessary book-keeping. I have some orchards in bearing and others not bearing, and it would mean separate sets of books.

6629. You can give us no figures about labour, can you?—I can tell you what I pay.

6630. Do you use much native labour?—Nearly all the labour I use is coloured.

6631. Do you grow any small fruit, such as currants?—No; I grow peaches, nectarines, and plums.

6632. What do you regard as the cost, first of all, of suitable land for fruit in your district, and, secondly, what is the cost of planting it?—The cost is very high now, and land is very difficult to get, and I do not think you could get it at less than 50*l.* an acre. That is really good fruit land, and to plant it would cost another 10*l.* an acre.

6633. Not more than 10*l.*, you think?—The trees would cost 1*s.* each.

6634. What trees would these be? Do you mean peaches?—I mean every sort except citrus.

6635. How many trees do you set to an acre?—Generally 20 feet apart; that is, 108 to the acre.

6636. You can do the planting, digging, and so on for 10*l.* an acre you say?—Yes.

6637. Well, that is very cheap, because I believe the price is about 30*l.* in England?—I would like a contract to do 1,000,000 acres at 10*l.* per acre.

6638. Where do you get the trees?—I grow them.

6639. Well, suppose a man comes and wishes to start fruit-farming who does not grow his trees?—Then he buys. I am a nurseryman myself, and my price is 5*l.* a 100.

6640. And what is your price for citrus trees?—My price is 2*s.* and 3*s.* a tree; for the stronger trees 15*l.* a 100 and for the second size trees 10*l.*

6641. Well, how old are the 2-ft. trees?—The trees are generally on three years' old roots, and we prefer to sell one year from the bud.

6642. Would they be good sorts, such as navels?—Yes, they are Washington navels and similar kinds. The price of the trees in California to-day is 4*s.*, so we are selling them cheaper. There is such a great business going on there, and they seem able to maintain the prices. I think the price we sell at is reasonable, and it encourages planting.

6643. Now, with regard to this land you talk about at 50*l.* an acre. Do you irrigate that land?—No, I do not on my property.

6644. Then it is all dry fruit farming?—Yes, except for citrus trees, and they have to be irrigated.

6645. Would that be irrigable land?—No, that would cost more.

6646. Is the quantity of land which is suitable for fruit-growing very limited in this country?—There is great field for expansion, but at the same time there is a great deal of useless land.

6647. Then really suitable land is not plentiful?—No, not in the Western Province.

6648. How about other portions of the country?—There are other parts of the country certainly that are gradually being opened up to fruit. There is the high veldt in the Transvaal, for instance, which is suitable for apples and the coast belt for different varieties of fruit. There is plenty of valuable land in the Union. But the Western Province land is very high in price; I do not say it is unreasonably high, but it is certainly high and land is scarce.

6649. What is a developed orchard by the acre worth as a saleable proposition, say, when it is seven or eight years old?—Well, for instance, Sir Thomas Smartt bought a small piece of orchard four years old at 75*l.* per acre recently.

6650. Well, that is no great advance on the 50*l.* you spoke of. That is only 25*l.* more than the sum you would pay for absolutely naked land. Do you think this is a fair sample?—Well, it is a big question. At Wellington, where you have land on the hillsides suitable for apricots, you can get it for 25*l.* an acre.

6651. Now about the cold storage accommodation on the boats, is that always satisfactory; I mean does it affect the flavour of the fruit?—I do not think that the cold storage has any result on the flavour of of the fruit provided it is picked at the right time. Otherwise we would not get the price in London for our fruit which we do get.

6652. I have been told by people in the fruit trade that they have considerable difficulty in getting fruit with the proper flavour in London owing to the excess of cold or some other cause. But this is not your experience, is it?—No, it is not.

6653. I have eaten Cape plums in London, some of which I may tell you were quite tasteless?—A good deal of fruit goes forward immature and it is no good. But I have seen the fruit on sale in London myself, and Mr. Solomon of Piccadilly, who is a very sound man on that subject, will bear me out that the flavour of the Cape fruit leaves nothing to be desired.

6654. You are absolutely satisfied with the present system, then?—No, I cannot say that I am entirely satisfied. I think, for instance, that we should have some ventilation on board. We have approached the company lately about it. We want a self-registering thermometer showing the variations, if possible. I am satisfied that there should be ventilation, but the flavour is not affected.

6655. Then you think the cold storage has no effect on the flavour?—It has no effect. It would be impossible for our peaches to sell at 5*s.* each if it had. I am confident about it.

6656. Then you think those plums with no flavour are exceptional?—I think they were probably picked immature. I know they do send a lot of rubbish, and a lot of immature stuff, which is capable of doing us a lot of harm. What we want to remedy that is compulsory inspection.

6657. That does not exist?—No. Sir Owen Philipps realised the necessity for an improvement, and he made a preferential rate giving the inspected fruit a reduced rate, and preference in cold storage accommodation. If there is not enough capacity on the mail boat, the uninspected stuff has to stand over. Notwithstanding this a lot of rubbish goes over.

6658. Is there any movement on foot with the object of securing compulsory inspection?—Yes, we are continually agitating.

6659. Then why do you not get it?—For some reason or other the Government will not give it.

6660. You said just now that there is a good market; do you consider there is an inexhaustible market?—Yes, in the Northern Hemisphere.

6661. Any amount of land you can put under fruit will pay its way?—Yes, if it is well cared for.

6662. The market is endless?—That is my view.

6663. Can this fruit be grown so as to return a good profit to the grower?—Yes, a very good profit.

6664. He can do well out of it?—Yes.

6665. How about the Australian competition, does it affect you?—All I can say is that we are not afraid of it. At the same time, Australia is a competitor. They have not perfected their export yet, and they labour under disabilities and increased distance. But the first boat of the present season left Australia on the 10th February under Government supervision. Their Government takes more interest in the matter than ours. They have made special shipping arrangements; they charter a ship and everything is inspected. It is all pre-cooled, and it is not allowed to go on the ship until every Government regulation has been complied with.

6666. Your remarks apply to citrus fruits as well as to soft fruits?—Yes, in regard to the paying possibilities.

6667. There is no disease which is likely to affect the business in fruit?—There is no disease that we do not understand and cannot manage.

6668. **(Mr. Campbell.)** Suppose anyone from outside were to come to this country to start fruit farming, what capital would he require to set him up on a standard that would give him a comfortable living?—2,000*l.* or 3,000*l.*, I should think.

6669. So that, I suppose, you do not look to any great development of immigration by means of giving encouragement to fruit farmers from outside?—There is a lot of room for it, but the whole conditions of the country are not ripe for it yet. For instance, in California, and I expect it applies also to Australia, men can work a piece of land and can earn enough money to keep going until they can live on it. We have nothing of that sort here. It is only in the last year or two that there has been temporary work for whites in the fruit business. There are not the opportunities for a poor man to start as there are in other lands, but if he has the capital and experience he will do better here than elsewhere.

6670. Is there any possibility of conditions altering here in favour of small growers in the way you speak of?—I think it is bound to come. Personally, I have satisfied myself that there is far more money to be made on the small place than on the big one. A man can make a splendid living on 10 acres, and the future of fruit-growing in this country is in favour of the small grower, although it is extremely difficult for him to get a start.

6671. What influences do you suppose would change conditions so that the small holder will have an opportunity of earning money in this way?—Increased crops that we are getting will be most difficult to handle without good help, and for that we shall have to pay a good wage.

6672. And that extension will employ white labour, will it?—Yes.

6673. Is the tendency toward the employment of white labour or blacks on farms?—I have never seen it started until this summer. I have never seen any tendency in that direction until now. I will give you a case. When I engaged those seven or eight white youngsters, the next day I went round to the field cornet, who is the official head of the district. I told him I had always been a white labour man and had engaged white youngsters, and he thought it was a good scheme. Next day he turned up at my place and said: "I was talking to my son last night, and he has "insisted that I come over and see you and ask if "you would take him on." I replied, "Certainly." He said, "I have always been opposed to white labour, "but now I am beginning to see that there is some-"thing in it." You see, we have had a lot of what I may call the "scum" of white men who have drifted here, and they drink and live loosely and have nothing in their favour. They mix with the coloured people and it has created a prejudice against white labour, but if we can only get a respectable type there is no doubt that every year will see more chance.

6674. We hear about the stigma attaching to labour; is there any truth in that?—Yes, that feeling permeates the whole country.

6675. Do you think that that trouble is gradually being ameliorated?—Some of us are trying to do our best to ameliorate it. We have a dried fruit co-operative company at Wellington, and it handles a large amount of stuff—two-thirds of the dried fruit is handled by them—and we were left without labour. We formerly employed coloured. I am chairman of the company and the directors decided that this would be the time to try to utilise white labour. In the past we have had from 20 to 30 coloured men packing, and we decided that we would try whites. One of the directors went to see the Dutch Reformed minister, and they were all keen, and the long and short of it is, that we have been able to get white girls and we have taken on a very respectable type of girl of Dutch family as forewoman. She is really setting an example to the others. What is required is an example. There is a deep-rooted prejudice against work both on the part of men and women, and this prejudice we have to drive down, and I am certain that we have started driving it down, and in a few years there will be a better condition of affairs.

6676. You look forward to the future with hopefulness to the extension of fruit-growing and the gradual introduction of people from outside?—Yes, the gradual increase of small holdings.

6677. I think you said there is sufficient land to extend the industry almost indefinitely?—There is ample land about the Union.

6678. In all the Provinces of the Union?—Yes.

6679. With regard to the difficulties of transport; you had some difficulty, did you not, or the growers of peaches here had some difficulty, about the transport of peaches to London?—Yes, we do have difficulty at times. But really the whole thing is the weather. You cannot export peaches to London to arrive in good condition after rain. The people blame the steamship company, but it is not right to do so. I may explain that I keep check boxes of every shipment, and I open those boxes in my office four days afterwards, and I can tell in what condition that shipment will arrive in London. But if we had ventilation in the cold chambers this drawback would be mitigated.

6680. Do you as growers take any means of checking temperatures and so forth in the holds of the vessels? Do you use the self-registering thermometers?—No, we have tried the system some years ago. We put thermometers in the boxes, but we found that the rolling of the boat in the rough sea prevented them from working. I understand that now there is a thermometer which is suitable for the purpose, and that is what we want the company to introduce on the ships.

6681. You know that the Canadian people use them regularly?—It should be done.

6682. Have you any fruit-growers' association here to protect the interests of the farmers?—We have no

association here. In the districts we have farmers' associations, and the executive of these attends the Agricultural Union Congress, and we are represented in that way, but we have no organisation of fruit-growers pure and simple.

6683. I would suggest that an organisation of that kind would be of very great assistance?—Yes, very great.

6684. No one has had the time or inclination to start such a body?—It has often been tried, but there seems to be no cohesion.

6685. With regard to the difficulty about peaches. Did not the Imperial Institute in London make some investigations into the question of carrying peaches from South Africa to London?—I have not heard of it.

6686. Could you give the Commission some figures showing what is the cost per case of fruit from farm to market?—Yes. The complete cost of one box of fruit from farm to Covent Garden Market, covering everything except value of fruit, would be as follows: Box, wood wool, and wrapping paper, 5*d.*; freight, 6*d.*; railage to docks (including cold storage, bill lading, &c.), 2*d.*; London agents' consolidated charge (covering all expenses, including repacking, if necessary), 2*d.*: total, 1*s.* 3*d.*, plus 7½ per cent. commission, which varies according to value of fruit. The size of box would be 12 × 18 × 3, and its contents 18 to 28 fruits.

6687. With regard to the Hamburg market, do you make any use of that?—Yes, every week my agent sends stuff over there.

6688. How do you find that market compares as to prices realised and as to conveniences given with the London market?—My agent reports very favourably about it.

6689. As to price and method of distribution?—He has not gone into that, but I know that Hamburg is a great distributing centre for the Continent. I can only judge by the prices obtained, which are satisfactory.

6690. Is there an increasing tendency to export to the Hamburg market?—Yes, *viâ* London.

6691. You think that Hamburg will be a serious competitor with the Old Country for South African produce?—No, I do not think so.

6692. You think that the bulk of the trade will continue to go to London?—Yes. There has been a movement on behalf of the German lines to try to get us to consign direct, but I do not think they have met with any success. We had also the Trades Commissioner from Hull out here last year.

6693. Did he meet with no success?—We do not ship direct to Hull. Hull gets the stuff through the London agents. The majority of the growers believe in consigning to one agent and letting him do the distribution. We prefer to distribute through the London house.

6694. I suppose the Union-Castle Company gives you a through freight direct from South Africa to the place of consignment?—I always consign to Southampton.

6695. I presume you are in favour of establishing a much more specialised Government department here, not only for giving attention to the fruit industry, but to deal with the care and oversight of the fruit before shipment?—I am in favour of thorough Government supervision as in Canada and Australia. In Canada, if you send a box of fruit for export and it falls below the standard they fine you 50 cents.

6696. You are in favour of considerable extension of Government activity?—I am in favour of strict Government supervision over our exports.

6697. **(Mr. Garnett.)** Returning to the question of Government inspection. How do the laws you have mentioned in Canada and Australia compare with the regulations of California in regard to the inspection of fruit?—There is no Government inspection as far as I know in California. It is handled by large associations as a rule. But the Canadian and Australian Governments do no inspection except of exports. I am in favour of export inspection, but, as far as I know, the United States have no regulations governing the exports. I do not know of any.

6698. The Californian fruit does arrive in London in wonderful condition?—Yes, it is always standardised. They have been in the business for forty years. It is a perfected system.

6699. By the growers themselves?—Yes.

6700. A voluntary arrangement of their own?—Yes, they have found that it is the best way.

6701. What you would like to see is that standard approximated to in some measure by the Government?—Yes. In regard to our citrus export the Government are already standardising for us. They have taken it up on Californian lines. To pass the Government inspector you must standardise your oranges. It is compulsory.

6702. I gather from your evidence that any complaints about the quality of fruit arriving in London must not be set down so much or at all to the conditions of shipment, but to its being packed immature or shipped after rains?—My opinion is that there is very little loss suffered through the fault of the steamship company during the last two or three years.

6703. I think you have been concerned in the introduction of special plums from California to this country?—Yes.

6704. If it is not an improper question to ask, how did those very expensive grafts turn out?—They have justified themselves. I paid 50*l.* for a stick of wood about a foot long. The apple plums, so highly prized in London, are from one of these. I imported recently some Jaffa oranges from Palestine—some scions for grafting. They have taken me some years to obtain.

6705. We may take it, I suppose, that these costly experiments are thoroughly justified commercially?—Yes.

6706. May I ask if you sell your fruit here or is it sold on your account?—I give my agent absolute control of everything and he can send the stuff where he likes.

6707. The fruit is sold on your account?—Yes.

6708. Is that the general practice?—I think so.

6709. With regard to small farms; you are of opinion that it would encourage white people to take up active work in orchards themselves?—An Englishman came out the other day. He had about 1,000*l.* and he wanted a small farm. My advice to him was to work on different farms for at least a year and then to buy. He has done so. He is already earning 12*l.* 10*s.* per month. Then when he is ready he will be able to invest his money to advantage. There must be a small capital and a willingness to work.

6710. You are of opinion that the fruit-growing will aid in fixing a white population on the soil?—Yes.

6711. In regard to the price of land; you said 50*l.* an acre for the best land and then spoke of purchase at 75*l.* with a four years' old growth?—Yes.

6712. Are the qualities of these lands absolutely comparable?—No, the quality varies very much. When I mention 50*l.* I am confident that you cannot touch the highest quality of land at less than 50*l.*

6713. Then 75*l.* for that orchard was a cheap purchase?—Yes.

6714. **(Mr. Sinclair.)** I gather that you, as seller, consign to your agent to sell the fruit on your account, and generally speaking you are satisfied with the handling of your fruit?—Yes.

6715. I think you said that that system was pretty general?—Yes.

6716. Have you heard complaints? We have had complaints made to us in Australia of the handling of fruit by the agents in London?—I have heard of complaints, but I have had the same agent for fifteen years and never changed.

6717. Then I gather you do not attach much importance to complaints that you have heard of as to the treatment of fruit?—Well, I know there is a fight in London between the private salesman and the auction, and that leads to trouble at times. I do not attach much importance to it.

6718. You favour, do you not, the system of Government grading of fruit before it is allowed to be shipped from here?—I favour a system under which no stuff is exported unless up to the standard fixed by Government.

6719. Is one effect of there being no system of grading that indiscriminate classes of fruit go to London markets?—There is a system of grading, but it is not compulsory.

6720. Would you tell us what the system is?—Mr. Bulmer, the next witness, will be able to do so. He is the Government Inspector.

6721. But you can tell us as far as the system affects your shipments?—I am satisfied with it. It is arranged by the Government in conference with the growers. My complaint is that it is not compulsory.

6722. Is there any systematic State instruction given in the Union as to fruit cultivation?—Yes, there is the Union horticulturist, and several assistants, but not so many as there should be.

6723. You think there is room for an extension of the existing system?—I see that in many States of America they have about four times as many Government men as we have in the whole Union.

6724. The need for that suggests itself as being important in view of the great future you see?—Yes.

6725. You lay great stress on the small holding as being the medium for the development of the fruit-growing industry in the Union?—Yes.

6726. What area have you in mind as a small holding?—It depends on the land, but from 10 to 30 acres.

6727. Land at 50*l*. would be first-class land?—Yes.

6728. That obviously calls for some substantial capital on the part of a beginner?—Yes.

6729. He requires capital, and he would require to avail himself of a system of instruction in fruit-growing, or acquire his experience by practical work?—Yes.

6730. Is there any system under which the State will advance to an intending farmer a portion of the outlay that he has to incur for the purchase of his land and the planting of it?—They have the land bank in the country, but I have had no personal experience of it. They assist with advances, but whether they advance against tree planting or not I do not know. I fancy they do as a matter of fact.

6731. I wanted to see how much the need for capital would be lightened in the case of a beginner coming here to make a start?—There is not much help at present.

6732. That suggests then that capital must be forthcoming to a substantial extent?—Yes.

6733. Now as to labour: is the effect of the assistance that you are able to give the Commission this, that you think in future white labour can be utilised to a large extent in fruit-growing?—I do think so. That is my view.

6734. No beginning has been made in that direction until recently?—No. The best coloured labour is absolutely efficient. It is not on account of inefficiency, but on account of scarcity that we complain.

6735. Now, supposing the white labour were here, and it was decided to try it on the fruit farms, would it be paid at a higher rate than the coloured, or at the same rate as efficient coloured labour?—Well, if it came in at planting time of the year it would probably be paid at the same rate, perhaps a little more, but not much. But coming in in the fruit season, it is paid more—temporary labour at a higher rate.

6736. Then the two classes of labour would find themselves in competition? The white labour would be the better paid, I gather from you?—I do not think they would be in direct competition, but the tendency would be to pay the white labour a bit more for the same work.

6737. Do you think that white labour would be as efficient as the coloured labour?—In this part of the country our coloured labour is most efficient. But I have a farm in the Free State, about 35,000 trees on it, and the Basutos I have there are most inefficient. It takes five Basutos to do the work of one coloured man here. It is not the expense, because they get only about five-pence a day. But they are dear.

6738. That would seem to point to there being a field for white labour?—There is.

6739. But in this area, where you say the coloured labour is so efficient, there would not be so much scope for white labour, I gather?—There would be some scope, but not the same.

6740. I think it is important that we should know what the scope really is?—There is not a tremendous scope at present. It is gradually increasing, but it depends, of course, on the class who come out.

6741. Can you say the extent to which the planting of new areas is going on?—I should say that South Africa is planted at the rate of half a million trees a year—that is fifty thousand acres.

6742. Can you say what proportion that bears to the existing areas under cultivation?—Government statistics on this matter are worth nothing, as they take everything into consideration, whether worth anything or not. But I should say there are in the country about two million fruit trees of some commercial value.

6743. Is the demand for labour for adults or for boys?—I should say mainly for adults. Females could be utilised.

6744. I wanted a rough idea, if you could give it to us, of the proportions of adult and boy labour that are called for?—If you bring people into the country, you want to bring the respectable family so that the children can work in the fruit season. But I am absolutely opposed to young people coming out here and working among natives and coloured people.

6745. What proportion of the labour you use yourself is adult, and what proportion is boy labour?—Of white?

6746. White first, and then coloured.—I have no white adult labour on my place except the staff. This is the first year I have used white labour, and those are boys, about 8 or 9.

6747. Now in regard to coloured?—The boys are nearly all in school. It is practically all adult labour except in the fruit season.

6748. You told us, I think, that the arrangements for distribution wanted extending. Did that remark apply to the United States and Canada or to the Mother Country as well?—I think the distribution is fairly well managed in the Mother Country. It applies to the United States, Canada, and the continent of Europe.

6749. In regard to the Consular Reports, would it be of advantage to growers to get these reports to commence by giving the areas under cultivation, and the seasonable prospects?—In their own places?

6750. Yes.—No, it would be of no advantage to us, because we come in in the off season. What we want to know is what amount of stuff from the Southern Hemisphere is coming in and whether Australian or South African.

6751. **(Sir Jan Langerman.)** You consider the market for fruit is unlimited?—I consider it so.

6752. Without affecting present prices?—I will no say that. Prices have, however, been low this year.

6753. You said you thought that very soon we should be exporting one million boxes. Do you think that will affect the prices?—The price to-day is 50 per cent. higher than ten years ago with one-tenth of the output. I believe that with more consumers the price will keep up. I do not expect the prices to go below this year's for many years.

6754. I understand you think there is some prejudice on the part of white men and women to manual work?—Yes.

6755. Is that not rather a sweeping statement?—I make it without hesitation.

6756. Do not you think the objection refers to working side by side with black people?—I am convinced it is owing to black people being in the country, and I think that employers of labour have never given white labour a show. It is not much encouragement to offer two shillings or half-a-crown a day. There has been no encouragement for white labour in this country. I am inclined to think it will come rapidly when conditions are altered for the better.

6757. What will come rapidly—the inclination to work?—I think the disinclination to work will be remedied by the prospect of better wages and conditions.

6758. So there is no inherent prejudice against work, but it is simply the question of payment?—There is an inherent prejudice.

6759. I think you will find that the prejudice is due to working alongside blacks, and that if an employer would say: in future all my employees will be white, I think you would have no difficulty in getting white people, provided you paid them adequately?—Well, sir, you might have no difficulty in inducing them to come forward, but they might not satisfy you.

6760. The efficiency would be bad, then?—The efficiency of the white labour is satisfactory in many instances, but there is a lot of white labour which is quite worthless.

6761. Would that refer to the people in the country, all of them, or only to what you call the "scum"?—It refers to both.

6762. With regard to the price of land, you mentioned 50*l.* and 75*l.* in this area?—Yes.

6763. Can you get land all over the Union for the same purpose at a much lower rate?—Yes, but there has been so little experimental work done that it is impossible to determine whether it is a safe investment in many ways In other words there is no risk attached to it in these parts, but elsewhere there is a certain risk.

6764. What are those risks?—Take up-country—the high veldt—and the Free State; the risks of hail and frost, and so on. My farm in the Free State cost about 3*l.* an acre. It is very suitable for fruit, but there are these frosts and the hail to contend with.

6765. For immigration purposes there is a lot of land to be had at a nominal figure?—I say there is a lot of land at a small figure, but not where the thing is a dead certainty.

6766. So 50*l.* or 75*l.* is the outside exaggerated figure in relation to immigration?—Yes.

6767. Would it be possible for the small holder to handle his fruit at the same cheap rate and place it on the London market as the large grower?—Possibly better.

6768. Cheaper?—Just as cheaply. Where the large grower loses is in waste. The small holder should have no waste. I reckon this year I have lost a thousand pounds in waste.

6769. How do you propose they should dispose of their fruit?—There are half a dozen agents in Cape Town. Suppose I had 100 trees in bearing. There are half a dozen here who would come out and supply boxes, material, do all the work, write the waybills, and take it all off your hands.

6770. Is there not the danger that the business would fall into the hands of the middleman to buy as he pleases?—I do not think so.

6771. As regards facilities for the purchase of land, are you aware there is a law in existence that anybody who wishes to purchase land may go to the Government, and on paying one-fifth of the purchase price, the Government will advance the other four-fifths for a period extending to twenty years?—The land bank?

6772. No, the Government?—No, I was unaware of it.

6773. That would be a great facility?—Yes, it would be of tremendous help.

6774. **(Mr. Bowring.)** I gathered from what you said in giving the price of land that there is no land in this Province left in the hands of the Government?—I do not think I said that. But I do not think the Government own any good fruit land.

6775. It has all been taken up by private parties or public companies?—Yes.

6776. But that condition does not extend to other States?—I have no knowledge of where the Government land lies in the different Provinces.

6777. But there is a great deal of good land left with the Government for them to hand over to any parties who are willing to go into the fruit farming industry, is there not?—I am not prepared to say that; I have no knowledge.

6778. **(Sir Alfred Bateman.)** You are giving your own experience only?—Yes.

6779. **(Mr. Bowring.)** I wanted to ascertain why this good fruit land was held at such high prices?—Because it is worth it. Large revenues are produced from it, and there is competition from the ostriches and lucerne. They all keep up the price of the land. Then wine farming is a very large industry also. Considerable money is made in it.

6780. Then all the good land in this vicinity at present is being worked?—I would not say that. But either being worked or held by somebody.

6781. It is not in the hands of the Government?—No.

6782. If it were in the hands of the Government at what price would they let it go?—I do not know; but I feel sure there cannot be any in the hands of the Government.

6783. Have any irrigation schemes been carried out by the Government or by the farmers in your vicinity?—Not in my immediate vicinity, but there have been in the Western Province. There are now very extensive irrigation schemes being put through by the Government, and private individuals combining together.

6784. So the fruit farmers are not troubled about the water supply?—Well, there is a great deal of available fruit land where I do not think there is sufficient water. I mean to say there is a lot more land that could be planted if there were more water.

6785. If there were more water you would be able to produce more citrus fruit?—Yes, there is no question.

6786. And there is room for a large increase in that direction?—Yes.

6787. As to the cost of the water under Government schemes, for instance, could you give us some information?—I am afraid not.

6788. Are there any Government experimental farms in operation?—Every Government Agricultural School has an orchard attached to it for experiments. There are quite a few about the Union, and some apart from Government. There is one at Ermelo and some in the Free State.

6789. You think along those lines nothing has been done?—No, but I think they have been starved. I believe one has been closed.

6790. For want of funds?—Yes. I do not think the Government sufficiently appreciate the value of these places.

6791. You consider there is a great value in experimental farms?—Yes.

6792. And more attention should be given to that sort of thing?—Yes.

6793. In regard to your distribution of fruit: has there been any co-operation among you such as there is in California?—Some ten years ago we had what was called a "Fruit Exporters' Union," and we all joined together and had the same agent in London, and we fixed the standard size of boxes and all agreed to use the same size. We standardized the deciduous fruit boxes, but some three or four years ago the Government took things into their own hands and this Union dropped to pieces.

6794. So co-operation hardly exists?—It does not exist in the export trade although it does in the dried fruit trade.

6795. You know how much co-operation has done for the business in California?—Yes.

6796. And how very successful the industry has become since co-operation was introduced, and how very badly off they were in the early days?—Yes, many of us fully realised that.

6797. I suppose you import your box material?—Yes.

6798. From where?—Sweden.

6799. Sprucé fir?—White pine, I think.

6800. I suppose you have all the appliances for attending to your trees so as to keep down pests of all kinds?—Yes, everything quite up-to-date.

6801. Fumigation is necessary, I suppose?—Yes. We have a very able Entomological Department in the Union.

6802. You are not troubled now with pests very much?—We are troubled, but we know how to deal with them.

Mr. Ralph Bulmer, Government Fruit Inspector, called and examined.

6803. **(Sir Alfred Bateman.)** Is there anything you would like to add to Mr. Pickstone's statement, Mr. Bulmer?—Yes, in connection with Mr. Pickstone's remarks just now about the inspection of the stuff and the fruit arriving on the market in bad condition. I inspect the fruit at the docks, and if I find any wrong I report to the grower. You will find in my reports, time after time, that I have written down "too green." This particularly applies to plums and peaches, and I have numbers of letters in my office where the growers have said that they were acting on the instructions received from agents on the other side. I made enquiries into this and I also carried out experiments in cold storage for the Government. Well, it turned out that you can take a peach when it is fully grown but not ripe, and you can keep it and take it out of cold storage. It can be kept for weeks. It will not rot in the same way as a ripe peach—from the outside. It rots from the centre and it lasts for weeks in a perfectly rotten condition. The agent can send it anywhere then and sell it on its outward appearance. I am certain that cannot last. You have either to cater for the consumer or the agent. If the agent cannot sell the stuff at Birmingham, say, he can try Manchester, Liverpool, and so on, whereas if the fruit is ripe it has to be sold almost immediately.

6804. Do you make any reports to Government?—Yes.

6805. Is the report published?—Yes. My last year's report is included in the Agricultural Department Report published last week.

6806. We shall have that?—I presume so. With regard to compulsory inspection; there is a tremendous lot of speculation done in the fruit at present in what I call an undesirable class of fruit. Men go round and buy up cheap fruit and ship this. I have some samples down at the store I could show you that certain men are trying to ship. For instance, some men in the early part of the season were shipping certain plums the Burbank type—which the older shippers do not approve of. They shipped 1,100 boxes and 300 big crates of about 60 lbs. each. I would not pass them. They were speculators and paid the 10*s.* extra freight charged on fruit which has not passed inspection. I saw the men after. They said they knew I would not pass their early plums, but that I would pass their pears. They told me they got 2*s.* 6*d.* a box, which allowed them a profit of 5*d.* a box after paying expenses. Now no grower can possibly grow stuff at 5*d.* And those men were contented.

6807. Then I gather you are in favour of compulsory inspection?—Yes. The quality of some of the stuff they are sending now is disgusting. Since Union the inspection has been permissive only.

6808. **(Sir Rider Haggard.)** Are you satisfied with the cold storage of fruit on shipboard?—I quite agree with Mr. Pickstone that we ought to have ventilated chambers. The chambers we use at the docks have a system of draught going through them, and the air changes every two days, whereas on board ship the air sealed up here is retained till it reaches Southampton. I agree with Mr. Pickstone as to the effect of rain on the peaches. I have made experiments myself.

6809. Do you consider the fruit-growing industry to be in a prosperous condition?—I know a certain man has started shipping from 10 acres of oranges in the Eastern Province two years ago. The trees were Washington Navels, eight years old. He has exported and made a profit of 3,000*l.*, and this year it will be 3,800*l.*

6810. There is a great opening?—Yes

Mr. Laurence Woodhead, called and examined.

(*For the evidence of this witness on "Cotton," see p.* 274.)

6810A. **(Sir Alfred Bateman.)** You have a statement to make as to citrus fruit-growing?—Yes.

The statement is as follows:—

My firm has been shipping oranges grown in the Oliphants River Valley, Clanwilliam district, for the past four or five years with varying success. I may say that the industry is quite in its infancy, and that it has been lying dormant for many years. The Oliphants River Valley, to my mind, is a very rich part indeed and can be developed enormously. The soil is of the best and it is the home of the orange tree. The farmers in the district are now waking up to the fact that there is money in oranges and are planting quantities of Washington Navels. There is a great quantity of ground in the valley unworked, only waiting the necessary energy and capital to utilise it. The growers do the packing themselves and merely utilise my firm as an agency. There has been great difficulty in getting the growers in the past to exercise the necessary thoroughness and attention to detail in the packing. At first the packing was very indifferent, but for the past two seasons this has been improved, and we now have few complaints in regard to packing, and the wastage of fruit in consequence has been brought down almost to a minimum. Oranges exported from this district are mostly seedlings and Washington Navels; the former come from old trees. The fruit is reported from London as being popular and much sought after owing to its golden colour and sweetness.

The oranges are packed in boxes measuring 26 by 12½ by 12½ inches outside measurement, and in the following counts, 96, 112, 126, 115, 176, 200, 226, 252 oranges.

The following are the costs:—

Wrapping paper, 10 by 10 inches, per box 1*d.*
Boxes, 26 by 12½ by 12½ f.o.r. Cape Town, 11*d.*
Railage from Ende Kuil Station per box, about 6*d.*
Freight and f.o.b. charges, 1*s.* 4*d.* per box.
Agency, 2½ per cent.

The price in London averaged about 18*s.* per box for the past two years though the fruit has been sold as low as 12*s.* per box and as high as 32*s.* 6*d.* per box for Washington Navels, this latter price being realised last season. I may say that in the ordinary way the grower would feel satisfied with a return of 3*s.* per hundred on the tree for his fruit. It is obvious, therefore, that the export of oranges, in addition to giving a good return, is also raising the local price of the fruit. Last season my firm shipped over 4,000 boxes from Clanwilliam district; this, of course, is a trifling quantity; this season indications point to some 10,000 boxes being shipped.

As illustrating the profitable nature of orange-growing I may mention that Mr. Roberts of Baddesford Farm, Fort Beaufort, last season exported 1,911 boxes of Washington Navels, grown on 12 acres of land, from trees 7 years old, which realised 1,164*l.* nett, that is, after paying cost of packing, railage *viâ* Cape Town, freight, agency charges, &c. In other words, after taking into account Mr. Roberts's sales locally, he obtained a nett return of 10*s.* per 100 on tree.

6811. You think there is a good prospect as regards oranges?—Yes, very good.

6812. What do you do? Do you act for the growers?—Yes. We ship to London, and get the London reports and assist them as far as possible in the packing and despatch of the fruit.

6813. You make all the arrangements with the shipping company?—Yes.

6814. Are you satisfied with these arrangements?—Yes.

6815. Where do you sell them?—The season before last we sent them to Covent Garden, and last season we sent them through a salesman.

6816. And are the oranges for London consumption?—This salesman distributes them throughout the United Kingdom.

6817. What was the amount of business you did in that way?—We exported last year about 4,000 cases, and we have orders this season for about 10,000 boxes.

6818. What would be the value of about 4,000 boxes?—2,000*l.*—10*s.* a case.

6819. Then it is quite a small industry?—Yes.

6820. **(Mr. Campbell.)** Is that the London value, or is it the value here?—That is the net return to the farmer. If I speak of the value here, I would put it at 5*s.* or 6*s.* In other words, you can go into the districts in the vicinity of Oudtshoorn and buy oranges from the trees at 2*s.* 3*d.* per 100. If the growers get 3*s.* a 100 for their fruit they are quite satisfied. I take a box of oranges as averaging 150. That is 26 inches by 12½ by 12½.

6821. What would that sell for in London?—The prices vary. From 12*s.* up to as much as 30*s.* is being obtained for seedlings.

6822. Would you say the average price would be 18*s.*?—Yes.

6823. For boxes of 150 oranges?—That was the average.

6824. That would be a very superior orange. I presume?—No, it was just the ordinary seedling.

6825. That works out at more than a penny per orange?—Yes, but it depends on the count. The counts run up to from 90 to 220 oranges. I take the average at 150.

6826. That is about a 1¼*d.* each, is it not?—Well, 1½*d.* if it is 18*s.*

6827. This is wholesale; I suppose that orange would be sold retail at 2½*d.* or 2*d.*?—I do not know. I know that the season before last Cape oranges in Regent Street were sold at Brooks's for 2*s.* 6*d.* for five.

6828. But they would not represent the average quality that comes from here?—Yes, from the Clanwilliam district.

6829. You said there is an opening here for a large trade in this description of oranges?—Yes.

6830. You think there it a constant demand for the retail orange at 6*d.* each?—I do not say at 6*d.*; this is quite exceptional.

6831. **(Mr. Lorimer.)** Have you any large fruit farms expressly devoted to fruit, or do your farmers simply grow an acre or two along with other things?—Yes, they are generally mixed farms. They have sowing lands and cattle in addition to the fruit.

6832. How is the fruit worked? By hired labour or by their own families?—By hired labour.

6833. Is it white or coloured?—Coloured.

6834. What wages do they pay?—Between 1*s.* 6*d.* and 2*s.* 6*d.* a day.

6835. In this case production will be comparatively small. Is there no co-operation among the farmers in the way of sending the produce to market, or do they simply send it through a firm like yours?—They send is to us.

6836. And you act as brokers?—Yes.

6837. You credit them with what you get from Covent Garden?—Yes.

6838. You do not buy from them outright, do you?—No.

6839. And are the results to both parties satisfactory?—Yes.

6840. And the quality of the oranges, I gather, appears to be of a kind which is much appreciated in London; is that so?—Yes, that is the report which is received.

6841. Is the amount of land which is devoted to this industry increasing?—It is now.

6842. Is this extension recent?—Yes, within the last three or four years.

6843. Does the fact that you are able to give these people good returns for their produce induce others to come into the business who have not hitherto engaged in it?—No. I would not say so. There is at present a difficulty in getting land.

6844. Does that mean that all the land that is suitable for growing this fruit in your neighbourhood has been already taken up?—Well, it is held by private people. There is little good ground available under the Crown.

6845. Where is this district that you speak of?—It would take you possibly eight hours to get there from Cape Town.

6846. Do you know any other district which is suitable for similar growth within a reasonable radius of Cape Town that is not yet utilised for that purpose?—I think there is a great deal of land about here, and more especially in the Wellington district of Swellendam.

6847. How is that land being utilised now?—Well, it is lying idle, you may say. The farmer may have a very fine orchard, but he pays very little attention to it, because there is little money in it at present on account of his not being in the export trade. He sends his fruit to market and gets very little return, and so he does not bother about it. We are trying to educate him to pay more attention to his orchard and to the export of his fruit.

6848. If you are doing so well, and if you have a practically inexhaustible market in London, why do not you encourage other farmers to go into the same line of business? There is room for extension, you say?—Yes, there is certainly room for it.

6849. And there is plenty of land in the Province which is quite suitable for the purpose?—Yes.

6850. I suppose the farmers who are not now growing fruit do get to know that it is well worth trying?—Yes.

6851. **(Mr. Campbell.)** Do you grow any oranges yourself?—No.

6852. What is the cost of shipping oranges, apart from the cost of the boxes themselves, from the grower to the market per case?—I could calculate it roughly; it would be something between 5*s.* and 6*s.*; that is including the cost of the box.

6853. In shipping the oranges, of course, London is the market principally. On receiving the fruit is it sent on through freight from here to London? Does the shipping company undertake the carriage of them through from Southampton to London?—They deliver at Southampton, I think; I am not certain.

6854. Is there any serious trouble with orange pests in this country?—There is the usual scale. And in the Clanwilliam district where they have a lot of old trees, they are very subject to it, but until recently they did not trouble to spray the trees, and as far as fumigation is concerned that was practically unknown.

6855. And cyaniding?—That was unknown also. In the case of Mr. Roberts's farm, however, they fumigate twice a season. But they do not fumigate in the Clanwilliam district.

6856. We understand, then, from your remarks that orange culture, although it is eminently adapted to South Africa, is in a backward state at the present time?—Yes.

6857. **(Mr. Sinclair.)** Your firm are the shippers for the growers. They employ you and you ship to Covent Garden, I understand?—Yes.

6858. Have you heard any complaints from the growers here about the prices which are realised in London, or have you had occasion to make complaints yourselves as to the handling of the fruit in London?—No.

6859. You have had no ground to complain, I understand?—We find that when the fruit is in good condition we get good prices.

6860. And you get the best price that you can reasonably expect?—Yes.

6861. **(Sir Rider Haggard.)** What is the value of this orange-growing land per acre or per morgen in the Oliphants River valley?—This is rather a difficult question to answer. It is in private hands. Speaking roughly, however, I should say from 5*l.* to 10*l.* per morgen.

6862. This is 2*l.* 10*s.* an acre, let us say?—Yes, it depends, of course. All the land on the farm is not of the same class. You may have 15 or 20 morgen which is good soil and favourably situated in regard to water; and then you may have a lot of land which is not so favourably placed.

6863. Can it be irrigated?—Yes, much of it can be, but there is no necessity to do so.

6864. Is there much of this land to be bought? Supposing, for instance, I wanted to start an orange farm myself, would I have any difficulty in buying say 50 acres of land for the purpose?—They are not always willing to sell the land, but farms do certainly come into the market occasionally. There was a large farm in the market recently.

6865. What did that farm fetch?—It was not sold, because it did not realise the reserve price.

6866. And you do not know, of course, what the reserve was?—This was a very large place, and they wanted something like 10,000*l.* for it, I think.

6867. Would it be suitable for oranges?—Yes, I think so, the greater portion.

6868. Then you think that unlimited land is available for this purpose?—Yes.

6869. And you also consider that there is a great market open?—Yes. The farms are very large indeed and very small portions are cultivated owing to want of capital, want of labour, and want of supervision. The farmer can only supervise a small part of his farm.

6870. How far is this from here?—If you left here at 8 o'clock, you would arrive at Eindekuil at 5 o'clock. And the farms are right down the valley. I have seen 5,000 oranges taken off one tree alone.

6871. What do you think it costs per acre to start a citrus farm?—I am not in a position to say.

6872. **(Sir Jan Langerman.)** What would be the lowest price that would pay a farmer to sell oranges in a London market. Would it be 1*d.* or 2*d.* an orange, or what?—I can buy thousands of oranges for delivery at about the end of May at 2*s.* 3*d.* a hundred on the farm.

6873. Would that pay the farmer well?—Well, he is quite satisfied with that price, and if you take the average of a box of oranges as 3*s.* 6*d.* for 150 you can put the cost of export at 6*s.*, so that would be 9*s.* 6*d.* altogether.

6874. What would it realise in London?—As I said before, we have realised as much as 18*s.* a case, and this is not an outside figure.

6875. But what is the average price?—Well, some boxes would be as low as 12*s.*

6876. Would it not pay the farmer better to ship to England without the assistance of an intermediary? Would he not thereby obtain a better return for his fruit?—Well, naturally we do not encourage it ourselves. He would not obtain a better return.

6877. Well, speaking now about orange-growing, it is possible to grow marketable oranges all through the Union, is it not?—Yes.

6878. In the Transvaal?—Yes, in certain parts of the Transvaal it is.

6879. And Natal produces large quantities of oranges?—Yes.

6880. Cape Colony and the Free State and the Basutoland border?—Yes.

6881. But, practically speaking, the land which is suitable for oranges all over the Union is unlimited?—Yes. Well, there is a very great quantity of it which wants both capital and labour.

6882. **(Mr. Bowring.)** What variety of oranges are those you refer to as being worth 2*s.* 3*d.*?—These are ordinary Cape seedlings.

6883. But they are merchantable and readily sold in the London market?—Yes.

6884. And the better varieties fetch even higher prices?—Washington navels.

6885. What would they fetch?—They always fetch more than seedlings, but the price fluctuates.

6886. If you pay 2*s.* 3*d.* for the ordinary kinds of oranges what would you pay for Washingtons?—About double.

6887. I presume the farmers are going in more and more for the better varieties. Are they not?—Yes.

6888. And I presume that in planting further areas farmers are planting nothing but the finer varieties?—Yes.

6889. The old seedling would not be considered at all?—No.

Cape Town, Tuesday, 3rd March 1914

Mr. JOHN WILLIAM JAGGER, M.L.A., Wholesale Merchant and President of the Cape Town Chamber of Commerce, called and examined.

(*For evidence of this witness on "Land Settlement and Irrigation," on "Steamship, Posts, and Telegraphs," on "Railways," and on "Empire Development," see pp.* 6, 60, 102, *and* 160; *and on "Exhibitions," "Statistics," "General Trade Questions," and "Legislation," see pages* 124, 127, 145, *and* 181 *of* [*Cd.* 7707].)

6890. **(Sir Alfred Bateman.)** Are you in favour of the extension of the principle of inspection of produce?—Not at present. I am not in the trade, but I know one or two large growers. Take, for instance, Mr. Merriman. He is very much opposed to it. He has told me of cases being rejected by the inspector and sent home and then realising very good prices.

6891. Of course, you are aware that in some instances, South African fruit has got a bad name at at Home because it varies so much in condition?—Yes.

6892. It is everything to get a good name for fruit of uniform quality?—Yes. But there is a man here at present from Yorkshire and he is shipping inferior stuff. He says—I am not catering for the West End trade; I am catering for the million, and instead of serving a limited number, I am going to serve the masses of the North, as well as America.

6893. Do you think that is to the advantage of the industry here as a whole?—It provides a market for the inferior fruit. At present that stuff can only be sold to the jam factories. If you had inspection, that stuff would not go. Now this man comes along and puts his money into the concern. He has bought that stuff and he says—I know it is not high-grade fruit, but it will suit the ordinary working-class consumer. It is more by way of an experiment, of course. I should rather like to see how it will work before any steps are taken by the Government in the matter of inspection. It has enormously increased the shipments Home.

6894. **(Mr. Tatlow.)** If grading were made compulsory, I suppose there would be several standards of grading; it would not be all of one high quality for the West End shops?—I should not think so.

6895. If that were the case, then, would it not be well to have a sufficiently low grade for the ordinary shops in ordinary towns and would it not be better on the whole for the reputation of the industry to have compulsory inspection?—It would depend on whether they adopted a low grade. And as we are informed, I do not think they would. They simply want to allow the best stuff only to go Home, and there is no doubt that the growers who go in for the high-class stuff are very keen on this grading, they want to restrict the shipments to this particular class, which would pay very well from their point of view.

6896. Would the Government consider that class of man alone. Would it not consider the benefit of the general grower?—In a country like this, when you appoint an official you have to leave a good bit to him.

6897. **(Sir Alfred Bateman.)** Is it not more a question of the time of picking, the packing and the moisture, and so on, than any particular grade of fruit?—Yes, but they send a lot of low-grade fruit.

Cape Town, 4 and 5 *March*. *Bloemfontein*, 20 *March* 1914.] The Hon. Sir THOMAS WILLIAM SMARTT, K.C.M.G., M.L.A., Mr. F. B. SMITH, Mr. A. E. FICHARDT. [*Natural Resources: Fruit.*

Cape Town, Wednesday, 4th March 1914.

The Hon. Sir THOMAS WILLIAM SMARTT, K.C.M.G., M.L.A., called and examined.

(*For the evidence of this witness on "Land Settlement and Irrigation," "Steamship, Post, and Telegraph Communications," and "Bunker Coal," see pages* 8, 64, *and* 103.)

(Witness.) May I say, in regard to the inspection of fruit, with which I believe the Commission is dealing, that I am one of those who hold the view most strongly that anything that the State can do in the matter of inspection and guaranteeing good quality to the buyer is of great advantage to the country. There is nothing to prevent fruit that does not pass Government inspection being sent to England. But I do think it would be of great benefit to develop the fruit industry of this country, and it would be a pity not to have a Government guarantee of articles of a certain quality. I am in favour of grading of fruit, mealies, and everything like that.

Cape Town, Thursday, 5th March 1914.

Mr. FRANK BRAYBROOKE SMITH, Secretary of the Department of Agriculture for the Union of South Africa, called and examined.

(*For the evidence of this witness on "Land Settlement," "Animal and Agricultural Produce," and "Cotton," see pages* 9, 176, *and* 274.)

6898. **(Chairman.)** What do you say regarding the development of the fruit industry?—Do you mean citrus or deciduous.

6899. I mean both?—As regards citrus fruit, it is undoubtedly a real South African fruit. Wherever you can get sufficient warmth you can cultivate it well.

6900. What does that include?—Oranges, naartjes, and lemons, and in certain places such as the Western Province and some parts of the high veldt deciduous fruit are doing very well. Apples on the high veldt and pears and peaches and plums in the Western Province, but I do not think it will extend over the country to the same extent as citrus fruit.

6901. Is the cultivation of citrus fruit profitable?—Yes.

6902. **(Mr. Campbell.)** The Government grade fruit and give preference of 10*s.* a ton for fruit which has passed the Government inspection by the Government grading expert?—Yes, that is the system.

6903. Does that result in the greater part of the fruit which is exported being graded or is the greater part sent away ungraded?—By far the greater portion is graded. Last year one or two growers did not grade, and this year one or two speculators have sprung up who have bought cheap fruit and shipped it to London with a view to getting the Saturday night trade. They are of opinion that there is a market for cheap fruit in London among the lower classes but at a very different price, of course, to that at which the best fruit is sold in Bond Street.

6904. Would you say that the greater part of the fruit shipped from South Africa is satisfactorily graded?—Yes.

6905. There is no serious complaint?—No.

6906. **(Mr. Tatlow.)** With regard to the grading of fruit, you say the greater part is graded already?—Yes, by far the larger.

6907. That being the case, do you not think it desirable that grading should be made compulsory?—Yes, I do.

6908. So as to prevent the careless man sending out inferior goods?—Yes.

6909. And in the present grading system I suppose there are various classes of fruit?—Yes.

6910. How many grades?—I think there are three grades.

6911. You strongly favour compulsory grading?—Yes.

ORANGE FREE STATE.

Bloemfontein, Friday, 20th March 1914.

Mr. ARTHUR EMMANUEL FICHARDT, President of the Bloemfontein Chamber of Commerce, called and examined.

(*For the evidence of this witness on "Forests," see page* 290.)

6912. **(Sir Jan Langerman.)** What have you to tell us about the fruit prospects in this district?—We ought to be able not only to satisfy our own requirements but also to export.

6912A. Where would you export to?—I do not mean fresh fruit but dried fruit, and if we could induce manufacturers from oversea to open factories here there is no doubt we could export much more.

6913. Could you compete against the coast?—They would export fresh fruit.

6914. And also dried fruit?—Consider the amount of jams that we could export, the amount of fruit that is simply thrown away is enormous.

6915. But are the conditions in the Free State and also in the Transvaal in favour of growing fruit on a large scale. Is it not a fact that you get hail and late frosts in this part of the country?—Of course, the late frost is a danger and hail storms we get occasionally, but we do not have hail storms which are general all over the country, as they, as a rule, are only local.

6916. The late frost would be your greatest enemy?—Yes, but that has been overcome in America by using oil stoves. I have saved a crop of fruit in the old days by having mist fires.

6917. Do you think it would pay to go to that expense?—Well, I read recently that an American farmer had 20,000 oil burners on his farm which were lit by electricity when the temperature fell to a certain point. If it pays them it should pay us.

6918. In regard to the cost of production, would not transport amount to a large item?—There is no doubt that transport is a considerable item, but the imports of motor cars last year were 500,000*l.* and this year over 1,000,000*l.*, and farmers are beginning to use motor cars more and as they do this there is no doubt that the roads will be improved and the farmer will be able to get into town in an hour or so, whereas before it used to take him a whole day, and he will be able to bring his produce in to market or factories, if established, for turning the fruit into jam.

TRANSVAAL.

Pretoria, Monday, 30th March 1914.

Mr. Edmund Francis Bourke, President of the Pretoria Chamber of Commerce, called and examined

(*For the evidence of this witness on "Animal and Agricultural Produce," see p.* 246; *and on "Mining," see p.* 33, *of* [*Cd.* 7707].)

6919 **(Chairman.)** What can you tell us as to the citrus industry?—We can only give the figures in regard to citrus fruit up to 1911. The citrus trees under cultivation were 289,844, but the increase since then has been very great. We have no figures for the past year.

6920. **(Sir Rider Haggard.)** On what area of land are these citrus trees?—I am sorry I cannot give that.

6921. Within what radius?—In the Pretoria and Rustenburg Districts.

6922. Rustenburg is a big place?—Yes, but the district abuts on Pretoria and the trade must automatically come through Pretoria. The development of the citrus fruit industry is growing steadily. The export of oranges to Europe has only just commenced, the trees are just now reaching the bearing stage, and we have immense plantations. Mr. Rissik has a plantation of something like 5,000 trees, Mr. Hollard—just at the back of the Berg—has 5,000, and one grower nearer to Rustenburg has 10,000. Those are one or two producers whose trees will shortly be in bearing and the fruit will shortly be ready for shipment to the European market.

6923. In my days you got frosts, do you still get them?—Yes.

6924. Will the citrus trees stand the frosts?—If care is taken, but in the area that is being most extensively cultivated for the citrus fruit there are comparatively very few frosts, and even where there are frosts we will have to rise to the occasion like they do in Florida, for instance, where they have severe frosts.

6925. You believe your climate is as good as that of Florida?—I think so.

6926. And you can grow very good oranges?—Those we have sent to Europe have been pronounced as second to none.

6927. **(Mr. Bowring.)** At what altitude are your citrus farms in this district?—I think about 4,000 feet in the immediate vicinity of Pretoria. But there are a good many large sheltered positions behind the hills—these ranges of hills that run parallel to the high veldt.

6928. At this altitude have you any considerable frosts in the winter?—Yes, at times, but the frosts are not so severe as to affect the citrus trees, behind the hills especially. There are areas where the frosts are never so severe as in Florida, for example.

6929. In Florida, of course, you may have an occasional frost which is severe, but they are not of frequent occurrence. During your winter, are they not more frequent?—Here they are, but not in the hinterland—not in our immediate vicinity.

6930. Not at an altitude of 4,000 feet?—No. Then there are very large areas growing down in the eastern portion of the Transvaal—the Elands River Valley, an increasing area—and there they have no frosts at all.

6931. What varieties of orange do you grow?—I think one of the principal varieties is Washington Navel—the seedless variety. But others too are grown, such as the Villa Franca and Cecilian Lemon.

6932. All under irrigation?—No, not all; some on dry land.

6933. Even the Washington Navel?—I believe so.

6934. Care is taken against frost, you say. Do you know what process they adopt?—To tell you the truth, I do not think we have suffered so severely. We have suffered, no doubt, here and there, but in most of these areas where the trees are planted, frost is a negligible quantity.

6535. They do not adopt any system of smudging?—No, it is not necessary. We have suffered occasionally. We planted a large area ourselves, for instance, where the frost was severe and we had to pay for our experience, but we did not do it again.

Mr. Izaak Jacob Haarhoff, J.P., called and examined.

(*For the evidence of this witness on "Land Settlement," "Animal and Agricultural Produce," and "Forests," see pp.* 45, 249 *and* 301; *and on "Mining," see p.* 33, *of* [*Cd.* 7707].)

6936. **(Chairman.)** Have you any evidence to give us as to fruit-growing?—I should like to say, first of all, that though a lot has been said about citrus fruit, I am afraid you have not got a thorough idea of what is possible in that direction.

6937. A deputation of the Commission is going out to see the citrus farms?—Well, I should like to give you approximately the area. You can take the Marico district in the Western Transvaal, Rustenburg, Pretoria, Middelburg, Lydenburg, Barberton, and Ermelo. You can reckon the citrus part of the country is roughly 300 miles long by 20 broad. Then we have to the north the Waterburg and Zoutpansburg districts. I was yesterday out in the country, and I saw a citrus farm where I never expected it in the Middelburg district and the farmer told me this, that they have the advantage in that district that the fruit is 20 or 30 days earlier than in the Rustenburg district. Then another thing of which we have a big area in this country is land suitable for apples. You can grow them pretty well anywhere. You can get apples in the Pietersburg district as nice as anywhere on the high veldt or Pretoria, and you can grow almost any variety, and you can buy soil suitable for that kind of produce to-day at an average of about 20*s.* an acre. Apples never have an average value in this country of less than 2*d.* a piece all the year round.

6938. **(Sir Rider Haggard.)** What is citrus fruit soil worth now?—There are any amount of farms which you can buy at 5*l.* an acre under irrigation. The Transvaal has such a variety of climate that you can have your crops spread out in a way which is not possible in many other parts of South Africa. The first peaches we grow are in the market as early as November, and even to-day, at the end of March, you can buy peaches in Pretoria.

Fruit.

Many varieties of fruit are produced in various parts of the country, and there is no district where saleable produce of this character cannot be raised. Prices would be satisfactory if conditions prevailed such as are found in most other countries. In respect of citrus fruits, great progress has been made in the past decade, under the present head of the Transvaal Horticultural Department and his able staff. An export trade, which promises to become a valuable one, has been gradually growing up, and some of the fruit thus exported has realised very satisfactory prices on the London market. Peaches, apricots, nectarines, plums, pears, apples, &c., are readily produced in the high-lying districts, and one instance is recorded in which the price obtained for the produce of an acre of apple trees amounted to a sum of 40*l*. It is perhaps useless for the Transvaal to hope to compete successfully with the Cape in respect of the growing of grapes, or in the production of wines, but the industry is nevertheless a paying one, when conducted under favourable conditions of proximity to markets, &c.

In the Lowveld districts semi-tropical fruits are grown, and these find a ready sale on the Johannesburg and Pretoria markets. Here, however, the Transvaal grower is placed at considerable disadvantage as against the grower in Natal, where the labour of imported Indians can be cheaply obtained.

In De Kaap Valley the climate and soil are admirably suited for the growing of fruit of all kinds, and the quality of the fruit compares very favourably with that which is produced in other parts of the Union. The prices obtained are mainly those which rule the Johannesburg market, to which place the bulk of the fruit is sent, only very small quantities being locally consumed. Small consignments have been exported to Europe, and in some cases they have realised fairly satisfactory prices.

Export to Europe.

It is held that the growing of citrus fruits, and such other varieties as mangoes, avocado pears, bananas, &c., for export to Europe will materially aid in building up an export trade which will be of great value to the district above referred to. As a result of this hope many farmers are busily engaged in planting varieties of fruits which will satisfactorily bear the journey to Europe. There is a great need for the assistance of Government experts, not only as to the methods to be adopted in growing, but to teach the growers how to combat the many diseases to which such fruits are liable. The fruit is of the finest quality wherever the trees are clean and healthy. An expert resident in the district would be of inestimable value to the growers of the areas concerned. Another serious question is that of the cost of boxes for export. I am assured that by the time a box costing 3*d*. at the coast has reached Barberton its value has increased to 7*d*. If this be so, it will be readily seen how such a policy must injure the prospects of industrious growers. Tomatoes are largely grown in many parts of the Transvaal, and there are growers who send no less than 100 tons to the Johannesburg market in a single season. Competition, however, is very keen, and one grower states that his average profit on a box of 40 lbs. weight has been only 1*s*. during the past season. Out of such prices he has to pay the costs of cultivation, fertilisers, boxes, paper, packing, and transport to a station 15 miles distant from his farm. No wonder that he remarks, "This is not a very highly fattening process."

Railway Rates.

We have a statement from a grower of grapes, in which he says that for eight boxes of grapes, weighing 200 lbs., he secured on the Johannesburg market the sum of 11*s*. 6*d*. His charges were: railage, 5*s*. 10*d*.; boxes, 3*s*. 8*d*.; commission, 1*s*.; leaving him a surplus of 1*s*. on his consignment. It will be noticed that the railway took some 52 per cent. of the gross value of the consignment for freightage. No wonder that the the writer remarks that "this is encouraging business with a vengeance."

It is absolutely necessary that, in connection with the export of fruit to the London market, some arrangement should be made whereby the fruit is disposed of through reliable agents, as we are informed by eye-witnesses that much of it is sacrificed at ridiculous prices simply for lack of proper handling before and at the time of sale.

Provision should also be made whereby any statement made on invoice, advertisement or circular, relating to the quality of seeds or manures, should be an absolute guarantee as between buyer and seller as to the facts stated.

We are also informed that the damage which is sustained by careless packing and handling of perishables in the process of transport by rail is a cause of very serious loss to growers. To claim for losses thus sustained usually amounts to the receipt of a letter from the department concerned, in which it is stated that "ordinary care was taken in the conveyance of "the consignment, and your claim cannot, therefore, "be recognised."

APPENDIX II.

Extract from Statement of the South African National Union, handed in at Johannesburg.

(For portion of this Statement relating to "Animal and Agricultural Produce," General, see p. 269.)

Fruit-growing.—Although fruit has been grown in South Africa for a considerable time, it is only in the last fifteen years or so that the possibilities of building up an export business has been fully realised. A regular export trade in grapes, peaches, pears, plums, apricots, nectarines, oranges, and naartjes has now become an accomplished fact, and growers have realised that the prices to be obtained well repay the care involved in systematic and intelligent gathering, and packing for both the oversea and local markets.

Deciduous fruits grow well in many parts of the Union. The varieties best suited to the different

districts are now known, and with ordinary care and judgment, excellent crops can be assured in those parts which have been recognised as suitable. Up to the present the best quality of fruit has been sent oversea. There is a very large local demand which is satisfied, as a rule, by a second, although not an indifferent, quality.

Although considerable quantities of deciduous fruits are grown every year, the industry is still in its infancy, for the production of *dried* fruits, including prunes and raisins, has not received the attention it merits. Consignments sent to London have been pronounced of excellent quality, but no regular export trade has yet been established in these lines, nor has the local demand been overtaken. Nearly 4½ million pounds of dried and canned fruit were imported into South Africa during 1913.

The world's demand for good fruit is increasing every year. South Africa should be able to supply a large portion of the European demand for fresh and dried fruit, as well as the local demand, which will steadily increase as the interior is opened up. In Northern Rhodesia, the Congo, and Central Africa there will always be a big market for South African dried fruit. As the most up-to-date methods of canning and packing are more widely adopted the internal demand for preserved fruits will largely increase.

In citrus-growing also South Africa possesses an asset the real value of which is not yet grasped. Many districts have been proved to be eminently suitable for the production of citrus fruits. A trade has been opened up and the possibilities of the oversea market tested. South African oranges have obtained a place on the markets of Europe from which, owing to their excellent flavour and especially the time of the year at which the fruit arrives, they are not likely to be displaced. Moreover, citrus fruit produced in the dry atmosphere of the Transvaal carries well over the 7,000 miles that separate the grower from the oversea consumer.

The profits to be derived from orange-growing are very considerable. Mr. Davis, the Government horticulturist, recently instanced cases in which 35*s.* was being made annually from orange trees and 60*s.* from naartje trees five years old. The Washington Navel orange is the variety most in favour.

Citrus land is rapidly rising in value all over South Africa, but it is still to be had at low prices compared with those prevailing in California and Florida. As irrigation schemes are carried out more extensively, additional areas will become available. There is no pleasanter or more profitable proposition than citrus-growing, nor one more suited to the small farmer or the large company who have other sources of revenue while the trees are coming into bearing. In the Transvaal citrus growing and tobacco are often carried on together, the same climatic conditions being favourable to both. Tobacco is a profitable crop at present, but it is expected that the supply will soon overtake the local demand, when oversea markets will have to be sought. But there will always be a considerable market in South Africa for the best qualities of leaf.

Owing to the wide variety of climate in South Africa almost any kind of fruit can be grown. From bananas, pine-apples, mangoes, and citrus fruits in the semi-tropical areas to apples on the high veld of the Free State or Transvaal, there is a very wide range of choice. The low veld of the Transvaal with its extraordinary fertility and depth of soil has marvellous possibilities in fruit production exceeded in no other part of the world.

In the apple-growing sections of Canada and the United States a lucrative proposition is found in the purchasing of large tracts of land and their subdivision into smaller plots suitable for orchards. These are planted and cared for by the vendors until such time as the trees come into bearing. The purchase is usually arranged on the instalment system, so that the proprietor of a 20-acre plot, on assuming charge of it when the bearing period arrives, is in a position not only to discharge the remainder of his liabilities within four or five years, but also to live in comfort during that period from the produce of his trees.

In British Columbia such ready-made orchards have realised from 80*l.* to 250*l.* per acre. In South Africa it would be possible to offer such propositions to would-be settlers at from 20*l.* to 50*l.* per acre.

In the Western Province of the Cape there has been a great appreciation of the value of land for the production of deciduous fruit, but ground can still be obtained on reasonable terms.

An enormous impetus would be given to the fruit industry in South Africa if a large acreage, in small farms, was available for purchase on extended terms of payment, such as those under which Crown lands are offered, *i.e.*, five years' lease at a nominal rate, with the option of subsequent purchase in annual instalments. These terms would attract large numbers of people with limited capital, which under such an arrangement could be devoted entirely to development. The present system of land sales is largely prohibitive, for a buyer is compelled not only to pay down more money than he can afford, but also to take hundreds of acres he does not require. If land was offered in holdings of a reasonable size much higher prices than at present obtain could be profitably paid.

Strange to say, the possibilities of profit in buying the best agricultural land and cutting it up as suggested have never been fully realised in South Africa. It is considered that in this direction there is a very large opening for the employment of British capital.

APPENDIX III.

MEMORANDUM by Mr. W. B. BRIGHT, Joint Manager for the Rustenburg Citrus Growers, Limited, on the TRANSVAAL CITRUS INDUSTRY.

In the Transvaal oranges have been grown in all districts in the latitude of Pretoria and northwards.

The most notable has been the Rustenburg district, but the planting of orchards is going on rapidly in all suitable districts adjacent to the railway. We may say that every extension of line in the northern half of the Transvaal opens up more citrus land.

Confining our remarks to the Rustenburg district, the citrus belt is a strip of ground 4,000 to 4,500 feet above sea level, lying on the north side of Magaliesburg range, which protects it from the cold south winds in the winter.

The soil is sandy loam, often 20 feet deep, formed by the denudation of the quartzite hills.

The controlling factor in the size of the orchards is the amount of irrigating water available. All the smaller streams are fully used at present, but in future further land may be brought under irrigation by erecting storage works on the larger rivers.

There will remain large tracts of ground for which no water is available.

The climate is excellent for the cultivation of citrus fruits, the rains coming in the summer (average rainfall about 25 inches), while the harvest season, the winter months, June, July, and August, are dry.

A few degrees of frost only are experienced on the lower lying portions of the groves, and the continuous line of hills gives protection from cold south winds.

When the voortrekkers first settled in the district they planted seedling orange trees, and these are now grown to great size, often 60 feet in height, and bear enormous crops of excellent fruit.

This is the fruit that has been exported during the last few years. Many different types of oranges are produced by these trees, and owing to the size of the trees the method of hand-picking cannot be carried out. In order to pack the fruit for export a co-operative society was formed in Rustenburg, to which town

the farmers cart their fruit in springless ox-wagons, and it is there graded, packed, and despatched to Europe *viâ* Cape Town.

Considering the rough handling the fruit must undergo it is surprising the wastage has been so small. The dry climate produces good keeping qualities. This fruit has realised from 12*s.* to 1*l.* per case at Covent Garden.

Since the war a great amount of planting has taken place, the majority of the trees put out being the "Washington navel," which in California has proved itself to be the best selling orange grown.

These newer orchards are only just beginning to produce fruit, and the Johannesburg market has readily taken all the navel oranges sent to it.

Small experimental shipments have been made to London with excellent results, 15*s.* to 25*s.* per case being obtained.

The quantity of fruit exported will advance rapidly, as many thousands of young trees will each year now augment the producing orchards. This class of fruit will be hand-picked and packed in the orchards.

Our picking season begins in June and continues to August with Navels, while Valentia Lates carry it on into December.

Since the war considerable numbers of lemons of the "Villa Franca," "Genoa," and "Lisbon" types have been planted and thrive splendidly, young trees often bearing a considerable crop in the third season. These are all sold in the uncured state on the local markets, realising from 5*s.* to 8*s.* per case of 100 fruits. This price is obtained in competition with the considerable quantity of lemons still imported from the Mediterranean.

No systematic "curing" of lemons has yet been attempted. In considering the possibilities of exporting lemons we must bear in mind that the lemon crop is being gathered all the year round, and therefore we should always have the Mediterranean fruit competing with us.

With oranges our harvest comes just at that time when all other orange-exporting countries have finished theirs.

Cost of Land.

Irrigated, unplanted citrus land in this district now sells at from 25*l.* to 50*l.* per acre, and very little is available even at that price.

Little accurate information is yet available as to the cost of cultivating commercial orchards, an important factor of which is the amount of fertilisation that is done.

Our labour is of the poorest description. All heavy manual labour is done by Kaffirs, who come from their kraals to work for periods of a few months and then go back again. The only way to induce them to remain for longer periods is to give them portions of land for their own use.

In large orchards the workers are continually changing.

There are large numbers of very poor whites in the district, and it is to be hoped that the women and girls will take up the wrapping and packing of fruit. Their lives are now spent in idleness, so that a settled industrious character can only be gradually evolved.

Kaffirs are being paid 2*l.* per month and their food, the latter costing from 10*s.* to 12*s.* per month. The natives are only engaged on monthly contracts.

White farm hands are paid from 5*l.* to 6*l.* per month, without food, but more often share in the crop.

As the neighbourhood is a deadly one for horses most of the ploughing is done with oxen. These are most unsuitable for orchard work, and all farmers are looking forward to the time when the scourge of horse-sickness is overcome.

The development of light agricultural motor tractors may overcome the difficulty.

In regard to transport, all the orchards suffer because of the great distance the railway has been built from the citrus lands.

The orange groves nestle closely against the hills, but the railway was laid out in the plain, 5 to 10 miles from the hills, and passes through uncultivated clay ground.

The fruit for export is carried to Cape Town at a rate of 15*s.* per ton. It is there inspected by a Government inspector, the charge being 1*s.* 6*d.* per ton.

The dock charges are 2*s.* per ton, and sea freight to London 25*s.* per ton.

The experience gained by the co-operative society shows that after the fruit reaches the packing shed it can be graded, boxed, and transported, and sold on the London market at an inclusive cost of 5*s.* 6*d.* per standard box (averaging 176 fruits).

Of this charge the wrapping and boxing costs 1*s.* 9*d.*, and the balance of 3*s.* 9*d.* is absorbed by the freight, dock charges, commission, &c.

The wood used for the boxes is imported, as no suitable timber is grown in the country.

The duty and railage on this material makes a standard box cost 1*s.* 3*d.* at Rustenburg.

W. B. BRIGHT,
Joint Manager for the
Rustenburg Citrus Growers, Limited.

(f) Fisheries.

NATAL.

Durban, Wednesday, 25th March 1914.

Mr. JACOB J. EGELAND, Managing Director of the Union Whaling Company, and Mr. F. BEARPARK, called and examined.

6939. **(Sir Alfred Bateman.)** Whom do you represent, Mr. Egeland?—**(Mr. Egeland.)** I am managing director of the Union Whaling Company.

The following statement was submitted by Mr. Egeland:—

THE WHALING INDUSTRY.

Industry started at Durban.—Durban is the cradle of the whaling industry in South Africa (according to Norwegian methods).

First Campaign Site.—In 1908 the first South African whaling station was built at the Bluff side of the entrance to Durban. The following year it was removed to the ocean side of the Bluff.

Present Companies in Natal.—To-day we have six whaling stations in Natal, five at the Bluff, and one at Park Rynie.

South African Whaling Company, Ltd.,	started	1908
Union Whaling and Fish Company	,,	1910
Premier Whaling Company	,,	1912
Shepstone ,,	,,	1912
Consolidated ,,	,,	1913
Park Rynie ,,	,,	1911

Capital expenditure over quarter million sterling.

Dividends.—Only two of these companies have paid any dividends.

Number of Whalers.—Altogether about 25 whaling steamers are employed in Natal. Average cost about 5,000*l.* Six were built in England, the rest in Norway.

Where Boilers purchased.—Most of the blubber and press boilers were constructed in Natal.

Equipments from Norway.—Harpoons and whalelines are imported from Norway; also most of the powder.

High Customs Duty on Gear.—Being for industrial purposes the Customs duty (15 per cent.—gunpowder, 6*d.* per lb.) seems unreasonably high.

Railway rate on Carcasses.—The South African railways charge 4*l.* per whale for carting the carcasses to the Bluff station. Also unreasonably high.

Licences, &c.—Moreover, each company pays annually to the Provincial Government 50*l.*, and 5*l.* for each whaler.

Revenue.—Further, the Union derives revenue from leases of land, craft licences and dock fees, trading licences, &c. (Company licence, 1*l.* per thousand capital).

Industry heavily taxed.—No other industry contributes so much to the revenue of this country—in proportion to its extent.

Water.—The Durban Corporation also derive large amounts annually from the whaling stations for supply of water.

Expensive.—Whaling in Durban is very expensive.

High cost of Shipping.—The cost of shipping oil to Europe (including packing) is about 5*l.* per ton.

Cost of Living.—The high cost of living in Natal also mitigates against the success of the local industry.

Freight.—Last year the shipping companies raised the freight of oil to 1*l.* 4*s.* 9*d.* per ton. In their own interest they ought to go back to the previous rate of 20*s.* per ton freight.

Harpoons and whalelines, also gunpowder, should, in my opinion, be free of duty, and the railage on whale carcasses reduced to 2*l.* per whale.

There are two families of whales:—

(1) *Odontoceti*, with teeth. Sperm, bottlenose (dolphins and porpoises).

(2) *Mystacoceti* (Baleen whales):
The Arctic Right whales.
Southern Right ,, (*C. Australis.*)
Blue ,,
Humpbacked ,, (*Magoptera boap.*)
Fin ,,
Common Rorquals (Herring whale).

With the exception of the Arctic Right whale, all the other species obtain in these waters.

Sperm.—The Sperm whales are here throughout the year, though seldom seen within 50 miles of the coast; running mostly in schools, too, and rarely staying more than a day or two in the same vicinity. The Sperm whales are difficult to find, but when found there are generally thousands in the school. Most of them are small, and as the price of sperm oil has dropped about 50 per cent. within the last three years, Sperm whaling from a shore station is hardly in itself a paying proposition.

Some 250 Sperm whales were captured here last year.

Season.—The Baleen whales (or whalebone whales begin to arrive in the month of May, migrating northwards. In August–September they begin to return southward. After the end of November and until April–May hardly one Baleen whale has been seen off the Natal coast.

Antarctic Season.—At this time, November–April, thousands are killed annually at the Falkland Islands (British).

Whaling deplorably overdone.—At whaling fields, like those of South Georgia and South Shetland, where whales remain stationary several months, there is room for more companies than at places like the South African coast where the whales do *not* stop, but merely *migrate* all the time.

Very rarely are many Baleen whales seen off the Natal coast in any one day.

It is, therefore, deplorable that more than one—or at most two—stations should have been allowed in any one port.

At Durban, for instance, there is not room for more than two companies.

Life of Industry.—If the industry had been limited to, say, six companies on the East Coast of Africa and a similar number on the West Coast, each company might have done well, and the life of the industry been prolonged indefinitely.

Number of Companies.—Upwards of 30 whaling companies operated in Africa last year.

1913 *Catches.*—In 1913, the six Natal companies, with 25 whalers, captured 1,247 whales, averaging about 50 whales per boat.

In 1911, the then existing two Durban companies, with seven whalers, captured about 1,000, average about 140 per boat.

Humpbacks.—Last year, about 650 Humpbacked whales were captured, as against about 950 in 1911.

Fin and Blue Whales.—About 250 Fin whales and 50 Blue whales were captured in 1913.

Output.—The following products were obtained in 1913:—

About 7,985 tons oil.
,, 3,888 ,, fertilizers.
,, 53 ,, finners.
,, 14 cwt. whalebone. (*e. Australis.*)

Value.—I estimate the local value of last year products at about 140,000*l.*

Over 5,000 whales have been landed at Durban altogether.

Protection of Industry.—In my opinion it is now too late for the Union Government to do anything for the protection of the industry (except by reducing railage, duty, and licences).

Already too many companies have been allowed. No more are likely to come here.

Japanese Ordinance.—But in any new fields the authorities would be well advised in confining the industry within reasonable limits, in order to preserve it—on lines similar to the Japanese Ordinance on whaling.

Extinction of Whales.—A movement has been on foot in France and also in America for the preservation of whales, and fears have been expressed that the whales or some of the species may become extinct. Consequently, an international agreement to stop the killing of whales has been suggested. In my opinion, such a step is as unnecessary as it would be impracticable

Whales cannot be exterminated.—It is impossible to exterminate the whales. There are probably more whales in the sea to-day than ever before. The thing will regulate itself. When in a whaling field the number of whales decrease so that the industry is no longer payable, whaling there will necessarily cease in that particular field.

Millions of Whales.—There are, and will always be, millions of whales in the seas.

But to preserve the industry, Governments might, jointly or separately, insist that—

(1) No whales under a certain size shall be killed—say 25 feet for Baleen whales;

(2) That the whole whale carcase shall be used up—not only the blubber, but also the flesh and bones.

Market.—Most of the whale oil and nearly all the sperm oil has been exported to Europe. The bulk has gone to Glasgow, some to the Continent, and a little to Australia.

The local demand for whale oil is increasing. About one-half of last year's Natal production was disposed of for home consumption.

Most of the fertilizers have been consumed in South Africa. Some have been exported to Mauritius.

Whalebone, whale finners, and sperm tusks find no market in this country. France has taken the bulk of the whalebone and finners.

6940. **(Sir Alfred Bateman.)** Whom do you represent, Mr. Bearpark?—**(Mr. Bearpark.)** I represent myself, as one who is very keenly interested in the whaling industry. I am manager of a whaling company at the present time.

The witness submitted the following statement :—

THE WHALING INDUSTRY.

I SPEAK of this as a world-wide industry.

With the object of drawing attention of the Commission to the conservation of the natural resource on which this industry depends for the supply of its "raw material"; and to the probable advisability of so controlling the industry by regulations whereby the maximum benefit shall be obtained from the whales captured, I beg to submit the following observations.

The whaling industry is to-day carried on all over the world in an uneconomical, wasteful manner, and with no thought for the future. Such methods will probably result in the automatic extinction of the industry.

The industry could be established on a comparatively firm and sound basis by regulations and investigations providing for, *inter alia* :—

1. Protection of the cow whale during the breeding season.
2. Protection of the cow whale during the period immediately after the birth of the calf.
3. Prohibition of the capture of immature whales.
4. Limitation of the number of whale-catching boats operating in a particular locality.
5. Regulations requiring that all whaling factories shall be equipped in such a manner that every whale captured shall be expeditiously dealt with, and that every portion of the whale shall be worked up into an economically useful material without any waste.
6. A searching investigation into the manner in which the industry is at present prosecuted, together with the compilation of statistics embracing, among other things, the following information :—

   (*a*) Number of whales caught.
   (*b*) Species of whales caught.
   (*c*) Species caught at certain periods.
   (*d*) Sizes of all whales caught, giving dates.
   (*e*) Period of the year during which whaling is carried on.
   (*f*) Number of pregnant whales caught, giving dates.
   (*g*) Number of cows caught which were accompanied by calves, giving dates.
   (*h*) Number of whale-catching boats operating, with description.
   (*i*) Factory equipment, showing number of meat and bone digesters, blubber boilers, secondary blubbber boilers, fertiliser drying and grinding plant, size of steaam boilers, &c., &c.
   (*j*) Number of employees at factory.
   (*k*) Value of oil, fertilisers, finners, whalebone, ambergris, &c. produced.
   (*l*) Weight of ditto, ditto, ditto.

Whales are migratory mammals, and it would, therefore, be useless to enforce such regulations as the above in any particular locality.

The regulations should be international, embracing every sea, and all territorial waters.

The whaling industry is carried on in Natal.

I submit this industry has to bear exceedingly heavy charges imposed by the Government. The Government of South Africa probably derives more income from this industry, with a minimum amount of trouble, than is the case with any other industry of similar magnitude in the country.

The charges are as follows :—

The Durban whaling companies lease the land for their factories from the Government at a very high rental. They also pay rent for their railway sidings, slipways whereon the whales are landed, and for their powder magazines.

The Durban companies pay the following licence fees :—

	£	*s.*	*d.*
Licence for whaling - - -	50	0	0
,, ,, trading - - -	50	0	0
,, ,, each boat - - -	5	0	0
,, ,, factory - - -	1	0	0
,, ,, each harpoon gun -	0	10	0
,, ,, magazine - - -	5	0	0

They pay a very high rate for the transport of the whales to the factory, viz. : —

	£	*s.*	*d.*
Landing charge - - - -	1	10	0
Wharfage - - - - -	0	10	0
Railage - - - - - -	4	0	0

Total per whale. 6*l.*

The railage is a very heavy item; the distance between the place where the whales are landed and the factories averages about 1½ miles.

In addition to the above the Government derives considerable revenue from the transport of coal, stores, &c., to the boats and factories, floating dock charges, harbour and light dues.

The import duty of 15 per cent. on whaling gear is a heavy duty, because the gear is used for purely industrial purposes. Such gear is not obtainable from the United Kingdom.

In view of the charges enumerated above, and of the high cost of commodities in general, living, &c., I submit that the whaling companies operating from Natal do so at a great disadvantage when compared with whaling companies operating in other parts of the world.

There is about 300,000*l.* invested in the whaling industry of Natal.

There are six companies operating from Natal, five from Durban, and one on the south coast, about 30 miles from Durban.

The industry was established in 1908, and the following figures show the growth of the business :—

Year.	Number of Whales.	Number of Boats.
1908 - - - -	106	2
1909 - - - -	155	2
1910 - - - -	532	5
1911 - - - -	1,061	9
1912 - - - -	1,006	18
1913 - - - -	1,256	22

From 1908 to 1912 inclusive, the majority of the whales captured belong to the humpback species. During the year 1913 many sperm, finner, and blue whales were caught, and there was a corresponding decrease in the number of humpback whales caught.

The value of the products for the 1913 season was about 150,000*l.*

The Natal whaling industry was inaugurated by a Norwegian company, but the majority of the companies are now carried on on British capital.

6941. **(Sir Alfred Bateman.)** You give rather a bad account of the industry, because you say that only two companies have paid dividends up to the present time?—**(Mr. Egeland.)** Yes, and only one paid a dividend last year.

6942. What percentage?—Last year, one company paid 20 per cent., but the others none at all.

6943. You do not think an international agreement would do much good?—I think not. I think it would be very difficult to bring it about, and I do not see what good it could do.

6944. Why is that?—What would be the object?

6945. I was rather thinking of the Convention about fur seals, and against killing seals at certain times, and so on, on the lines of regulation and restriction; you do not think that would be possible in whaling to-day?—I hardly think so. I do not see how it is practicable in whaling.

6946. Mr. Bearpark, I gather you are of the contrary opinion?—**(Mr. Bearpark.)** I am. I think regulation of the industry would be to the benefit of all the people engaged in the industry to-day.

6947. That would have to be an international agreement, would it not?—Yes, undoubtedly. It would be useless to frame regulations for one part of the sea, whereas different regulations might obtain in another part.

6948. The whale is a great traveller?—Yes. In most places where they are caught, the whales are migrating. In some few places the whales remain for months, but the general rule is that they are migrating when they are caught. **(Mr. Egeland.)** I think the Baleen whales do not remain stationary in one place throughout the year. I think they change their habits. I think the Baleen whales that we have from May to November leave us in November and go to the Antarctic for the summer, and return in May.

6949. Do they keep south of the line?—Yes, they keep in the Southern Hemisphere.

6950. They are not the whale of North America?—No, although they have the same species there also.

6951. I suppose it has never been possible to mark a whale in any way?—It would be very difficult. I think it is quite likely that some of the whales we get here come from the Falkland Islands, because we have had wounded whales here which were probably wounded by whaling companies operating there.

6952. But the gist of the thing is that there are too many companies to-day, is it not?—Yes. That is the great mistake that has been made here.

6953. Would not that cure itself—will not some of the companies go out?—They will. That will be inevitable, but I think it is a great pity, because a lot of money will be wasted.

6954. And the industry is becoming very expensive?—It always was expensive, especially here in this country.

6955. Why is it expensive here to-day?—In the first place, the Government tax is a very severe burden, and the duties also.

6956. You mean 15 per cent. on various materials?—Yes. I think all whaling gear, and the special gunpowder used for killing whales, should be duty free, being for industrial purposes.

6957. We have nothing to do with the duties, but have you made any representations about it?—I think we have.

6958. Is there any other reason why whaling should be expensive here?—Well, the cost of living is rather high in this country compared to other whaling fields, and, of course, we have to feed our men. It costs 4*l.* or 5*l.* per month. **(Mr. Bearpark.)** The men engaged in whaling here obtain more money than in other parts of the world. There was a strike among the whalers, and they demanded practically South African rates of pay although these men do not live in this country. They come out under a contract and are fed by the companies and repatriated at the end of their contracts. Therefore, there is no necessity for them to spend any money here. They live on the boats and at the stations, so they do not live in the country in the true sense of the word.

6959. But they come under the influence of the high wages?—Yes, and they had a strike, and to-day they are getting what practically amounts to the South African rate of wages, which is considerably higher than whalers get in other parts of the world.

6960. It is a rather hazardous life, is it not?—No, there is no more hazard, I think, about the life than any other. There has only been one man drowned since whaling commenced in Durban.

6961. How long ago is that?—About six years ago. **(Mr. Egeland.)** And that was not due to the whaling work. He fell overboard in the harbour. With the Norwegian methods, there is really very little danger. **(Mr. Bearpark.)** Whaling to-day is carried out by powerful modern steamers and not from the small harpoon boats that we read about in the novel.

6962. **(Mr. Bowring.)** Prior to the advent of the steamers, what was done with the whaling industry?—**(Mr. Egeland.)** Practically nothing. Occasionally a sperm whale or a right whale might be found near Port Elizabeth and cut up in a very primitive fashion and used up there, but there was no whaling, properly speaking, before 1908.

6963. There were no whaling stations or whaling boats fitted out for the purpose?—No.

6964. So the advent of the steamers was the commencement of whaling in South Africa?—Yes. **(Mr. Bearpark.)** Steamers had been operating in other parts of the world before they came here. **(Mr. Egeland.)** In 1907 the Natal Government granted a lease of land at the Bluff, and I proceeded to Norway and formed the first whaling company. They brought out the first two steamers. That company was successful, so also was the second company—the Union, and now it has been overdone.

6965. How many whales were caught the first year by those two boats?—Not many. They started late in the season, but the company paid a dividend of 25 per cent.

6966. And the second year?—Seven per cent.

6967. How many boats worked that year?—The same company and the same number.

6968. But there were other competing companies?—No, not that year. **(Mr. Bearpark.)** In 1908 two boats caught 106 whales, that was the first year.

6969. And then they paid 25 per cent.?—Yes, and the second year the same two boats working caught 155 whales.

6970. And why did they only pay seven per cent.?—I could not tell you.

6971. You do not know what was the cause of that wonderful drop?—No. **(Mr. Egeland.)** In the following year they did better, considerably better in 1911.

6972. But with the incoming of more boats, the numbers of whales per boat have been decreasing?—Yes. In 1911 we had an average of 140 per boat, and last year an average of fifty. Seven whalers in 1911 caught 1,000 whales as against 25 which caught 1,247 last year, an average of 50 per boat last year as against 140, or approximately so, in 1911.

6973. And of all the companies only one paid a dividend?—Yes. Last year.

6974. And that was 20 per cent.?—Yes.

6975. Why should there be such a wide difference?—I suppose there is such a thing as luck. I happen to be managing director of that company, so I do not care to say. In 1911, we paid a much larger dividend than that, over 100 per cent., but that was an extraordinarily good year.

6976. You struck a good many sperm whales that year?—No, not one. But we struck oil. The market was good.

6977. You had the same boats?—We had three in 1911.

6978. In regard to these boats, they are mostly built in Norway, I suppose?—Yes.

6979. And you get all your gear from Norway?—Yes.

6980. Are they allowed in duty-free here?—No, 15 per cent. is charged on whaling gear. There is no duty on boats.

6981. The gear which is brought in with the boat, does that pay 15 per cent.?—Yes.

6982. When the boat first comes with full equipment?—I think that comes with the boat, and is overlooked, but if you import, as we have to do annually, a number of lines and harpoons, we have to pay duty on those.

6983. When the boat comes with full equipment it comes duty free?—Yes. **(Mr. Bearpark.)** I have paid duty on the equipment of a new boat.

6984. But surely there must be one rule for both. They cannot collect it from you?—I thiuk the fact is that the Customs did not realise that the gear was coming in the whaling boats. It was something quite new to them. They evideutly did not know the boats were bringing gear.

6985. Probably the first year you came in duty free, and later on they imposed duty?—Yes.

6986. In any case the boats are free?—Yes. **(Mr. Egeland.)** All ships are duty free.

6987. You refer to the licence fees being very heavy. Now, do you know what is paid in other parts of the world for a whaling licence?—I know some of them.

6988. Are they really lower than what you are paying?—I think so. In some places they have hardly any charges, I think.

6989. In Norway they are heavy?—There is no whaling done in Norway to-day.

6990. It has died out altogether?—Yes, it is finished.

6991. Because I know in my part of the world—Newfoundland—they started with a whaling licence of 300*l.*?—Yes, but they did the right thing there. They insisted that whaling stations should be a certain distance apart. They were quite justified in doing that, and the company could afford to pay that licence.

6992. That is the very thing I was going to ask you. Is there no regulation here about the distance between factories?—No. We made representations to the Government suggesting that they should adopt certain regulations to protect the industry on the basis of the Newfoundland regulations, and the Japanese ordinance, of which I had a copy and sent it to the Government. It is a very good ordinance.

6993. **(Mr. Bowring.)** You can, perhaps, tell us roughly what it is?—All applications for licences have to be sent in to the Department of Agriculture, I think, and in the application all particulars must be given as to the ships, the methods, and the places where they intend to operate, and it is then for the Department to refuse or grant the application for a licence as it thinks fit. If there is room for another licence at that place it will probably be granted, but if they think there is no room it will be refused. And that is a provision that struck me as being a very good thing, and another excellent provision was that within the whaling fields of Korea and Japan the maximum number of whalers was fixed and limited to 30, and on no account would more whalers be allowed there beyond that number.

6994. Each company was given a special area?—Yes.

6995. And you think that those restrictions should be carried out in this country?—Well, I think it is now a case of closing the door after the steed is out. I think the Government has gone too far here to give away rights which they cannot withdraw, and I do not think the Government can assist us now in any way. But in regard to the opening of any new whaling field, I think they would be well advised in providing against the overdoing of the industry and restricting it and keeping it in reasonable limits.

6996. In this country the reduction of the number could not be managed without fair compensation, I suppose, being paid to those companies which were dispossessed?—Yes.

6997. Are there any other points they could go to? Any new areas?—In South Africa, *i.e.*, south of the line, we had last year about 30 companies on the west and east coasts, whereas I hold there should not have been more than 12. Half-a-dozen on each side would be ample, because here you are simply dealing with migratory whales.

6998. Do not they come at certain seasons and stay over a period?—No, they migrate. Some are here to-day and others to-morrow. They come in driblets. If they all came on the same day we should not be able to do any business at all. But the number of whales that frequent these waters is not sufficient to justify the large number of companies which are allowed in any one port. I do not think there should have been more than one or at most two companies in any one port.

6999. Are there no special feeding grounds around here?—No, of course, they follow their food in the currents. There is food, but they do not stop. They are constantly migrating up the coast and down.

7000. You do not know where they go?—Not exactly.

7001. How far south and north, for instance?—It is quite likely that some go as far as Whaling Bay in the Antarctic, where Amundsen and Scott have been. They saw an enormous number of whales. But we are fairly entitled to presume that many go across to South America and the Falkland Islands and return again in the proper season.

7002. You get a fair number of right whales, do you not?—Very few—about two or three a year.

7003. The right whales surely do not go north of this?—No, I do not think they go much further than this.

7004. Because I understand the right whale is one that likes to be in very cold water?—Yes. Some of the hump-back whales seem to go right across the line, though many of them do not go so far. **(Mr. Bearpark.)** The season here is from May to November and the Falkland Islands season is from November to April, so that is presumptive evidence that possibly the whales are travelling between these points.

7005. You get the same kind of whales as they do?—Exactly, the hump-backed whale particularly. **(Mr. Egeland.)** I have heard from master mariners coming from South America in May or June say they have passed a large quantity of whales coming this way—making for South Africa, and that seems to support my theory.

7006. Do you find the whales are fatter at certain seasons than others?—When they come from the Antarctic they are fatter—that is early in the season.

7007. And on returning they are lean?—Yes.

7008. What quantity of bone do you get from the whales?—Do you mean skeleton bones?

7009. No, whalebone.—That depends on the kind of whale. The whalebones of the Baleen whale are not properly called whalebone, but finners. They are short, coarse, and brittle, and, in fact, of hardly any value at all to-day. Two years ago you could get 30*l.* to 60*l.* a ton, but to-day it is only about 6*l.* or 8*l.* a ton. But the right whalebone is, of course, valuable, although they have depreciated considerably in value.

7010. Merchantable right whalebone is worth how much?—I think about 600*l.* per ton. But three years ago it was up to 2,000*l.* a ton. I believe that they have now found a substitute for it in America.

7011. And your local whalebone is now only 6*l.* to 8*l.* a ton?—Yes. **(Mr. Bearpark.)** Just about the cost of the freight to Europe.

7012. It is hardly worth cleaning and dressing?—No.

7013. You complain about the rate of freight, which is stated here to be 1*l.* 4*s.* 9*d.* per ton?—Yes.

7014. How do you make up that ton?—It is the long ton, 2,240 lbs.

7015. That is taken to a port in England?—To London or Continental ports.

7016. Where is your principal market?—Glasgow is the principal market for whale oil. The extra freight is 12*s.* 6*d.* per ton. It was 7*s.* 6*d.* The increase has had the effect of causing more oil to be shipped to London, Hamburg, or Antwerp.

7017. One would not imagine that 1*l.* 4*s.* 9*d.* is excessive for barrel oil?—**(Mr. Egeland.)** The companies would be well advised in their own interests to go back to the previous rate of 20*s.* a ton.

7018. Then most of the oil would go to the United Kingdom rather than the Continent?—They would have more cargo. What they lose in rates they would make up in quantity.

7019. Have you no local oil market here?—Yes, we are working up one at the present time.

7020. I understand Lever Brothers have gone in for soap-making here?—Yes, they have started taking oil; last year they started buying.

7021. Do you know if they approve of it?—Yes, since the hardening process was discovered the whale oil suits all right.

7022. Since they got the hydrogenating process?—Yes.

7023. They apply that to whale oil?—Yes, you produce a solid, pure fat without smell. In fact, you can make margarine from No. 1 oil, and I believe they do make it in Europe.

7024. Do you think there is a future for your whale oil being made into margarine by the hydrogenating process?—I should not like to express an opinion. I think it could be used, but possibly people would be prejudiced against it. **(Mr. Bearpark.)** There is one large firm of soapmakers in this country who run their own whaling station. They are making soap exclusively from whale oil with practically no other ingredients. They have a station at the Bluff in order to be sure of supplies of oil. They are making soap on a very extensive scale.

7025. Has that proved satisfactory?—So satisfactory that they have been selling soap for some years in South Africa, and without any complaints. They have built up a big business. That would not have been the case had there been any objection. But the process they are using is, perhaps, not so good as hydrogenation. It is successful, but it may not be quite as successful.

7026. But it works fairly well?—Yes, as proved by experience.

7027. Do these people export any soap?—I understand that they are exporting a basic soap—a combination of the hardened whale oil with the alkali. But not in exactly a commercial form. It is, however, easily carried to the final stage by a further process.

7028. A base for making soap?—Yes, a lot of that soap-making base has been imported from the United States to the United Kingdom in the past, made from cotton-seed oil and similar material. **(Mr. Egeland.)** I think about half the output of Natal is now consumed locally.

7029. And you are hopeful that it will all be?—Yes.

7030. By selling locally you save the packing and freights?—Yes. But we get a corresponding short price.

7031. It should be a satisfactory market. I suppose they cut that off?—Yes.

7032. You referred to the protection of whales?—Yes.

7033. The protection of cow whales during the breeding season—is there any way of detecting the female from the male?—No. They are identically the same; you cannot tell from the boat. There is no difference, except under the water where they cannot be seen. **(Mr. Bearpark.)** If I might make a suggestion on that point, I would say that the only way one could bring about any protection from that point of view would be by the collection of statistics whereby one would know when it was expected that a whale would be with calf—possibly coming into very warm waters to deposit their young. There might be something in that. And if it were found by statistics that during a certain period of the year a great number of whales were pregnant or with their calves, it might be to the benefit of the industry to impose restrictions, and to protect those whales from being killed at that particular period.

7034. Do you think the whales have their calves at a certain period of the year?—**(Mr. Egeland.)** That is not my view. I think they calve at any time in the year like any ordinary mammal.

7035. And how often?—I do not think anyone can say with any degree of certainty. But it is generally believed that they can give one calf a year. I have heard it said in Iceland that the same cow returned three years in succession with a fresh calf and that would seem to indicate or prove that they calve once a year. But I think they calve at all times. Possibly more would calve in warm waters, but as far as we have ascertained we have noticed that cows have calves with them of all ages.

7036. So that it is impossible to protect the mothers at all seasons?—I see no possibility of protecting the mothers. **(Mr. Bearpark.)** But there are more calves accompanying the cows in the second half of the Durban season than in the first half.

7037. In regard to the factories, do you make the greatest use of the materials that you have?—**(Mr. Egeland.)** We use up everything—we make oil and fertiliser.

7038. You use the finners and the bones?—Yes. There is nothing more of any value when we have finished. After extracting the oil from the meat we dry the meat and make it into fertilisers, and the bones likewise. The oil is extracted by steam pressure, and the bones are afterwards dried and ground into powder.

7039. You have one clause in the regulations which says that every portion of the whale shall be worked up?—**(Mr. Bearpark.)** Yes, it is only in recent years, and particularly in Durban, after the factories have been fully equipped, that we have been able to deal efficiently with the entire carcase. Because the industry in Durban is under the control of the Health Authorities, and a number of technical men have been engaged on the work with the result that fresh appliances have been introduced for dealing with the carcases—more modern plants have been installed than was the case in former days when whaling was carried on in such places as Iceland and the Falkland Islands.

7040. I think we all agree with you in regard to the value of statistics?—That was my point—that statistics about whaling were probably more urgently required than about any other industry.

7041. Now there are charges for railage that I do not understand. You bring the whales into Durban?—**(Mr. Egeland.)** Yes, I think it is the only part of the world where we handle whales in this way on railway trucks.

7042. You land them on the slip and get them to the factory by rail at some considerable expense?—Yes.

7043. Why do you not land them at the factory?—We have the Indian Ocean there and very disturbed waters. It is impracticable.

7044. You could not put a slipway there?—No.

7045. Are there no harbours within your reach?—No. **(Mr. Bearpark.)** The first whaling station was in Durban Harbour, but it created a nuisance and it had to be removed to the other side of the Bluff.

7046. It seems to me a ridiculous plan to rail the carcase to the factory?—**(Mr. Egeland.)** I think we made a virtue of necessity. There is, of course, a certain amount of smell in connection with the industry, and though it is absolutely harmless it is not desirable to have a whaling station near the town. There was another reason also, and that was that there would be more room on the ocean side of the Bluff than we had this side. **(Mr. Bearpark.)** Further it it is not altogether a disadvantage, because the fact that we are on the railway means that we get our coal to the factory more conveniently, and we can send our oil away by the same way.

7047. So that is some compensation against the heavy rate?—No, not against the heavy rate, because we think that being on the railway line is no reason why this excessive charge should be made on the carriage of the whales.

7048. **(Mr. Garnett.)** I have read your interesting paper, and I have only one question to ask. You have given evidence about the great drop in the price of whalebone. How about other products, have they advanced?—**(Mr. Egeland.)** Yes. Whale oil is to-day very high.

7049. There has been an advance in some parts?—Yes.

7050. Can you tell me what sperm oil is worth to-day?—About 23*l.* or 24*l.* a ton in Glasgow.

7051. What is that up from? What increase does it show?—It is lower. Sperm oil has dropped. Ordinary whale oil has gone up. I think the average price of whale oil for the last ten years in Europe was 20*l.*,

and to-day it is 24*l.* On the other hand, sperm oil has dropped from 34*l.* to 24*l.* a ton.

7052. Of course, that must be very much lower than the top price which obtained, say, twenty-five or thirty years ago?—Yes. **(Mr. Bearpark.)** The main point is that sperm oil cannot be used for the hardening process.

7053. It used to be very largely used for lubrication?—Yes.

7054. Now, of course, mineral oils have driven it out?—Yes.

7055. Your other products. Have you any ambergris?—**(Mr. Egeland.)** We do not get any. We only had one piece of about 7 ozs.

7056. And fertilisers, have they appreciated?—Yes, they make excellent fertilisers, and we have constantly got better prices.

7057. So in place of the price of whalebone you have made it up in your other products?—Yes. Of course, whalebone is a minor matter; we do not get much.

7058. And you think the Government should grant no more licences?—Most decidedly not. I think they have gone too far.

7059. **(Mr. Sinclair.)** You expressed the opinion that Government should not grant any more licences. Have the number of whales decreased in the last few years?—I think so.

7060. One gentleman says there are millions of whales?—Yes, in the sea, but not here.

7061. Has the number appreciably diminished of late years?—I think there are less of a certain species than there were. For instance, last year you will see from my figures the numbers caught were only about 50 per boat as compared with 140 in 1911.

7062. And do you think the numbers have decreased because of the amount of competition, and the number of boats engaged in the trade?—It may be partly due to that, and it may be they have taken another course.

7063. Unless the number has been reduced owing to the number of those engaged in the trade, what object would be served by reducing licences?—There is no room for any more licences.

7064. Unless the numbers of whales have been reduced, what object would be served by decreasing the number of licences?—Because one or two companies may do well, three may mean loss, and four may mean disaster.

7065. That is a matter for those engaged in the industry. I could have understood if the number of licences issued had resulted in the schools of whales being decimated, the suggestion that licences should be reduced in number, but so long as the numbers are approximately the same what is the object?—There is another point, and that is this, that if the whales are chased as they migrate past the coast they become very shy as a rule and you cannot get within reach of them. You have to get within a certain distance for the shot to be effective, and if the whales are constantly chased they become very shy, because they are very intelligent, and they very soon get to know the distance it is safe to keep away, but I do think the number of whales has fallen off.

7066. That would seem to form a ground for reducing the licences?—It is also very difficult to get near them. **(Mr. Bearpark.)** It is more a question of area and the number of boats operating than a question of the number of licences. I do not think boats operating from Durban have made any appreciable difference in the number of whales near Durban, but I do think that the great number of boats operating here have had the effect of frightening the whales away, so that they are taking a different course.

7067. They would be pursued, I take it, by the boats that survived. However, you say that you think the only direction in which the Government can help you now is by reducing the charges in different directions?—**(Mr. Egeland.)** Yes, because I reckon they have allowed so many licences now that they are not likely to allow any more, seeing that the industry is not paying its way as a whole. I also think the railage charge of 4*l.* per carcase is ridiculously high for 1½ miles.

7068. I take it that you have made representations, but unsuccessfully?—Yes.

7069. **(Mr. Tatlow.)** Is the whale put bodily on the railway trucks and carried to the factory?—Yes.

7070. How long would it be?—The largest Blue-whale conger was 95 feet long. Average about 40 feet.

7071. How much would it weigh?—The largest about 100 tons.

7072. And how many trucks are used to convey the carcase?—One, two, or three, according to the size of the whale.

7073. What is the length of them?—They are specially constructed.

7074. What is the distance they are conveyed?—From 1½ miles to 3 miles.

7075. Is it only 2 miles to the factory?—It is only 2 miles to our factory.

7076. You spoke of the rate being exorbitant. What is the charge per ton?—They charge 5*s.* per ton on the oil to the Point.

7077. No, I mean for taking the whale bodily round to the factory?—The rate works out at about 1*s.* 4*d.* per ton per mile, but they are carrying mostly water, because most of the whale's carcase is water. Most of the fertilisers are carried over the country at 1*d.* per mile.

7078. It is rather a special service?—Well, we do the loading and the off loading.

7079. They provide the railway trucks and the locomotive power?—Yes, that is all.

7080. They have been approached?—Yes.

7081. What do you say is the charge on the products?—5*s.* for oil shipped from the factory to the Point, a distance of about 16 miles.

7082. **(Mr. Lorimer.)** What I gather from you is that you want more sympathetic consideration from the Government?—**(Mr. Bearpark.)** I am not looking for much sympathy.

7083. Your paper seems to suggest that you are hardly treated by the Government, and I thought you wanted more careful consideration than you had received?—Our chief complaint is that the Government has not confined the industry within reasonable limits. They have allowed the industry to be overdone to such an extent that it is hardly possible to make a success.

7084. You are not wanting any special consideration in respect to tariffs?—Yes, I certainly think so.

7085. I want to point out that that is quite outside our reference?—Yes.

7086. **(Mr. Campbell.)** You give here the amount of licences paid for whaling purposes. As I understand from what I can see of the system under which whaling is carried on here, small boats go out from Durban whaling on their own independently, and there are big boats, or at any rate one large boat, that goes out attended by small whaling boats and carries on the manufacture of whaling products on the boat. Is the licence for the same in both cases, and what is the licence charge?—There is only one floating factory belonging to Durban, and it is not operating in these waters at all. It happens to be in the harbour at present, but in a month's time it will proceed to the west coast, and that is its proper field of operations. We have no floating factory here at all. That one operates on the west coast at Walfisch Bay. The Provincial Government of Natal have imposed a licence of 5*l.* for each whaler; in addition to that we pay a licence to the Union Government Harbour Department.

7087. And does the Cape Government issue a licence?—I am not sure if they do.

7088. Whalers use the harbour at Table Bay?—Yes.

7089. What use would the regulation of the industry be by the Natal Government if the Cape Province, which is alongside you, does not co-operate to regulate the industry?—Well, I can only say this, that our expenses are already so high that it has been found by actual experience that only one out of six

companies has been able to make any profit at all. Our expenses are very high, and the licences and the contributions to revenue are, in proportion to the extent of the industry, the largest in the world in which whaling is carried on, I think, and any reduction in the charge which the Government would make would help to make the industry pay.

7090. You are referring to the expenses of carrying on the industry, but I am referring to your proposal to control the industry by means of some ordinance similar to the Japanese Ordinance?—I think that is too late now so far as we are concerned. I think it is a case of closing the stable door after the steed has gone.

7091. You are not in favour of any control of the industry at all then?—(**Mr. Egeland.**) I think not. It is too late here. The only thing we can expect the Government to do is to reduce its charging on whaling gear, railage, and so forth.

7092. Do you not propose a restriction of the number of the licences issued?—I do not think any more applications will be made.

7093. Does that not bring you up against the same difficulty, the Cape Province may issue a lot of licences?—No, the Union Government controls the licences now, I think. The Provincial Government and the Union Government both seem to have a say in the matter.

7094. That seems to mix the matter up still more?—Yes, I think they look upon whaling as a huge joke and a fit game for plunder.

7095. Do you not think it would be far better if the power of issuing licences in connection with an industry like this, which spreads round the whole coast, were restricted to the Union Government rather than to the Provinces?—Yes, certainly, I think there should be one authority to deal with the whole thing.

7096. Taking away the power of regulating the industry by the Provinces and giving it to the Union Government?—Yes, but the Provincial Council was looking for money and they thought there was chance.

7097. You think it would be better to have only one control?—There should only be one control, and I think that should be in the hands of the Union Government.

7098. Are there any other companies operating here outside the South African companies. Do the Norwegian companies operate on this coast?—No, not in Natal, except the one we have at the Bluff. The first company that started here was a Norwegian company, but I understand they are closing down this year because of competition.

7099. You have no companies working with Norwegian capital?—Only the South African Whaling Company.

7100. There is one company?—Yes, there is one at Plettenberg Bay.

7101. They would have a big advantage if they did not pay any duty on their accessories?—They would have to pay duty as well as we, because these things would have to be landed, and they would not be landed without duty being paid.

7102. Would they land any of it?—Yes, they have stations of their own on shore.

7103. But I am speaking of their whale-catching plant, they would not pay duty on that, would they?—Yes.

7104. Although they did not land it in South Africa?—They do land it in South Africa. They have stations on shore. There are no floating stations on the east coast now. There are several on the west coast, mostly Norwegian.

7105. You have no difficulty in that way of competition by outsiders?—No.

7106. The conditions are exactly the same?—Yes.

Natural Resources: Cotton.

APPENDIX II.

(B).

Report by Mr. N. F. Howe Browne on the First Crop of Cotton from the Chalumna Cotton Plantations, East London.

(*See Question* 5897, *p.* 279.)

At the end of July 1913 we commenced farming operations on the farm, Angler's Home, with a view to cotton-growing.

In all about 60 acres were planted, mostly during the month of November, the seed being supplied through the agency of the British Cotton Growing Association, and being of the variety known as Allen's Long Staple.

We soon began to find that conditions as they existed here were not altogether suitable for the plant, the incessant tremendously high coastal winds retarding its growth in the early stages of its development very considerably. This would apply to most crops, and the provision of adequate windbreaks was recognised to be a necessity. It was, of course, impossible to provide these last year, but as soon as it was possible, rows of plantains were planted about 50 yards apart all through the lands. These are generally used in these parts for the purpose, and appear to act very well. They are now commencing to make some growth.

In spite of adverse weather conditions, the crop made fair progress, and about February this year was really looking as well as a cotton plantation could, and, so far, I was very well satisfied with the possibilities.

Just about this time I began to notice that some of the plants were not looking healthy and seemed to be wilting. However, the trouble did not appear to be a serious one so far as the crop was concerned. However, I had several Government experts out here in March, and on their advice I sent several plants to the Government Pathologist at Pretoria for examination. I may state here, that since then, I have sent, at their request, about four different lots and they report that there is no doubt that the trouble is a fungus in the soil and is the cause of the disease known as Wilt. I was at first afraid that this had been introduced here by means of the seed which I planted, but the Government expert assures me that the soil fungus which is my trouble here is not the same as that in the States, though its ultimate effects might very well be the same, and the difficulty would have to be got over by planting Wilt resistant strains of cotton, as has to be done on a a great many plantations in U.S.A. After a very dry season, the whole country being afflicted with a prolonged drought, we got rain about the middle of March, and then such a tremendous weed growth appeared among the plants that it was quite impossible to cope with it with the labour available, and about 40 acres had to be abandoned and ploughed up. I may mention here that the weed growth on these river lands is quite exceptional, and even now is the greatest obstacle in our agricultural work on the farm

To proceed, picking commenced about the middle of April, but the plants had not matured the lint properly and the opening of the bolls was scanty, the consequence being that the amount which could be

picked in one day by a hand, and an inexperienced one at that, was small in the extreme, and since it is quite impossible to get this native labour to work at piece work, I found that paying children sixpence a day and feeding them made the gathering of the crop more expensive than it is anywhere else in the world. Indeed, it is my opinion that the Kaffir labour here is absolutely impossible for the gathering of a cotton crop which has to be done by hand. We are finding that labour-saving implements are just as necessary here in agricultural work as they are in countries where farm labour is supposed to be more expensive. I find that this labour is the most expensive I have ever come across, though it *appears* to be cheap enough. As a matter of fact, the greatest obstacle here to cotton growing is the labour. We are situated in the midst of a population of about 150,000 natives, and I am certain that if we had a hundred bales of cotton which wanted picking I could not get the work done, for when the picking season was on these natives would have reaped their mealie crop, and when they have food to eat, no price will make them work. What can be done in the future with white labour is a problem which has yet to be tackled, and one cannot but hope that it soon will be, for there is no doubt that this part is much too good for the Kaffir and his laziness.

In all we picked only two bales of about 400 pounds of lint in each, and consequently the crop was run at a very considerable loss, though this was not entirely the fault of the weather conditions. There can be no doubt that the crop was planted too late, for it takes longer to develop its bolls here owing to the fact that it is not nearly as hot as it is in the established cotton belts of the world.

A sample of the lint produced was sent to the British Cotton Growing Association, and they report its value as 6·30 pence based on American Middling, 6*d*. This price is, I must confess, somewhat lower than I had expected, and I am afraid that we will have to improve on that to be successful here.

To sum up, my experience this year has shown that, first of all, suitable windbreaks must be provided throughout the cotton fields, for the winds are incessant and severe.

Secondly, the cotton takes much longer to develop here and it seems to me that that difficulty would best be met by the development of a local variety for these parts which would develop and open quickly under the prevailing conditions. This is by no means impracticable.

Thirdly, I do not consider that the disease which appeared in this crop would prove to be an insurmountable difficulty, should cotton prove to be a paying crop here, for there are many Wilt resistant varieties which could be procured and planted.

Fourthly, the labour difficulty is a serious one. As I have gone into this more or less minutely in the body of this report, further comment here is not necessary, except to state that my evidence given before the Commission*, was before I had actually come into contact with it as a picking proposition.

In conclusion, I may state that we are planting another crop here this year. Indeed, it is already in the ground and most of it up, so that we may give the plant another thorough trial in the light of past experience.

N. F. HOWE BROWNE, Manager,
The Chalumna Cotton Plantations,
Angler's Home,
East London,
South Africa.

October 1914

INDEX OF NAMES.

ABERCROMBIE, H. R., member of the Pretoria Chamber of Commerce: - - - 3089–3188
DELAGOA BAY:
Bunkering trade - - - - - 3143–7
Facilities - - - - - - 3111–4, 3173
Fixed proportion of traffic, awkwardness of, and need for amendment of agreement - 3091–111, 3126–30, 3131–42, 3148–68
Railway communication with Pretoria 3175–86
Railway rates 3092, 3094–7, 3103–23, 3148–68, 3176–2, 3187–8

ANGUS, FREDERICK THRELKELD, Senior, Vice-President of the Co-operative Agricultural Union, wattle bark industry - - - 6316–6413

ANGUS, W. N., Jnn., wattle industry - 6414–41

ANSTEY, NORMAN, Mayor of Johannesburg, cable facilities - - - - - - - 1732–65

BAUMANN, GUSTAV, Government Land Surveyor, irrigation in Orange Free State and suggestions *re* storm-water storage - - - - - 734–803

BAYNES, SENATOR THE HON. JOSEPH, C.M.G., farmer, Natal: - - - 1002–9, 5335–5440
Agriculture and prospects for immigrants 1002–9, 5390–7
Bacon factory - - - - - - 5359–63
Cattle and horse-dipping 5364–9, 5369–71, 5434–9
Closer settlement - - - - - 5346, 5363
Dairy industry - - 5335–59, 5373–89, 5398–413
Locust plagues and their elimination - - 5369
Malarial mosquito - - - - - - 5372

BEARPARK, F., manager of a whaling company, p. 324, 6946–8, 6958–61, 6962, 6964, 6968–71, 6983–6, 7004–5, 7011–6, 7024–8, 7033, 7036, 7039–40, 7045–7, 7052–4, 7066, 7082–90

BECK, Senator the HON. SIR J. H. MEIRING, M.D., wine industry - - - - - - 6505–6579

BEKENN, WILLIAM, manager of the Fairleigh Colliery, Natal coal trade and railway rates p. 146

BENJAMIN, Mr. Advocate LOUIS EDMUND, K.C., LL.B., bills of lading - - - 1766–1771

BOCK, CARL HEINRICK, JUN., wool buyer: 1557–8, 4497–4550
Freights homeward - - - - - 1557–8
Wool industry - - - - - - 4498, 4550

BOURKE, EDMUND FRANCIS, President of the Pretoria Chamber of Commerce: - 5441–5494
Agriculture - - - 5449–65, 5476–7, 5479–85
Dairying industry 5444, 5448, 5465–8, 5482, 5492–4
Irrigation - - - - 5454, 5479, 8486–91
Maize - - - - - 5442–3, 5447–8, 5476–8
Pig industry - - - - - - - 5444–8
Pretoria, position and prospects - 5441, 5469–71
Tobacco cultivation - - - 5441, 5472–3
Wheat cultivation - - - - 5441, 5486–91

BRABANT, Major-General SIR EDWARD YEWD, K.C.B., C.M.G.: -501–579, 4571–4612, 5904–9
Agriculture and land settlement - 501–79, 4572–9
Cattle-dipping - - - - 4571, 4587–607
Cotton-growing - - - - - 5904–9
Debe Nek, Kaffir settlement - - 4580–2, 4608–12

BRIGHT, W. B., Joint Manager for the Rustenburg Citrus Growers Limited, Transvaal citrus industry - - - - - - - - p. 321–2

BROWNE, N. F. HOWE, B.A., cotton grower 5753–5903, pp. 329–30

BUCHANAN, ALEXANDER, Chairman, Durban Chamber of Commerce, Durban Harbour, particulars *re* facilities, trade and freights 1643–69

BULMER, RALPH, Government Fruit Inspector 6803–10

BURTT-DAVY, JOSEPH, F.L.S., F.R.G.S., F.R.H.S., F.R.C.I., F.R.Soc. Arts:
Maize industry - - - - - - p. 272–3
Farmers, need for - - - - - - - p. 273
Teff-grass - - - - - - - - p. 273

BUTCHER, WALTER, Vice-Chairman, Durban Chamber of Commerce, Durban Harbour, particulars *re* facilities, trade and freights 1643–86

BYRON, Senator Colonel the HON. JOHN JOSEPH, C.M.G., land settlement, conditions and prospects 330–49

CAMPBELL, Senator the HON. MARSHALL, Cape Town: - - - - p. 75, 6113–124, 3886–963
Fibre - - - - - - - - - 3907–9
Shipping - - - - - - - - p. 75
Sugar industry, Natal - - 3886–904, 3910–63
Wattle industry - - - - 6113–124

CARTER, W. H., irrigation - - - 638–94

CHAMBERS, R. F., representing Town Council of Oudtshoorn, tobacco industry - - 4301–47

CHAPPELL, ERNEST, J.P., representing the Johannesburg Chamber of Commerce: - p. 49, p. 81–2, p. 91, p. 140–5, p. 161
Cable facilities - - - - - - - p. 82
Empire development - - - - - 3271–4
Johannesburg as distributing centre - 3257–9
Railway rates and fixed proportion of traffic between ports - - - - 3200–3, 3229, 3256
Shipping services and freights - p. 81–2, 1728–9
Through bills of lading - - - 1882–3

CLIFT, WILLIAM EDWIN, Port Captain and Marine Superintendent, Port Elizabeth - 2588–612, 2617–23, 2638–49, 2651–9

COOK, F., Managing Director of F. Cook Co., Ltd., Cape Town, bunkering - - - 2047–170

DOYLE, MAJOR RICHARD DINES, D.S.O., representing the Transvaal Agricultural Union: p. 254–265
Cattle and dairying - - - - - 5603–17
Mutton production - - - - - - 5640

DUMARESQ, R. H. F., representing Messrs. William Cooper and Nephews, dip manufacturers 4551–70

DUNLOP, ROBERT, Secretary, Pietermaritzburg Chamber of Commerce: - - - p. 80–1
Cable facilities - - - 1709–15, 1719–22
Mail services - - - - - - 1719–24
Shipping - - - - - - - 1716–8

EADIE, DUNCAN MACINTYRE, representing the Natal Agricultural Union (present) p. 41–4, p. 238–41

EDMEADES, E. T. L., representing the Oudtshoorn Farmers and Fruit Growers' Association: 4080–274
Dairy farming - - - - - - 4194–205
Fruit-growing - - - - - - 4152–3
Irrigation - 4107–22, 4157–8A, 4169–70, 4206–19
Lucerne cultivation - p. 189, 4083–6, 4123, 4161
Ostrich feather industry - - p. 189–90, 4080–
Tobacco cultivation - - - - - 4152–3

EGELAND, JACOB J., Managing Director of the Union Whaling Company - p. 322–4, 6961, 6941–5, 6962–8, 6971–83, 6986–7004, 7005–11, 7017–24, 7028–33, 7034–8, 7041–5, 7046–52, 7055–66, 7067–81, 7091–106

EHRLICH, W., J.P., Vice-President Bloemfontein Chamber of Commerce, harbours and railway rates 2771–2

EVANS, MAURICE SMETHURST, C.M.G.: 804–909
Farming and land settlement - - 835–6, 843–6, 894–7, 909
Immigration prospects - 805, 806–17, 820–1, 832–4, 838–42, 847, 851–63, 867–9, 890–3
Labour conditions - - - - - - 805–909

EVANS, OSCAR, farmer and member of Land Board: 462–83, 4365–459
Irrigation - - - - - - - - 462–8
Land Board - - - - - - 469–77, 481–3
Land settlement - - - - - - 478–80
Ostrich farming - - - - - - 4365–459

FICHARDT, ARTHUR EMMANUEL, President of the Bloemfontein Chamber of Commerce:
Borer insect and codling moth - - 6125–94
Eucalyptus plantations - - - - 6189–91

FINDLAY, F. R. N., representing the Transvaal Agricultural Union, tobacco industry 5706–20

Coal bunkering - - - 3009–21, 3035
Details *re*, and improvement schemes 2947–66, 2969–71, 2973–93, 3005–8, 3023–31

INDEX OF SUBJECTS.

Acetone, supply at present from foreign countries but possibility of supply from Natal with support from War Office, *Fraser* - - - p. 294–5, 6255
African and European Investment Co., Ltd., letting of land by, particulars *re* system, &c., *Palmer* - p. 49

Agricultural Produce:
Exhibit being made up by Department of Agriculture for Imperial Institute, *W. B. Wilson* 5156–8
EXPORTS:
General development hoped for, *F. B. Smith* 3786–9
Increasing, *M. S. Evans* - - - - 895–7
Value, 1907, 1912, *F. B. Smith* - - - p. 177
FOODSTUFFS:
Competition with profit in world's markets not likely for many years, *Moffat* - p. 249, 5514 5519–23
Importance of South Africa being self-reliant, *Stephen* - - - - - - - - 3965
Production of, sufficient to meet local requirements, anticipated in 10 years time, *Moffat* p. 249, 5517
Import of, *M. S. Evans* - - - 805, 894–7, 908
Imports, value, 1907, 1912, *F. B. Smith* - p. 177
Production, abundance of low-priced labour tends to slacken, *M. S. Evans* - - - - - - 909
South Africa should be large exporter, *O. Evans* 4392–7
Variety of, *MacDonald* - - - - - p. 268

Agriculture:
see also Land and Land Settlement *and particular crops.*
Agricultural Societies, *Oxenham* - - - 3637
Attention only seriously devoted to, since the war, *Moffat* - - - - - - p. 249, 5500
CAPE PROVINCE:
Advantages of farmer starting on small scale, *Brabant* - - - - - - - 573
Development, prospects of, with extension of irrigation, and nature of crops that can be grown, *Mackay* - - - 404–13, 423–8
500 acre farm, crops that could be grown, labour required, &c. *Brabant* - - - 533–40
Intensive farming, population insufficient for *Brabant* - - - - - - - - 513
Labour, *see that title below.*
Machinery:
Introduction of, owing to higher wages demanded by Kaffirs, *Brabant* - - - - 543–6
Prices probably high compared with America, *Brabant* - - - - - - - 574
Rise in price of farm land, *Brabant* - - 577–9
Carrying capacity per acre, increase, *F. B. Smith* 3873
Coastal belt, prospects of developing, *Mackay* 417–21, 453–4, *Brabant*, 4573
Colleges, particulars *re*, and possibilities of immigrants going to, *M. S. Evans* - - - 814–7
DEPARTMENT OF:
greater Assistance from Great Britain in training men as experts desirable, *F. B. Smith* - 3825
Communication with U.S.A., *F. B. Smith* 3816–7, 3823
Divisions of, and expenditure on, 1913, *F. B. Smith* p. 176
Functions, *F. B. Smith* - - p. 176, 3751
Idea of, taken mainly from Transvaal institution founded by Lord Milner, *F. B. Smith* - 3826
Officers, difficulty in obtaining, *F. B. Smith* p. 176, 3825
Veterinary work, communication with Board of Agriculture at home and Imperial Institute, extent, *Gray* - - - - - - 5551–5

Agriculture—*continued.*
DEVELOPMENT:
Discouraged by lack of facilities for getting produce to markets, but gradual remedying of, *Moffat* p. 249, 5536–7
Hindered by attraction of gold and diamond mining, *Byron*, 331; *Bourke*, 5483, 5484–5; *Robertson*, 5698–9.
Need of railways for, *Macdonald*, p. 48, p. 49; *Stephens*, 3972.
Possibilities and need of greater organisation and influx of experienced farmers to invest capital, &c., *Madge* - - - - - - - p. 51
Prospects, *F. B. Smith*, p. 177; *Baynes*, 5390–4; *Gray*, 5590–1.
Since 1904, shown in census returns for 1911, *Moffat* - - - - - - p. 249, 5501
great Developments, *Madge* - - - - p. 51
DRY FARMING:
on Coastal belt, market for produce, *Mackay* 438–43
Expenditure on, by Department of Agriculture, 1913, *F. B. Smith* - - - - - p. 176
Explanation and method, *Macdonald* - - p. 268
Pretoria district, increase and prospects, *Bourke* 5479–82
Profitableness and possibilities compared with irrigation, *Macdonald*, p. 48; *Palmer*, p. 49; *Robinson*, 1051–2.
Prospects, *Kanthack*, 129–30; *Macdonald*, p. 267–8.
Education, details *re* expenditure, fees, &c., *F. B. Smith* - - - p. 176, 3767–71, 3774–5
FARMERS:
Agricultural banks, opening for, *Johnston* 4909–12
Attitude towards instruction by Department of Agriculture, *F. B. Smith* - - 3755–7
with Capital, need for, from England and Scotland, *Burtt-Davy* - - - - - p. 273
Capital required, *Stephen* - - - - 3992
European, number, 1904, 1911, *F. B. Smith* p. 177
Facilities for raising money, *Johnston* 4905–8
Organisation of, and assistance to obtain markets for produce, *F. B. Smith* - - 3776–9
Size of families and work taken up by sons, *M. S. Evans* - - - - - - - 847–50
Small, suitability of pig industry to, *Pilkington*, 5679–5689; *Robertson*, 5702.
FARMING:
in Experimental stage to great extent, *Bourke* 5482
Larger proportion of men interested in, than in any other part of the world, *Macdonald* - p. 49
Mining men are more or less interested in, *Macdonald* - - - - - - - - - p. 49
FARMS:
Excessive size of, *Macdonald* - - p. 47, p. 48
Limit desirable for one family, capital required, &c., *Kanthack*, 76–83; *Bourke*, 5460–2.
Size of, *Kanthack* - - - 30–3, 118–20
Total number in Union, 1913, *Hughes* - 280–1
FERTILISERS AND MANURES:
Artificial manures:
Admission duty free, *F. B. Smith* - - p. 177
Low railway rates, *F. B. Smith* - - p. 177
Import, value and weight during six months of 1910 - - - - - - - - p. 259
Traffic carried on railways, 1912, 1913, *Hoy* 2480, p. 148
Transvaal:
see also under Maize.
Customs duty on, at coast ports, suggestion p. 259
Railway rates, and need for decrease p. 258, p. 259

Agriculture—*continued.*
Heavier crops per acre obtained than in any other country, *Macdonald* - - - - - p. 267
little Information obtainable in England, and more extensive advertising needed, *Macdonald* - p. 48
Instruction for new arrivals, opinion *re*, *F. B. Smith* 3774–5
Irrigation, *see that title.*
Itinerant inspection, system, and development anticipated, *F. B. Smith* - - - 3772–3
Kalahari, size of farms and nature of, *Kanthack* 32, 84–9

LABOUR:
Cape Province, native labour:
Advantages of master working with, *Brabant* 540, 563–5, 575–6
no Difficulty experienced in obtaining, personally, *Brabant* - - - - - 539, 552–7
Kaffir women, *Brabant* - - - 568–70
Obtainable if sufficient price paid, *Brabant* 558–62
Wages and increase, *Brabant* - - - 566–8
not Cheap, *Moffat* - - - - - 5538–9
Coloured, preferred by farmers and employers (for unskilled purposes), *Jagger* - - 179, 181
German immigrants in early stages only people not using native labour, *M. S. Evans* - 836
Natal:
Indian, advantages over native, *Scott* - 5269, 5271
Natives not satisfactory, but improving, *Scott* 5269
some Sons of farmers supervise, but not sufficient, *Scott* - - - - - - - - 948–9
Supply, and effect of wages on, *Scott*, 5271–6; *Marwick*, 5301.
Native:
Comparison with white, *M. S. Evans* - 819, 824, 899
as Good supervisors, very rare, *Scott* - 952.
no Openings for Europeans in competition with, *Baynes* - - - - - - 1002–5
Question as to efficiency and of increasing capacity of, by Government, *M. S. Evans* - 898–907
Wages, and lowness of, compared with New Zealand and other colonies, *M. S. Evans* 805, 806, 818, 870–7

LAND:
Increase in amount under cultivation, *F. B. Smith* p. 177, 3796–7
Proportion of, to pastoral, *Kanthack* - 97–106
Quality and value, *MacDonald* - - - p. 268
Losses from drought and hail, considerable, but reduction, *F. B. Smith* - - - - p. 177

MACHINERY AND IMPLEMENTS:
Import duty, *F. B. Smith* - - - - p. 177
Rates from London, New York and St. John, *Jagger* - - - - - - - - 1248–9
Reduction of railway rates, 1912, *Hoy* - 2440
Traffic carried on railways, 1912, 1913, *Hoy* 2478, p. 147
Men with experience preferable to men with capital as tenants, though some capital necessary, *Palmer* p. 49

MIXED FARMING:
Best on the whole for the country, and special farming in special districts, *F. B. Smith* - 255
Considered the future of South African farming, *Bourke* - - - - 5453, 5463–4, 5469
and More thorough cultivation, tendency to, *F. B. Smith* - - - - - - - - 242
More could be done by Government and the mines, *Macdonald* - - - - - - - p. 49

NATAL:
Comfortable conditions, *Baynes* - - 1005
Co-operative union, particulars *re*, *Scott* 5277–91
more Cultivation than before cattle plagues, *Scott* 5299–300
Facilities for raising money, *Jones* - - p. 267
Farming, standard varies, European cultivation generally fairly good, native generally very inferior, *Scott* - - - - - - 945
Many farms let to natives, *M. S. Evans* 855, 863
Labour, *see that title above.*

Agriculture—*continued.*
NATAL—*continued.*
Large and increasing proportion of sons of townsmen going on land, *M. S. Evans* - - 866
Prospects, *Marwick*, 5315–24; *Baynes*, 5390–4.

NEWCASTLE DISTRICT:
Labour, difficulty and wages equal to those in towns advocated, *Jones* - - - - p. 267
Prospects, capital required, land available, price, &c., *Jones* - - - - - p. 266, p. 267
Orange Free State, reduction in size of farms, *Byron* - - - - - - - - 348–9
Oudtshoorn district, most of ground under lucerne, next largest crop tobacco, *Martin* - - 4285

OUTSIDERS:
Amount of capital required, *Palmer*, p. 49; *M. S. Evans*, 809, 832–4, 851.
Experience of local conditions essential before starting alone, and elaborate training in other countries a mistake, *M. S. Evans* - - 811–3
Openings for, and prospects, *M. S. Evans*, 808–10, 867–8; *Baynes*, 1006–9.
Parcel post rate, *F. B. Smith* - - - p. 177
People more attracted by mining in the past, but tendency now towards farming, *Robertson* 5698–9
can be Profitable even with droughts, *Bourke* 5449–56, 5460
Railway lines for development of, *see under* Railways.
Recovery of, after rinderpest and war - - p. 269
Schools for, majority of students settle on land, *F. B. Smith* - - - - - - 3810–1
Scientific research and itinerant instruction, provision insufficient and must be increased, *F. B. Smith* - - - - - - - p. 176

STATISTICS:
Establishment of bureau under Government under consideration - - - - - - p. 269
Improvement desirable, *Robertson* - 5632–3
Lack of, and need for proper basis, *Macdonald* p. 267
not very Reliable, but collection by Department under consideration, *Moffat* - - - 5532–3
Unreliability, *Pilkington* - - - - 5684–8
not Taken up owing to ease of making living by cattle or ostrich farming, *Brabant* - 4571–2
Tendency towards, *Brabant* - - - 4574–5

TRANSVAAL:
Dry farming:
Important part would be played by, in development of country - - - p. 257
Leasing of farms, failure in the past, *Hughes* p. 13
Educational system should be changed, to create interest in country life, &c. - - - p. 259
Farms, excessive size of, *Macdonald* - - p. 47
Hindrances to farmers, and proposed remedies p. 259
Hindrances, and wonderful advance in spite of, *Robertson* - - - - - - 5697–8
Labour facilities, importance of - - p. 259
Majority of farmers short of capital, *Pilkington* 5679
Profits that can be made, *Burtt-Davy* - p. 273
Prospects, *Bourke* - - - - - 5463–5
Remodelling of methods, need for - - p. 257
Wealth of country lies in, *Carter* - - 691
Winter feed, insufficient amount grown, *Robertson* 5695–6
Winter feed, development of, *Byron* - - 348

Ale, beer and stout, traffic on railways, 1912, 1913, *Hoy* - - - - - - - - p. 147, 2478
Algoa Bay, *see* Port Elizabeth.
"Angler's Home" Farm, notes by T. Garnett on visit to - - - - - - - - - p. 285
Angora goats, numbers in Cape Province and Orange Free State, 1865–1911, *Moffat* - - p. 271, 272
Angora hair, exports, value, 1907, 1912, *F. B. Smith* p. 177
Anthrax, *see under* Diseases of Animals.

Argentine:
Freights, comparison with South Africa, *Wiener*, 1437–8, 1449–51; *Spilhaus*, 1544–9.

Argentine—*continued.*
Maize production, comparison with South Africa p. 269–70
Ostriches, large number, but small value of feathers, *Holland* - - - - - - - 4461–3

Artesian Water:
BORING OPERATIONS:
Cape Province, *Hughes* - - - - p. 13
Cost, *Kanthack* - - - - - 6–9
Decrease of volume of water in shallow holes, but increase in modern, *Kanthack* - - 131–4
Deep, benefits of, *Macdonald* - - - p. 47
Depth of finding water, *Kanthack* - - 123–4
Drills:
Fully occupied, *Kanthack* - - - 128
Hiring of, to private individuals, *Kanthack* 6
Estimate of quantity of water developed by, *Kanthack* - - - - - - p. 53–4
Expenditure by Government, *Kanthack* - 6
Government machines, increased charges being made for use of - - - - - - p. 52
Griqualand West:
Drilling, by private contract, cost of, and cheaper than by Government, *Radloff* 720, 723–33
Drills to penetrate dolomite desirable, *Radloff* 721
no considerable Experiments, but extension would be justified, *Radloff* - - 719–31
Sources of water, *Radloff* - - - 715–8
Windmills, large number being put up by farmers, *Radloff* - - - - 711–3
Increase in value of land, *Kanthack* 110–7, 145–7
Poisonous water only, found in part of Gordonia, *Kanthack* - - - - - - - 121
Subsidised, statistics, *Kanthack* - - - p. 53
Transvaal - - - - - - - p. 52
Undertaken before allotment of land in dry areas, *Hughes* - - - - - - - p. 13, 276
Water generally found, *Kanthack* - - 114–6
Causes of supplies, *Baumann* - - 761–7, 769
Sources of water, question, *Baumann* - - 768
Supplies precarious and sometimes bad in quality, *Kanthack* - - - - - - - - 3–5

Australia:
Bunkering of ships at Cape Town and Durban, *see under* Cape Town *and* Durban.
Butter, comparison of quality with Natal, *Jones* p. 267
Dumping of surplus sugar in South Africa, *Campbell* 3928
Exhibition of South African tobacco in, desired, *Findlay* - - - - - - - 5708–10
EXPORTS TO:
Maize, *Burtt-Davy* - - - - - p. 273
Oat-hay, refusal to accept Government certificate of freedom from disease, *Liberman* - 3294–300, 3342
Wattle bark, *Campbell*, 6117; *F. T. Angus*, 6318–9; *Legat*, p. 287.
Freights, comparison with South Africa, *Jagger*, 1249–53, 1298; *Wiener*, 1436–8, 1449–51.
Fruits, competition, *Pickstone* - - - 6665
IMPORTS FROM:
Butter, *Liberman* - - - 3306–7, 3392–3
Grain bags, size, and not merchantable in South Africa, and standardisation of size desired, *Liberman* - - 3301–5, 3343–6, 3434–42
Leather, *van Breda* - - - - - 3512–20
Meat, *van Breda*, 3530–2; *Scott*, 5292–3; *Johnston*, 4778–9; *Robertson*, 5633, 5639.
Wheat, *Stephen* - - - - 4073, 4078
Wheat and shortages, *Stephen* - - 4061–78
Joint mail service to South Africa and, *see under* Mail Service
OSTRICH FEATHERS:
Competition:
not Considered serious, *Holland* 4461, 4470–2
Possibility, *O. Evans* - 4374, 4400–3, 4456–9
Inferior to South African, *Oxenham* - 3570
Ships, *see under* Shipping, *and particular ports.*
Trade with, balance in favour of Australia, *Stephen* 4079

Australia—*continued.*
WATTLE:
Cultivated area not large, *Fraser* - 6298–9
Export formerly to Europe, *F. T. Angus* - 6318
Tree taken to South Africa from, and grows better, *Fraser*, 6295–7; *F. T. Angus*, 6322–3.
Week-end cables with, not considered, *J. Wilson* 1181–2
Wheat cultivation, impossibility of competing with, *Holland* - - - - - - - - 4484
WOOL:
Comparison with South African, *Oxenham*, 3570; *Gasson*, 4746–7, 4757–8; *Robertson*, 5642–3, 5651.
Competition, question of, *Oxenham* - 3593, 3626–31
Favourable comparison of Cape wool with, in 64 class, *Gasson* - - - 4689, 4728–9, 4738
Freights, comparison with South Africa, *van Breda* 3474–5
Maximum production believed to have been reached, *Bock* - - - 4498, 4508–9
Output, comparison with South Africa, *Gasson* 4744–7
Prices, comparison with South Africa, *Bock*, 4549–50; *Robertson*, 5646–7.
Prejudice against South African wool in London market compared with, *Oxenham* - 3622–5
Automobiles, *see* Motors.

Bacon Industry:
Imports of bacon, &c., *F. B. Smith* p. 177, p. 256
NEL'S RUST FARM FACTORY, NATAL:
Particulars *re*, *Baynes* - - - 5359–63
not Successful, and climate believed to be the cause, *Haarhof* - - - - - 5495
Prospects, *Baynes* - - - - - 5363
Successful at Wellington, Cape Province, *Haarhoff* 5495

Barley:
Few malting plants in South Africa - - p. 257
TRANSVAAL:
Railway rates on, and fertilisers, need for decrease p. 258
Use of, extent of cultivation, &c. - - p. 257
Base ores, low export railway rates, *Hoy* - 2437–8
Baynes, Joseph, Limited, particulars *re*, *Baynes* 5337–8, 5345–7, 5351–9, 5359–63, 5373–81
Beef, *see under* Meat.

Bills of Lading:
Adoption of Australian or American law, not considered, *Benjamin* - - - - - - 1766
absolutely Clean, no scheme would be acceptable, *Hannam* - - - - - - - - p. 92
Complaints chiefly from receiver in England, not shipper in South Africa, *Spilhaus* - - 1773
Contracting of shipowners out of liability:
Hardship and proposed remedies, *Hannam* p. 91–2
no Local legislation interfering with, *Benjamin* 1770–1
Onus of insurance against at least petty damages due to negligence should lie with shipowners, *Hannam* - - - - - - - p. 92
Difficulty of establishing claims against shipowners in court of law, *Hannam* - - - - p. 92
Grain, uniform bill of lading as to, through the Empire advocated, by common agreement, *Spilhaus* 1772
Law the same as in England, since 1879 and reasons, *Benjamin* - - - - - - - 1766–8
Legislation advocated to prevent evasion of claims carrying moral liability, *Hannam* - p. 91–2
little Litigation in South Africa, *Benjamin* 1767
Narrowing of, in interests of shipper, trade might be diverted, *Benjamin* - - - - - 1768
any Policy adopted in England could be followed in South Africa, *Benjamin* - - - - 1769
THROUGH:
Advantages, and scheme advocated, *Wall* 1774–851
not Advocated by Johannesburg Chamber of Commerce, *Chappell* - - p. 91, 1882–3
Formerly in existence, but relinquished, *Chappell* 1883
Bloemfontein Chamber of Commerce, member, *see* Fichardt, A. E., Ehrlich, W., *and* Smetham, W. G.

Bloemfontein District :
Forests and timber, *see that title.*
Fruit industry, *see that title.*
Board of Agriculture, more assistance received from, recently, *F. B. Smith* - - - - - 3761
Botany, expenditure on, by Department of Agriculture, 1913, *F. B. Smith* - - - - - p. 176
Brandy, *see under* Wine Industry.
Bricks and building stone, traffic carried on railways, 1912, 1913, *Hoy* - - - - - p. 147, 2478

British Cotton Growing Association :
Experiments by, *F. B. Smith* - - - 5748–50
no Monetary assistance received from, or guarantee of fixed price for cotton, which would be useful, *Browne* - - - - - - - 5852–3
not Responsible for injury to industry in Zoutpansburg district, but independent company, *R. R. Smith* - - - - - - - p. 283
Shipment of cotton to England under agreement with representative of, non-success, *Scherffius* 5953–5

British East Africa, Ostrich Feathers :
Competition from, *O. Evans.* - - - 4398
Small output, *Holland* - - - - 4461
Brooms, rates from London, New York, and St. John's, *Jagger* - - - - - - - - 1248–9

Building :
Cost excessive and lower railway rates on building materials desirable, *Abercrombie* - - 3170
Heavy building lines, reduction of railway rates, 1912, *Hoy* - - - - - - - - - 2439
White labour chiefly and wages high, *M. S. Evans* 805

Butter, *see under* Dairying industry.

Cables :
Decreasing traffic and decreasing rates since war, *J. Wilson* - - - - - - - 1157–9
DEFERRED :
Code rate used in business more than, *Jagger* 1227, 1234–5
probably more Expensive than code messages, *Jagger* - - - - - - - - 1255
Facilities :
well Advertised and use of, growing, *J. Wilson* 1166–9
not yet Sufficiently known, *Jagger*, 1227 ; *Smartt*, 1319–24, 1327–8.
Figures should be allowed if not code, *Orr* 1569–71
Less used than code or week-end system owing to disabilities, *Orr* - - 1584, 1588–90, 1594–7
Rates :
Half ordinary rate, *Rennie* - - - 1696
Reduction advocated, *Jagger* 1226–33, 1285–8
Restrictions, and abolition of certain, advocated, *Hannam*, p. 86 ; *Orr*, 1567–9, 1574, 1590–1.
System, *J. Wilson* - - - - - - 1157
new Traffic created by, *J. Wilson* - 1172–3
Traffic statistics, 1912, 1913, *J. Wilson* p. 84–5
Used probably more by private individuals than commercial houses, *Orr* - - - 1596–7
Value of, *Smartt* - - - - - - 1316
Improvement, more rapid postal service more important, *Dunlop* - - - - - - 1719–23
Lines, number of, *J. Wilson* - - - 1176–80
Night, not considered, *J. Wilson* - - - 1171
PRESS :
Direct communication between Dominions desirable, *Park* - - - - - - - p. 87
Rates, reduction, and benefit of, *Park*, p. 87 ; *J. Wilson*, 1157.
RATES :
Decrease, *J. Wilson* - - - - - - 1157
considered Reasonable, but reduction would be welcomed, *Smetham* - - - - 1616–7
Reductions :
Benefit of, *Smartt* - - - - - - 1316
Further :
would not be Advocated if extra burden on taxpayer involved, *Smetham* - 1631–3
Desirable - p. 81 ; *Orr*, 1561–3, 1572–3
Question of extra working expense, *J. Wilson*, 1167, 1188–90 ; *Smartt*, 1338–9.

Cables—*continued.*
Receipts, decrease in, largely due to want of activity in mining market, *J. Wilson* - - 1183–7
Service satisfactory and ordinary code rate approved, *Jagger* - - - - - - - - - 1226
Subsidy to Eastern and South African Cable Co. owing to revenue not reaching 300,000*l.* per annum, *J. Wilson*, 1157–8 ; *Jagger*, 1285–6.
WEEK END :
Advantages, *Anstey* - - - p. 82 ; 1733–42
with Australia, not considered, *J. Wilson* 1181–2
Delivery on Monday :
no great Advantage, *Orr* - - 1564–5
would be Beneficial, *Jagger* - - - 1232
Experiment successful, but reduction of minimum would enhance value to general public, *Park* p. 87
Facilities :
well Advertised, and use of, growing, *J. Wilson* 1166–9
Commercial community well informed of, but not general public, *Smetham* 1627–30, 1634–7
not sufficiently Well known among general public, *Smartt*, 1319–24, 1327–8 ; *Dunlop*, 1709 ; *Anstey*, 1750–2, 1760–2.
Well known among business people, *Dunlop* 1714
Figures and code should be allowed, *Johannesburg Chamber of Commerce* - - - - p. 82
Gain to Cable Co., *Rennie* - - - - 1695
Increased use of, by general public desirable, *Smetham* - - - - - - 1636–8
Minimum rate, reduction :
would be Advantageous, *Smartt* 1317–8, 1325–6
Advocated, and suggestions *re* rate, *J. Wilson*, 1174–5 ; *Jagger*, 1226–33, 1285–8 ; *Smartt*, 1361–2, 1410–4 ; *Orr*, 1561–3, 1566, 1573–4 ; *Smetham*, 1602, 1607, 1610–5, 1618–22 ; *Rennie*, 1696, 1702, 1703, 1706–8 ; *Dunlop*, 1711–3 ; *Johannesburg Chamber of Commerce*, p. 82 ; *Hannam*, p. 86.
Competition with deferred messages not anticipated, *Smetham* - - - - 1608–9
at Present rates, cable companies would benefit, *Smetham* - - - - - 1623–6
Use would increase, *Jagger*, 1231 ; *Orr*, 1575–88 ; *Smetham*, 1602–6, 1622 ; *Anstey*, 1754–9.
if Non-existent many messages would not be sent at all, *Orr* - - - - - - 1598–9
Payment for service instructions resented by some people, *Dunlop* - - - - - 1709
Place of post and code messages taken by, and great use made of, both for business and private purposes, *Rennie* - - - - 1687–708
Post being taken place of by, *Anstey* 1733, 1735, 1755
for Press purposes, scheme, *Park* - - p. 87
System, *J. Wilson* - - - - - - 1157
Telegraphing of, all the way, would be an advantage, and advocated, *J. Wilson*, 1174–5 ; *Jagger*, 1231 ; *Orr*, 1592 ; *Smetham*, 1639–41 ; *Hannam*, p. 86.
new Traffic created by, *J. Wilson*, 1172–3 ; *Rennie*, 1700–2 ; *Dunlop*, 1714 ; *Anstey*, 1732, 1763–5.
Traffic statistics, 1912, 1913, *J. Wilson* - p. 84–85
Used mainly by business community, *Hannam*, p. 86 ; *Orr*, 1579–80 ; *Dunlop*, 1709.
Value of, *Smartt* - - - - - - 1316
Caledon, development due to railway, *Stephen* 4009–10

Canada :
Assistance received by Pretoria research department from, *F. B. Smith* - - - - - 3759–61
Fruit export to, possibility of development, *Pickstone* 6607–24, 6748–50
Canned goods, rates from London, New York, and St. John, *Jagger* - - - - - 1248–9

Cape Province :
Agricultural produce, comparative return, 1865–1911, *Moffat* - - - - - - - - - p. 271
Agriculture, *see that title.*
Area of desert land in, possibilities of development, *Holland* - - - - - - - - 485–500
Coal, *see that title.*

Cape Province—*continued.*
Cotton, *see that title.*
Dairying, *see that title.*
Fruit industry, *see that title.*
Government reserves, and breeding of jackals and vermin in, which destroy crops and stock, *Mackay* 443–9
Irrigation, *see that title.*
Kaffir settlement at Debe Nek, *Brabant* 4580–2, 4608–12
Land, *see that title.*
Livestock, comparative return, 1865-1911, *Moffat* p. 271
North-Western district, development possibilities, *Stephen* - - - 3964–94, 4012–20, 4048–50
Poor white settlements, Arbeids Kolonie, near Aliwal North, under Dutch Reformed Church, *Holland* - - - - - - - - p. 25
Railways, *see that title.*
Tobacco, *see that title.*
Wheat and grain, *see that title.*
Wine industry, *see that title.*
Wool, *see that title.*

Cape Town (Table Bay):
AUSTRALIAN TRADE:
Bulk of outward steamers bunker at, and homeward at Durban, *Leefe*, 2023–4; *Cook*, 2116–8; *Williams*, 2812–7.
Encouragement desirable and question of methods, *Leefe* - - - - - - - 2019–29
Increasing amount, *Hoy*, 1553; *Nicholson*, 1922–3, 1934–7; *Leefe*, 2014.
Reasons for calling, *Nicholson* - - 1900–7
Tonnage of steamers calling, and amount of dues collected, and tonnage of coal bunkered, 1912, 1913, *Hoy* - - - - - - p. 85–6
60 or 70 per cent. of outward Australian trade goes by Cape, *Leefe* - - - 2015–7
BUNKERING:
Advantages of Durban for majority of ships, Cape Town trade will largely depend on passenger vessels to Australia and New Zealand, *Smyth* p. 156
Amount, 1913, *Leefe* - - - - 1960–3
Australian trade, *see that title above.*
Big line of steamers to Cape and Australia could be sufficiently provided for, *Smartt* - 2183
Charges for landing and re-shipping coal formerly, *Cook* - - - - - - - p. 97
Charges for removal from carrying ship to buying ship, *Williams* - - - - - p. 149
Class of steamers, *Cook* - - - 2147–8
Coal too expensive and suggestions *re* decrease in price, *Cook* - - - - - - p. 98
by Coaling Company formerly, particulars *re* working of, profits made, &c., and reason for going out of trade, *Cook*, p. 97–8, 2048–170; *Spilhaus*, 2219–26, 2252–9.
Combine, duty of State to prevent, *Smartt*, 2176, 2178
Combine proposed formerly, with scheme for coal elevators, &c., but matter dropped, though advantages would have been derived, *Spilhaus* 2232–9
Commendation for prompt bunkering received, *Hoy* - - - - - - - - 2584
Competition with other ports, *Leefe*, 1996–8; *Jagger*, 2173; *Cook*, p. 98, 2162–5; *Wiener*, 2194–5; *Lerchen*, 2661–3.
Contracts, particulars *re*, *Leefe* - 1999–2002
Cost of coal bunkered, comparison with Durban and Port Elizabeth, *Buchanan*, 1645, 1661–3; *Nicholson*, 1944–6.
Cost to be reduced by additional appliances, *Hoy* 2582–4
Delays in loading steamers at Durban and proposed remedy, *Spilhaus* - - 2227–31, 2242–9
Discharging of colliers too slow, *Spilhaus* 2231–2
English coal, decreasing quantity, *Williams* 2897
Facilities might be improved in some directions, *Jagger* - - - - - 2171, 2172, 2174
Facilities offered as bunkering port compared with Durban, *Williams* - - - p. 152
Facilities and methods and room for improvement, *Leefe*, 2007–13; *Cook*, 2136–8.

Cape Town (Table Bay)—*continued.*
BUNKERING—*continued.*
Firms engaged in, *Leefe* - - - 1995–6
Flat railway rate, advantage of, but attacked owing to local jealousies, *Wiener* - - 2192
Freight paid to Union Castle Co. for carrying coal to, from Durban, 1910–14, *Williams*, p. 152, 2822, 2825–7
Government encouragement of trade, *Cook* 2143
Government system of coaling, and approval, *Cook* p. 98, 2070–6
History of, *Cook* - - - p. 97–8, 2058–9
Increase, question of possibility, *Cook*, p. 98; *Williams*, p. 149.
Natal Coal:
not Brought overland, *Cook* - - - 2057
Chartering of vessels to take coal to Cape Town, question of, *Williams* - - - 2871–4
Comparison with Transvaal coal, *Nicholson*, 1947; *Leefe*, 1964–82; *Cook*, p. 98, 2066–7, 2090–3, 2129; *Jagger*, 2173; *Hoy*, 2380; *Lerchen*, 2669–72.
Competition with Transvaal coal, *Cook*, p. 98; *Wiener*, 2193; *Williams*, p. 149, 2898, 2900.
Cost of carriage of coal, and comparison with cost from Transvaal, *Wiener*, 2209–13; *Spilhaus*, 2225–7.
Higher cost at Cape Town than at Karachi doubted, *Leefe* - - - - 1982–4
Increase in price, *Leefe* - - - 1971–3
Natal collieries should have depôt and sell their own coal, and price at which coal could be sold, *Cook* - p. 98, 2067–76, 2079–86, 2128, 2160
Preferred, but in hands of only one firm now owing to competition of Transvaal coal, *Spilhaus* - - - - - - - 2240
Railway rate from pit-head to Durban, *Leefe* 1974–81
Transport from Durban no monopoly, but competition with South African collieries, *Leefe* - - - - - - - 1987–8
Possibilities, *Nicholson* - - - 1924–6
Prices:
Comparison with Durban, *Nicholson*, 1944–7 *Leefe*, 2003–6; *Williams*, p. 152.
Decrease, *Jagger* - - - - 2172, 2175
considered Fair, *Spilhaus* - - - 2250
Particulars, *Leefe* - - - - 1960
20*s.* aimed at, *Wiener* - - 2194, 2205–9
21*s.*, possibility of, and details, *Cook* - 2067–76, 2079–86, 2140–2
probable Proportion of Natal and Transvaal coal in 1914, 1915, *Cook* - - - - 2088
Railway rates:
Cheap rate to, and reason for, *Hoy* - 2523*a*–4, 2543–9
Low rate from Transvaal:
not Justified, *Abercrombie* - - 3118–23
to Prevent excessive prices, *Smartt* 2179–82
Reduction by Government after inquiry, *Cook* 2056
Rates from Transvaal and Natal, *Leefe*, 2030–5, 2037; *Williams*, pp. 153–4, 2836–74, 2899; *Bekenn*, p. 146.
from Transvaal, reduction, *Cook*, 2143, 2146; *Hoy*, 2484.
Undue advantage given to Transvaal collieries, *Williams* - - - - - p. 151–2
Steamers never kept waiting up to end of 1913, *Leefe* - - - - - - - - 2013
any Steps by Government to develop trade and prevent putting up of price approved, *Smartt* 2186–8
Storage bins needed, *Cook* - p. 98, 2133–5
Stores of coal, quantity, *Cook* - - 2139–9*a*
Trade could be increased with cargo traffic, *Cook* 2149–50
Trade affected by cost of coal *Cook* 2153–4
Transvaal coal:
present Combine controlled by Sir John Ellerman, *Spilhaus* - - - - 2259

Cape Town (Table Bay)—*continued.*
BUNKERING—*continued.*
Transvaal coal—*continued.*
Comparison with Natal coal, *Nicholson*, 1947; *Leefe*, 1964–82; *Cook*, p. 98, 2066–7, 2090–3, 2129; *Jagger*, 2173; *Hoy*, 2380; *Lerchen*, 2669–72.
Competition with Natal coal, *Cook*, p. 98; *Wiener*, 2193; *Williams*, p. 149, 2898, 2900.
Cost of carriage of coal, and comparison with cost from Natal, *Wiener* - - 2209–13
less Handled, and less broken up than Natal, *Wiener* - - - - - - 2210, 2212
Price, *Wiener* - - - - - - - 2192
Reduction of price not probable, *Smyth* p. 156
by Union Castle Co., amount, 1913, *Leefe* 1989–93
Union Castle Co. no longer in trade, *Leefe* 1994, 2045
Welsh coal formerly, *Cook* - - - p. 97
Chamber of Commerce, President, *see* Jagger, J. W.
COAL:
Bunkering, *see that title above.*
Import, *Hoy* - - - - - - - 2377
Import from United Kingdom:
decrease since Development of bunkering of Natal coal, 1911–1913, *Williams* - - p. 149
Price paid by factories for, and details, *Cook* 2102–8, 2113
Development, possibilities, *Wiener* - - 2190
FREIGHT RATES:
Comparison with East London, *Lerchen* 2680–94
from Europe, highness of, and comparison with Argentine and Australia, *Wiener* - 1437–8, 1449–51
Rates to Durban complained of, compared to, *Buchanan, Butcher* 1645, 1661–3, 1671, 1676–9
HARBOUR:
Accommodation, *Nicholson* - 1887, 1894–5
Bunkering, *see that title above.*
Breakwater extension, proposed scheme, and non-carrying out of, *Nicholson* - - 1948–9
Capital expenditure, present charges and revenue, p 158
Deepening possibilities, *Nicholson* - 1908–15
Deepening and improvement of quay accommodation desirable, *Smartt* - - - 2177
Deepening to 40 feet and provision of accommodation for vessels of 1,000 feet, question of possibility - - - - - - - p. 159
Dimensions, depth of water, and rise and fall of tide - - - - - - - p. 157
Dry dock, accommodation, *Nicholson* - - 1938
Dues:
not Affected by increased expenditure, *Nicholson* 1928–33
Decrease and increase of facilities, &c., *Jagger* 1290
System, *Jagger* - - - - - - 2171
Expenditure and revenue, 1912, details - p. 160
Foreshores unsuitable for échelon arrangement of wharves - - - - - - - p. 159
Improvement schemes, *Nicholson*, 1887–93, 1896–9, 1915–21, 1927–33, 1950–6; *Wiener*, 2196–204; *Hoy*, 2557*a*–62.
Size of largest vessel that can be berthed and repaired - - - - - - - p. 158
Total capital expenditure at 31st December 1913, *Hoy* - - - - - - - - p. 110
Mohair export, *van Breda*, 3471, 3491; *Oxenham*, 3561.
Ostrich feather export through, *Liberman* 3279, 3386
Outlet for Transvaal coal, *Jagger* - - - 2171
Railway to Johannesburg, length, gradients, &c., *Hoy* - - - - - - - - - p. 108
Wool export from, *see under* Wool.
Carriages, rates from London, New York, and St. John, *Jagger* - - - - - - 1248–9
Castle Steamship Co., strong financial position of, *Smartt* - - - - - - - - - 1344

Cattle Industry:
Abattoirs, public, in large towns, but no systematic inspection of animals slaughtered at, *Gray* 5557–8
Assistance received from Holland, America, and Canadian societies but not from British, *Johnston* 4759–60

Cattle Industry—*continued.*
Cape Province, numbers, 1865–1911, *Moffat* - p. 271
Combination with maize cultivation, possibility p. 269, p. 270
Dipping, *see under* Diseases of Animals.
East London district, development hindered by east coast fever and heart water among sheep, but improved prospects as result of dipping, *Gray* 5596–7
Friesland, import, *Johnston* - - - - 4759
Import, cost of bringing animals out, *Woollatt* 5306
Improvement in breed, *Baynes* - - - 5338
NATAL:
Farms not fully stocked on the whole, *Woollatt*, 5325; *Marwick*, 5325, 5327.
Improvement in class of, *Scott* - - 5296–8
Large import, *Scott*, 5292; *Marwick*, 5302.
Newcastle district, increasing since introduction of dipping, *Jones* - - - - - - p. 266
Number, 1904, 1911, *Moffat*, 5507–10; *F. B. Smith*, p. 177.
Prospects of, owing to decrease of disease, *Scott*, 5264; *Woollatt*, 5303.
Winter feed grown, *Woollatt* - - - 5328
ORANGE FREE STATE:
Country overstocked with wrong type, *Johnston* 4781
Numbers, 1880–1911, *Moffat* - - - p. 272
Parts too highly stocked but others could carry more, with boring for water, *Gasson* 4703–5
Prospects, *Van Zijl* - - - - - p. 271
Types, *Johnston* - - - - - 4804–10
small Profits compared with ostrich farming, *Holland* - - - - - - - - - 4485
Prospects, *Van Zijl* - - - - - p. 271
Pure bred, large import since free freight allowed, *Holland* - - - - - - - - 4466
Ranching scheme, Southern Rhodesia, by Liebig Company referred to, *Kleinenberg* - - 5725
Slaughtering, continuance of, by Government, when dipping might have been used, *Baynes* 5369–70
Springbok Flats district, good condition of, *Haarhoff* - - - - - - - - - 1017
Stud cattle, sales by Government, *Johnston* 4859–61
Sura, nearly brought in with camels, *Scott* - 5264–7
TRANSVAAL:
Best breeds, experiments advocated to determine p. 254
Co-operation among farmers to secure better prices, may come in future - - - p. 255
Foreign breeds, names of - - - - p. 254
Improvement in quality, *Doyle* - p 254; 5606
Increase since war, *Robertson* - - - 5638
Particulars *re*, *Madge* - - - - p. 52
Prospects, *Madge*, p. 51, p. 52, p. 271; *Doyle*, 5608.
Tendency among less progressive farmers to use nondescript sires - - - - - - p. 254
Tuberculosis, *see under* Diseases of animals.
Type rich in butter fat desirable, *Gasson* 4753–6
Types, *Johnston* - - - - - 4755–6, 4851–2
WINTER FEED:
not Grown in many parts, *Woollatt* - 5329–30
Importance of, and more stock could be carried, *Woollatt* - - - - - - p. 270; 5334

Cement:
Railway rates and sea rates, *Vintcent* - 1219–20
Rates from London, New York, and St. John, *Jagger* - - - - - - - - 1248–9
Rates to Mossel Bay, complaint *re*, as compared with rates to other ports, *Vintcent* - 1201–20
Reduction of railway rates, 1912, *Hoy* - 2440
Traffic carried on railways, 1912, 1913, *Hoy* p. 147; 2478

Ceylon, *see* India and Eastern ports.
Chairs, rates from London, New York, and St. John, *Jagger* - - - - - - - - - 2248–9

Cheese:
Production, statistics, Cape Province and Orange Free State, *Moffat* - - - p. 271, p. 272
Traffic carried on railways, 1912, 1913, *Hoy*, p. 147, 2478

Chemistry, expenditure on, by Department of Agriculture, 1913, *F. B. Smith* - - - - p. 176

China, trade with, in ostrich feathers desired, and steps taken to encourage, *O. Evans* - 4411–4
Citrus fruit, *see under* Fruit Industry.

Clan Line:
Differential treatment against shippers not signing agreement, *Jagger* - - - - - - 1254
Service to the East *viâ* S. Africa and back *viâ* Suez Canal, *Wiener* - - - - - - - 1440
Closer settlement, *see under* Land and Land Settlement.
Clothing, rates from London, New York and St. John, *Jagger* - - - - - - - - - 1248–9

Coal:
Bunker, price at present and in 1890, *Wiener* 1521–3
BUNKERING:
See also under particular ports.
Rate would be higher at Aden and Port Said than at South African ports, *Cook* - - 2119–20
Bunkering and export, total amount disposed of for, 1911, 1912, 1913, *Smyth* - - - - p. 155
Cape Province, output, 1912, *Smyth* - - p. 155
COKE:
Output, 1912, *Smyth* - - - - - p. 155
Traffic carried on railways, 1912, 1913, *Hoy*, 2481–4, p. 148
EXPORT:
Countries of, *Smyth* - - - - - - p. 155
Low railway rates, *Hoy* - - - - - 2437
Total amount, 1911, 1912, 1913, *Smyth* - p. 155
Export from United Kingdom, details, Jan. 1912, 1913, 1914, *Williams* - - - - - p. 150
Import, *Hoy* - - - - - - 2376–7
Mines, acquisition by Government advocated, *Wiener*, 1502
NATAL:
Annual output, 1910–1913, *Williams* - p. 148, 2775
Bin accommodation at collieries and port, objection to increase owing to breakage caused by double handling, *Smyth* - - - p. 155
Bunkering, *see under* Cape Town *and* Durban.
Coalfields, *Smyth* - - - - - - p. 155
Coal Owners' Society, *Siedle* - - 2918–22
Combine of collieries and agreement with Union Castle Co.:
Benefit to industry generally, *Siedle* - 2929
Broken up by Government reducing railway rate on coal from Transvaal, *Hoy* - 2544–9
Collieries outside and output of, *Smyth* p. 156
Combination would not be objected to, if sale not confined to one buyer and if minimum price fixed, *Cook* - 2060–5, 2077–9, 2155–6
Effect on price and trade, *Leefe*, 1985–6; *Cook*, 2049–55, 2109–15, 2125–7, 2132; *Wiener*, 2214–7; *Spilhaus*, 2250–1; *Siedle*, 2926.
Explanation, *Leefe* - - 1986, 2042–4
Explanation of objects, &c., *Siedle* - 2921–30
Government opposed to, *Cook* - - 2146
alleged Grievances, *Williams* - - p. 149
Particulars *re*, *J. Wilson*, 1191–8; *Leefe*, p. 59; *Cook*, p. 98, 2049–55, 2121–4, 2130–2; *Jagger*, 2175; *Williams*, 2823–5, p. 149–50; *Smyth*, p. 156.
Prices moderate, *Williams* - - 2867–8
Reasons for, and results, *Williams*, p. 149, p. 150
Reduction of railway rates through, *Siedle*, 2928–9
previous Combination, vessels chartered to take coal to Cape Town, *Williams* - - - 2871
Comparison of, with Transvaal coal, *Nicholson*, 1947; *Leefe*, 1964–82; *Cook*, p. 98, 2066–7, 2090–3, 2129; *Jagger*, 2173; *Hoy*, 2380; *Lerchen*, 2669–72.
Competition, effects of, *Smyth* - - - p. 156
Competition, 1910–12, and effect on prices, *Williams* - - - - - - p. 149–50
Conveyance to coast:
Conditions and methods of discharging wagons, *Williams* - p. 150–1, 2800–1, 2860–4, 2890–3
Construction of duplicate route desired and benefits to be derived, *Williams*, 2802, 2893–6; *Young*, 3016–8; *Smyth*, p. 156.
Delays, *Williams* - - - p. 151, 2840–3
no Demurrage charge, *Williams* - 2834, 2844–6

Coal—*continued.*
NATAL—*continued.*
Conveyance to coast—*continued.*
Railway improvements required, *Williams*, p. 151, 2853–66
Storage accommodation, lack of, *Williams* p. 151, 2830–1
Time taken, *Williams* - - - p. 150–1
Time taken and detention of trucks at Durban, *Smyth* - - - - - - - p. 155
for Export, and for local consumption, railway rates to Durban and grievance *re*, *Leefe* - 2036–41
Export:
Analysis of trade, 1913, *Williams* - - p. 148
to Cape Province, 1911, 1912, 1913, *Williams*, p. 149
for Cape railways formerly, *Williams* - p. 149
to India and Eastern ports, *Weiner*, 1443–4, 1524; *Butcher*, 1658–60.
to Karachi, *Leefe* - - - - - 1983
Markets, and competition, *Williams* - p. 150, 2803–6
Prices at Bombay, and comparison with Bengal and Cardiff coal, 1907, 1908, 1909, *Williams* p. 150
Railage, preference to export trade, *Cook* 2070–2, 2099–102
Increase of production, possibility of, with regular supply of rolling stock, and adequate native labour, *Williams* - - p. 149, 2776–8, 2791
Output:
1913, *Leefe* - - - - - - 1986
of Coal and coke, 1912, *Smyth* - - p. 155
Increase, assistance by Government as regards railway rates needed, *Bekenn* - - p. 146
Port charges on shipment, *Williams* - - p. 151
Prices:
f.a.s. at Durban, 1907–14, *Smyth* - p. 155–6
Increase, not entirely due to Combine, *Smyth* p. 156
Increase 1913–14, not due to Union Castle Co., *Smyth* - - - - - - p. 156
Proportions taken for bunkers, export, railways and harbours, and inland consumption, *Williams* 2788–90, 2838–9
Quality, and comparison with Welsh coal, *Williams* 2819–21
Railway rates:
for Bunker and export coal, and dissatisfaction, impossibility of entering South American market with, *Williams* - - 2792–9
on Coal for shipment, to Durban, *Williams* p. 152
to Different ports from all collieries, and comparison with Transvaal and Orange Free State, *Williams* - - - - p. 153–4
Dissatisfaction *re*, *Williams* - 2886–9, 2901–6
Lower, for export, approved, but middlemen, not consumer or collieries get benefit, *Cook* 2168–9
Reduction necessary to enable competition with other countries in Indian and Eastern market, *Bekenn* - - - - - - - p. 146
Sale for inland consumption at low price at pit's mouth, *Williams* - - - - 2869–70
one Shipment to South America, and loss on, *Williams*, 2901–6; *Siedle*, 2908.
Storage accommodation, *Williams* 2847, 2851–2
Strike, effect of, *Young* - - - - 3015
Supply taken by Admiralty, *Williams* 2832–3
ORANGE FREE STATE:
Output, 1912, *Smyth* - - - - - p. 155
Railway rates to different ports, and comparison with Natal and Transvaal, *Williams* p. 153–4
Output, 1912, *Smyth* - - - - - p. 155
PRICES:
at Bombay, 1913, *Williams* - - - p. 150
Increase all over the world, *Smyth* - - p. 156
Railway rates and question of further reduction, *Hoy* 2482–4, 2523*a*, 2555–7, 2563–4
Railway rates, coal for inland consumption, *Williams* p. 152–3
Traffic carried on railways, 1912, 1913, *Hoy* p. 148, 2477, 2481

Coal—*continued.*

TRANSVAAL:

Bunkering, *see under* Cape Town.

Coalfields, *Smyth* - - - - - p. 155

Combination of coalowners to supply railways in India, *Wiener* - - - 1440–2, 1475–6

Comparison of, with Natal coal, *Nicholson*, 1947; *Leefe*, 1964–82; *Cook*, p. 98, 2066–7, 2090–3, 2129; *Jagger*, 2173; *Hoy*, 2380; *Lerchen*, 2669–72.

Output of coal and coke, 1912, *Smyth* - p. 155

Railway rates:

on Coal for shipment, to Lourenço Marques, *Williams* - - - - - p. 152

to Different ports from all collieries, and comparison with Natal and Orange Free State, *Williams* - - - - - p. 153–4

Coke, *see under* Coal.

Competitive area, too large proportion of total railway revenue and total revenue of the Government paid by, *Robinson*, 3189, 3208, 3230, 3243–6; *Soutter*, 3189.

Continent, freight rates from, same as from England. *Jagger* - - - - - - - - 1248

Co-operation, expenditure on, by Department of Agriculture, 1913, *F. B. Smith* - - - - p. 176

Co-operative societies, particulars *re* systems, working of, &c., *F. B. Smith* p. 177, 3776–9, 3827–8, 3835–9

Corrugated iron sheets, rates from London, New York, and St. John, *Jagger* - - - - 1248–9

Cost of living, highness of, *M. S. Evans* - - 805

Cotton:

Amount to be planted next year, *Scherffius* 5993–4

considerable Areas suitable for, *R. R. Smith* - p. 284

Boll worms, *Browne* - - - - - 5877–8

CAPE PROVINCE:

Pests and apparent non-suitability of soil and climate, *Woodhead* - - - 5726, 5730

Supply of seeds to farmers, 1910–11, and results, but little success, *Woodhead* - - 5726–35

Coastal area in native territories the best area for, but land not available for white men, *Browne* 5754–6, 5799–801

Coastal belt from Port Elizabeth to Natal should be excellent district, *R. R. Smith* p. 283–4, p. 285

Comparison with citrus fruit, *Scherffius* 5997–8

Cost of growing one acre, and return, *Scherffius* 5971–6

Crop, increase, *Scherffius* - - - - p. 280

Difficulties and drawbacks, *F. B. Smith*, 5742; Transvaal Agricultural Union, p. 286, *Browne*, pp. 329–30

certain Districts suitable for, *F. B. Smith*, 5752–2*a*; *R. R. Smith*, p. 285.

EAST LONDON DISTRICT:

Advice to farmers, expert at East London, *Browne* 5811–3

"Anglers' Home" Farm, (Chalumna Cotton Plantations), particulars *re*, *Garnett* - - p. 285

Association, scheme for formation, *R. R. Smith* p. 283–4, p. 285

Chalumna Cotton Plantations, report on first crop of cotton at, *Browne* - - - pp. 329–30

"Chopping," explanation, *Browne* - - 5888

Climatic conditions and suitability of, *Browne* 5753, 5784–92

Cost of land, *Browne* - - 5802–3, 5840

Experiments, *F. B. Smith* - - - 5748–50

Labour, no difficulty anticipated, wages, &c., *Browne* - - - 5753, 5770–4, 5839, 5874–5

Land available, question of, *Browne* - 5803–6

no exceedingly Large area suitable for, but farms could devote portion of land to, *Browne* - 5757–8, 5848–52, 5814–9

Nature of soil and preparation of, before planting, *Browne* - - - - - - - 5760–6

Particulars *re*, area, &c., *Browne* - 5753–5759

Pests, but no great trouble with, *Browne* - 5826–31, 5885–7

Picking date, *Browne* - - 5879, 5902–3

Planting season, *Browne* - - - - 5785

Ratooning, *R. R. Smith* - - - - p. 284

Reasons for previous abandonment of, *Brabant* 5904–5

Small farmers will probably take to, *Brabant* 5908–9

Cotton—*continued.*

EAST LONDON DISTRICT—*continued.*

Success of, formerly, but discontinuance on price going down, *Browne* - 5808–10, 5820–2, 5826–7

Varieties planted, *Browne* - - - 5775–83

Establishing of crop the only difficulty, *Scherffius* 5931

Expenses, question of, *Browne* - - 5837–8

EXPERIMENTS:

by Cotton Growing Association, *F. B. Smith* 5748–50

by Department of Agriculture, *F. B. Smith* 5751–2

Made, but judgment impossible at present as to profitableness of - - - - - p. 286

in Pondoland, *F. B. Smith* - - 5744–7

Work should be done by Government, farmers will not take up, *R. R. Smith* - - - p. 284

Expenditure on, by Department of Agriculture, 1913, *F. B. Smith* - - - - - p. 176

EXPORTS:

not a Commercial quantity, *F. B. Smith* - 5742

Sample lots only, *Browne* - - - 5899–901

Farmers anxious for information *re*, *R. R. Smith* p. 284

Farmers taking up experiments, *Scherffius* - 5977, 5983

GINS:

in East London, *Woodhead*, 5735–8; *Browne*, 5856–9.

Facilities, *Scherffius* - - - p. 280, 5950–1

no Government assistance beyond expert at East London, *Browne* - - - - 5867–9

Gradual introduction in small lots of 10–20 acres on each farm advocated, *R. R. Smith* - - p. 285

Guaranteed price would assist in establishment of crop, and arrangement with British Cotton Growing Association as in Australia would be useful, *R. R. Smith* - - - p. 284, p. 285

Increasing interest in, *Scherffius* - - - p. 280

King Williamstown district, great deal of land suitable for, *Browne* - - - - - 5805

LABOUR:

Cost, comparison with southern States of America, *Scherffius* - - - - - 5999–6003

Importance of - - - - - - - p. 286

for Picking:

no Difficulty anticipated, on the whole, *R. R. Smith* - - - - - - p. 284

Natives, slowness of, wages paid, and comparison with America, *Scherffius* - - 5929–30

Plenty of, but slow, *Scherffius* - - - 5929

Question of, *F. B. Smith* - - - 5742–3

Texas, *Browne* - - - - - 5870–2

LAND:

Plenty available at profitable price, *Browne* 5841–3

Price, comparison with America and Egypt, *R. R. Smith* - - - - - - p. 285

Large plantations not possible, but plots of 10–50 acres, *Browne* - - - - - 5844–7

Lichtenburg, question of suitability, *Scherffius* 5979–80

Market anticipated and fair price, *Browne* - 5835

Native cultivation, possibility, *R. R. Smith* - p. 284

by Natives on own lands, not probable, *Browne* 5862–6

Non-success, causes, *Scherffius* - - - p. 280

Oil cake, value of, *R. R. Smith* - - - p. 284

Peddie district:

Success formerly, *Browne*, 5820; suitability of, *R. R. Smith*, p. 285.

Pests, *Scherffius*, 6004–6; *R. R. Smith*, p. 284.

Picking, no machine yet perfected for, *Browne* 5838

Planting along with maize possible, but not recommended, but suits native farmers, *R. R. Smith* p. 285

at Port St. John's, experiments and results, *Browne*, 5754–6, 5793–6, 5881; *R. R. Smith*, p. 284.

Preparation of land, method, *Scherffius* - 5914–6

Prices, *Browne*, 5894–7; *Scherffius*, 5925–7, p. 280; *R. R. Smith*, p. 284.

PRICES:

Comparison of American and Egyptian, *R. R. Smith* - - - - - - - - p. 285

Increase, *Browne* - - - - - 5823–5

in London, comparison with American cotton, *Browne* - - - - - - - - 5753

Cotton—*continued.*
large Production possible in future, but dependent on farmers, *Scherffius* - - - - 6007
Profitableness of:
Comparison with tobacco, cost of labour, &c., *Scherffius* - - - - 5946–9, 5988
Comparison with mealies, *Scherffius* 5996, 5977, 5982
Prospects, *Scherffius* - - - - - 5977
Ratoon cotton, question of, *Browne* 5789–90, 5876
RUSTENBURG DISTRICT:
Annual variety grown, *Scherffius* - - 5959

Transport to factory by railway, distance, rates, &c., *Baynes* - - - - 5339–42, 5415–33
Encouragement of, instead of export of maize, question of, *Bourke* - - - - - 5447–8
Expenditure on, by Department of Agriculture, 1913, *F. B. Smith* - - - - - p. 176
Government assistance, one successful dairy only, *Baynes* - - - - - - - 5347–8
Import, explanation, but prospects of development, *Bourke* - - - - - - 5444, 5447, 5448
Individual effort (such as Joseph Baynes) considered better than large co-operative schemes, *Bourke* 5493–4
MILK:
Import:
Reason not known, and possibility of producing sufficient for requirements, *Gasson* 4751–3
Value, 1907, 1912, *F. B. Smith* - - p. 177
Possibility of production of sufficient for requirements, *Johnston* - - - - - - 4763
NATAL:
Dairying helped by co-operative societies, *F. B. Smith* - - - - - - - - 3839
High price of land, *Baynes* - - 5395–7
Newcastle Creamery, Natal, particulars *re*, *Jones* p. 267
NEL'S RUST FARM DAIRY:
Output from butter factory, 1902, 1909, 1913, *Baynes* - - - - - - - - 5335–8
Particulars *re*, *Baynes* 5339–45, 5347, 5351–9, 5373–89, 5398–401, 5414–33
Source of supplies, *Baynes* - - - 5339–40
Started 1899, *Baynes* - - - - - 5335
Orange Free State, Harrismith, dairy, *Baynes* 5336
Oudtshoorn district, small amount of, and possibilities, *Edmeades* - - - - - 4194–295
Pig industry and bacon factory desirable in connection with dairy, *Baynes* - - - - - 5359
Prospects of, *Scott*, 5264; *Woollatt*, 5304; *Baynes*, 5338; *Bourke*, 5482; *Gray*, 5598.
TRANSVAAL:
Butter, large production about 1870, and subsequent dying out of, *Bourke* - - - - - 5466
Co-operation, tried, but people inexperienced, and went too quickly, *Bourke* - - 5492–4
Dairies, *Haarhoff* - - - - - - 5495
Dishonest practices - - - - - - p. 254
Doubt as to profitableness of - - - p. 254
Profitable at present, and will become more so, *Doyle* - - - - - - - - 5605, 5608
Prospects, *Bourke* - - - - - 5465–8
Tweespruit Dairy, Orange Free State, only successful dairy assisted by Government, *Baynes* 5347–9
Value of land at which dairying profitable, question of, *Baynes* - - - - - - 5402–8
Date farming, prospects, *MacDonald* - - p. 269
Debe Nek Kaffir settlement, Cape Province, *Brabant* 4580–2, 4608–12

Delagoa Bay:
Accommodation, depth, &c., *Abererombie* - 3173
AGREEMENT *re* FIXED PROPORTION OF TRAFFIC:
Awkwardness of, and abolition desired, *Abercrombie*, 3092–111, 3126–9, 3131–42, 3148–68; *Robinson*, 3194–9; *Chappell*, 3226–8, 3253–6, 3256.
Certain points of agreement to be revised during next three months, *Abercrombie* - - 3130
Terms could be observed and railway freight be on lower basis, *Chappell* - 3200–3, 3229
Willingness to revise agreement on all sides, *Abercrombie* - - - - - - - 3130
BUNKERING:
Competition with Durban, question of, *Smyth*, p. 156; *Cook*, 2167.
Trade, *Abercrombie* - - - - - 3143–7
Distances to Pretoria and Johannesburg compared with distances from Durban, *Abererombie* 3092, 3125
Facilities, *Abercrombie* - - - 3111–4, 3173
Facilities and charges, comparison with Durban, *Robinson* - - - - - - - 3250–2
Importance of making fullest possible use of, from South African and Imperial point of view, *Abercrombie* - - - - - - - 3091–2

Delagoa Bay—*continued.*
RAILWAY COMMUNICATION:
Ownership, *Abercrombie* - - - 3181–5
with Johannesburg:
Length, gradients, &c., *Hoy* - - - p. 108
Rates, compared with those from Algoa Bay, *Chappell* - - - - - - - 3202
Witbank route used chiefly, *Chappell* - 3247–9
with Pretoria:
Details and comparison with communication from Durban, *Abercrombie* - - 3175–86
Rates excessive, and need for reduction, *Abercrombie*, 3107–15, 3122, 3187–8; *Robinson*, 3189.
Traffic to Transvaal, no special duties, same benefits as traffic from Union ports, *Abercrombie* - 3124
Department of Agriculture, *see* Agriculture, Department of.

Diseases of Animals:
ANTHRAX:
Cases among natives, *Gray* - - - 5576
Disposal of carcases, *Gray* - - - 5575
Increase, statistics in Transvaal, 1904–12, *Gray* 5542
among Ostriches, Grahamstown district, *Gray* 5580–2
Prevalence, causes, &c., *Gray* - 5542, 5556–8, 5571–4, 5577–9
Transmittable to human beings, cattle, sheep, and ostriches, *Gray* - - - - - 5582
Attitude of Kaffirs towards instructions *re*, *F. B. Smith* - - - - - - - - 3756

DIPPING:
Beneficial results, and farming on coast made practicable, *Dumaresq*, 4551–70; *Brabant*, 4571, 4592–601; *Woollatt*, 5302; *Gray*, 5398.
Compulsory for certain districts, but not always carried out, *Baynes* - - - 5434–9
Compulsory, and method of enforcing, *Brabant* 4602–6
Compulsory powers, extent of, more or less permissive, *Gray* - - - - - 5559–63
certain Diseases not affected by, *Gray* 5583–6
Diseases that can be satisfactorily met by, *Gray* 5587
Immunity will be lost, as ticks stamped out, *Dumaresq* - - - - - - 4565–6
Natal, particulars *re*, and eradication of tick, *Baynes* - - - - - - - 5364–9
Natives very teachable, *Gray* - - 5567–8
Newcastle district, Natal, regulations, *Jones* p. 266
Obligatory, advances by Land Bank, for erection of tanks, *F. B. Smith* - p. 176, p. 177, 3879–80
Particulars *re* dipping, cost, &c., *Dumaresq*, 4554–70; *Brabant*, 4586–8
Particulars *re* proceedings and success, *Gray* 5541
Sheep:
Beneficial results, and farming on coast made practicable, *Bock*, 4498; *Dumaresq*, 4551; *Brabant*, 4571.
Elimination of scab as result, *Fichardt* - 6150
Particulars *re*, *van Breda*, 3547–9; *Brabant*, 4589–91.
Newcastle district, regulations, *Jones* - p. 266
Tanks:
Local authorities should be assisted, where wishing to erect, on public lands - p. 259
Low rates for material, and low prices for cement - - - - - - - p. 259
Value of, *Holland* - - - - - - 4465
Value of tobacco in Oudtshoorn district for, owing to large percentage of nicotine, *Chambers* p. 191, 4319–22, 4333–5, 4344–7
Diseases, segregation of districts, *Brabant* 4606–7
EAST COAST FEVER:
Cape Province, success of measures against, *Gray* 5541
Extent of, *Gray* - - - - - - 5541
Natal, proceedings *re*, *Gray* - - - 5541
Success of measures against, and particulars *re*, in Transvaal, *Gray* - - - - - - 5541
Epizootic diseases, variety and virulence of, but success of measures against, *F. B. Smith* - p. 177

Diseases of Animals—*continued.*
GALL LAMZIEKTE:
Deficiency of feeding a possible cause, and closer settlement would remedy, *Pilkington*, 5628 *Van Heerden*, 5628–30.
Extent of, particulars *re*, question of cause, &c., *Johnston* - - 4764–6, 4769–70, 4811–25
Extent of, and experiments *re*, results, &c., *Gray* 5548–50
Investigation being carried on by Dr. Theiler, and solution will probably be found, *Van Heerden* 5618–20
Prevalence and spread of, *Van Heerden* - p. 255 5621–2
more Prevalent in dolomite formation in Transvaal, *Van Heerden* - - - - 5625–7
Symptoms, *Gray* - - - - - 5450
Referred to - - - - - - - 5542
Glanders, decrease, 1904–1912, Transvaal, *Gray* 5542

HORSE SICKNESS:
Cause, *Holland* - - - - - - 4476–7
Dipping:
Benefit not proved, *Gray* - - - 5584
Success believed in, *Baynes* - - 5369, 5370–1
Inoculation against, particulars *re*, results, &c., *Gray* - - - - - - - - 5542
Newcastle district, Natal, disease and dipping by many farmers, *Jones* - - - - p. 266
Stables with mosquito-proof netting only remedy against mosquitos, *Dumaresq* - - 4568

LUNG DISEASE OR PLEURO-PNEUMONIA:
Prevalence decreased, *Gray* - - - 5586
Success of measures against, and decrease in Transvaal, 1904–12, *Gray* - - - 5542
Records kept *re* local contagious diseases, *F. B. Smith* 3834
Reported promptly on the whole, *F. B. Smith* 3842
Reporting of, obligatory and heavy penalty attached, *F. B. Smith* - - - - - - 3829–31
Scab, stringent measures should be enforced - p. 259
Slaughtering, dependent on nature of disease, *F. B. Smith* - - - - - - - - - 3833
Steps taken as regards native states of Basutoland and Swaziland, *F. B. Smith* - - 3814–5
Steps taken by Department of Agriculture *re*, and results, *F. B. Smith* - - 3751, 3843, 3866–72
Success of measures against, extent of, *Gray*, 5540–2, 5556; *Van Heerden*, 5618, 5621.
Sura, nearly brought in with camels, *Scott* 5265–7

TRANSVAAL:
see also particular names.
Increase owing to removal of stock inspectors p. 255
Strict enforcement of regulations important p. 257–8

TUBERCULOSIS:
in Cattle from England:
Condemnations after arrival, *Johnston*, 4760–2, 4866; *Woollatt*, 5305–11; *Gray*, 5541.
Doping of animals before test, and valuelessness of certificate, *Johnston* - 4760–1, 4890–904
Doping believed to take place to some extent, but not customary among British breeders of good repute, and collusion with professional men not suspected, *Gray* - 5564–6, 5599 *note*
Quarantine station in England for testing, before export, hastening of desired, *F. B. Smith*, p. 178; *Johnston*, 4760, 4866, 4868–74, 4897; *Woollatt*, 5306, 5307–11.
Testing on other side not considered sufficient, *Johnston* - - - - - - - 4760
Extent of, as shown by testing in Cape, *Gray* 5541
Variety and virulence of, but success of measures against, *F. B. Smith* - - - p. 177, 3752
Veterinary surgeons, larger staff desirable, *Gray* 5592–4
Donkeys, number, 1904, 1911, *Moffat*, 5511; *F. B. Smith*, p. 177.
Droughts, increasing and recurring oftener, and question of reason, *Marwick* - - - 5318–20
Dry farming, *see under* Agriculture.
Duck, rates from London, New York, and St. John, *Jagger* - - - - - - - - 1248–9

Durban:
AUSTRALIAN TRADE:
Bunkering, *see that title below.*
Homeward, increase in calls at Durban, but little outward, *Butcher* - - - - - 1683–6
Tonnage of steamers calling *en route* to or from Australia, and amount of dues collected and tonnage of coal bunkered at, 1912, 1913, *Hoy* - - - - - - - - p. 85–86
BUNKERING:
Additional facilities being provided, *Hoy* - 2582
Advantages over Cape Town for majority of ships, *Smyth* - - - - - - - - p. 156
Australian ships:
Increase in trade probable in spite of Cape Town competition, *Siedle* - - - - - 2917
few Outward-bound steamers, *Williams* 2816–7
Particulars *re*, *Williams* - - - 2812–7
Coal plant, extension, *Shadwell* - - 3032–5
Competition with Cape Town, *Cook*, p. 98, 2162–5; *Jagger*, 2173.
Cost of coal bunkered, 1894, 1914, and comparison with Cape Town and Port Elizabeth, *Buchanan, Butcher* - - - - - *1645, 1661–3
Delagoa Bay competition, *Cook*, 2167; *Smyth*, p. 156.
Facilities offered as bunkering port, and prices, compared with Cape Town, *Williams* - p. 152
Increase in trade and possibility of further increase, *Williams* - - - - - - - p. 149
Price at, cheaper than at any other place in the world, *Williams* - - - - - 2835
Prices, 1910–1914, and comparison with Cape Town, *Leefe* - - - - - - - 2003–6
Rate from Natal mines compared with rate from Transvaal to Cape Town, *Bekenn* - - p. 146
Shortage in trucks, *Young*, 3019–21, 3035; *Shadwell*, 3035–6.
Steamers frequently kept waiting, *Leefe* - 2013
Storage bins at port, Government charge, *Williams* 2848–9
Storage in trucks, *Hoy*, 2343–5, 2581; *Williams*, 2781–7, 2844–52, 2878–85; *Young*, 3011–4.
COAL:
Bunkering, *see that title above.*
Shortage of railway trucks, and delays in loading steamers for Cape Town, and proposed remedies, *Spilhaus* - - - - 2227–31, 2242–9
Tonnage put into vessels for bunkers, and into steamers for export, 1913, *Williams* - 2788
Chamber of Commerce, members, *see* Buchanan, A., *and* Butcher, W.
Distances of Delagoa Bay to Pretoria and Johnnesburg, compared with distances from, *Abercrombie* 3092, 3125
Fixed proportion of traffic, awkwardness of, and disadvantage, and ports should be run on respective merits, *Abercrombie* - 3092–111, 3126–9, 3131–42, 3148–68
FREIGHTS TO:
Comparison with rates to Cape Town and Port Elizabeth, and decrease advocated, *Buchanan, Butcher* - - - 1645, 1661–3, 1671, 1676–9
Comparison with East London, *Lerchen* 2680–94
Increase, *Butcher* - - - - - 1678–9
HARBOUR (PORT NATAL):
Accommodation of vessels of 40 feet draught and 650 feet or more long, in future, *Shadwell* 2939–46
Capital expenditure, *Shadwell* - 2995–9, 3003–4
Capital expenditure, present charges and revenue p. 158
Coal supply, plenty of coal and few vessels at moment, *Young* - - - - - 3009–10
Deepening to 40 feet and provision of accommodation for vessels of 1,000 feet, possibility, cost, &c. p. 159
Depth at which safe to bring vessels in and out, *Young*, 2954–61; *Rennie*, 3086–8.
Depth, comparison with ports in Great Britain, *Rennie* - - - - - - - 3044, 3066
Depth of water on bar at low-water springs, *Young* 2952
Development, *Rennie* - - - - 3063–4

Durban—*continued.*
HARBOUR (PORT NATAL)—*continued.*
Dimensions, depth of water and rise and fall of tide - - - - - - - - p. 157
Discharging, loading, and coaling, examples of dispatch in, *Buchanan, Butcher* 1645, 1651–2
Dredging operations, *Shadwell*, 2935, 2946; *Young*, 2947–51.
Dry Dock:
Charges, *Young* - - - - - - 3023
Increase in business, *Young* - - 3024–5
Echelon arrangement of wharves, 60 per cent. of foreshore suitable - - - - - - p. 159
Expenditure and revenue, 1912, details - p. 160
Facilities and charges, comparison with Delagoa Bay, *Robinson* - - - - - 3250–2
Facilities for large ships and increase needed, *Siedle* - - - - - - - - 2917
Floating dock:
Accommodation, and inadequacy of, *Young* 2973–9, 2988–93
only Existing means of repair, *Rennie* 3069–70
45 feet of water:
Possibility of, *Rennie* - - 3044, 3065, 3085
Possibility of, with present dredging plant, *Young* - - - 2947–51, 2969–71
Government undertakes clearing of goods if desired, and cost, *Wall* 1832–3, 1858–71, 1878, 1881
Graving dock:
Advantages of, over Cape Town, *Rennie* - 3053
Custom that would be obtained, *Rennie* 3049–59
Importance of, *Shadwell*, 2972, 3000; *Young*, 2973–9, 3027.
Scheme, *Rennie* - - - 3044, 3081–4
Scheme, details, benefits to be derived, &c., *Shadwell*, 2935–46, 2972, 3000; *Young*, 2973–93, 3007–8, 3026–31.
Suitability of Durban for, importance of, and advantages to be derived, *Rennie* - 3044, 3060–2, 3067–8
considered Urgent by Lloyd's, *Rennie* 3050–2
Improvements since 1894, depth of water, &c., *Buchanan, Butcher* - 1645, 1646–52, 1672–5
Maintenance charge, *Shadwell* - - - 3037
Shallow spots, possibility of removing, *Young* 2962–6
Shipbuilding and engineering works, machinery and plant, and work that can be undertaken, *Rennie* - - - - - - 3044–8, 3071–80
Size of largest vessel that can be berthed and repaired - - - - - - - - p. 158
Tonnage that can be dealt with daily at present and in future - - - - - - p. 159
Total capital expenditure at 31st December 1913, *Hoy* - - - - - - - - p. 110
Trade with India, particulars *re*, *Buchanan, Butcher* 1654–60
Mail service, disadvantage of alteration of day of arrival in England, *Dunlop*, 1723–4; *Forsyth*, 1725–7.
RAILWAY:
Communication with Pretoria, comparison with communication from Delagoa Bay, *Abercrombie* 3175–86
to Johannesburg, length, gradients, &c., *Hoy* p. 108
Lower rates desired, *Abercrombie* - 3116, 3122
Wool export from, *see under* Wool.
Dutch East Indies, coal export to, and possibilities, *Williams*, p. 150, 2803; *Smyth*, p. 155.
Dutch India, tobacco competition, *Schenck* 4356–4361
East Coast of Africa, coal exports to, and possibilities, *Williams*, p. 148, p. 150, 2803 *Smyth*, p. 155.
East Coast fever, *see under* Diseases of Animals.

East London:
BUNKERING:
Classes of steamers for which bunkering done, *Lerchen* - - - - - - - - p. 121
Development hoped for when harbour improvements finished and large vessels come, *Lerchen* p. 121, 2661–5
Financial effect of providing inside accommodation to all shipping dealt with during 1913, *Sowarsby* 2745, *note*
Government assistance, *Lerchen* - - p. 121

East London—*continued.*
BUNKERING—*continued.*
Methods, *Lerchen* - - - p. 121, 2673–9
Quantities of coal, 1912, 1913, *Lerchen* - p. 121
Rates from Transvaal and Natal, *Lerchen* p. 121, 2664–8
of Ships unable to get in to river, question of, *Lerchen* - - - - - - - 2674–6
Success of, *Lerchen* - - - - p. 121, 2663
Cotton, *see that title.*
Fixed proportion of traffic, awkwardness and disadvantages of, and ports should be run on respective merits, *Abercrombie* 3092–111, 3126–9, 3131–42, 3148–68
FREIGHT RATES:
Charged by measurement or weight, whichever higher, railway rates based on weight, *Lerchen* 2694
Comparison with Cape Town and Durban, *Lerchen* 2680–94
Lighterage included, *Lerchen* - - - 2687
Taken into consideration in fixing railway rates, *Lerchen* - - - - - - - 2681–4
HARBOUR:
Assets, *Sowarsby* - - - - - - 2767
Breakwater scheme, details *re*, estimated cost, &c., *Sowarsby* - - 2699–711, 2725–9, 2735–66
Capital expenditure, *Sowarsby* - 2734, 2767–8
Capital expenditure, present charges and revenue, p. 158
Class of ships calling at, *Lerchen* - 2689, 2695
Coastal service, *Lerchen* - - - - 2696
Complaint *re* cement rates to Mossel Bay as compared with rates to, *Vintcent* - - - - 1201
Deepening to 40 feet and provision of accommodation for vessels of 1,000 feet, possibility, cost, &c. - - - - - - - p. 159
Dimensions, depth of water, and rise and fall of tide - - - - - - - - p. 157
Draught, *Sowarsby* - - - - 2700–1
Dredging, *Sowarsby*, 2715–20, 2723, 2736–3; *Grogan*, 2721–2.
Echelon arrangement of wharves not practicable p. 159
Expenditure and revenue, 1912, details - p. 160
Improvements, need for, and anticipated benefits, *Sowarsby*, 2699, 2725–9, 2742–4, 2752–64; *Grogan*, 2744, 2765–6.
Lighterage, cost, *Sowarsby* - - - 2742–4
Provision for ships drawing 35–40 feet, and 500–550 feet long, question of, and of possibility of turning, *Sowarsby*, 2708–11, 2712–4; *Grogan*, 2711.
Provision for vessels from 700–1,000 feet, question of possibility, *Sowarsby*, 2764; *Grogan*, 2765–6.
Revenue not equal to full interest and depreciation charges, *Sowarsby* - - - 2769–70
Size of largest vessel that can be berthed and repaired - - - - - - - - p. 158
Tariffs, revision, and uniform rates under consideration, *Sowarsby* - - - - 2770
Railway to Johannesburg, length, gradients, &c., *Hoy* - - - - - - - - p. 108
Railway rates on coal to, from all collieries in Orange Free State, Transvaal, and Natal, *Williams* p. 154
Wool export from, *see under* Wool.
Eggs, imports, value, 1907, 1912, *F. B. Smith* - p. 177

Egypt:
Coal export to, *Smyth* - - - - - - p. 155
Cotton, price of land compared with South Africa, *R. R. Smith* - - - - - - - - p. 285
Ostrich feathers, competition from, *O. Evans* 4398

Elder-Dempster line, rates from New York and St. John to South Africa by, and comparison with rates from London, *Jagger* - - - - 1248–9

Empire Development:
Board to assist in raising loans for development purposes on security of Dominions, practicability doubted by Johannesburg Chamber of Commerce p. 161
Co-ordination of technical and scientific departments in Dominions with institution such as Imperial Institute or department of Agriculture, question of, *F. B. Smith* - - - - - - 3823–4

Empire Development—*continued.*
Empire Body with advisory powers desirable, *Chappell* - - - - - - - - 3271–4; p. 161
Loans, joint Imperial guarantee, proposal not approved as regards South Africa, *Jagger* - p. 161, 3264–70
Engineering, white labour chiefly, and wages high, *M. S. Evans* - - - - - - - - - 805

Field cornets, expenditure on, by Department of Agriculture, 1913, *F. B. Smith* - - - p. 176
Fish, traffic carried on railways, 1912, 1913, *Hoy* p. 148
Fitzpatrick, Sir Percy, syndicate of, *see* Sundays River Settlement *under* Land and Land Settlement.

Flour and meal:
Import, 1906, 1909 - - - - - - p. 256
Value, 1907, 1912, *F. B. Smith* - - - p. 177
Foodstuffs, *see under* Agricultural Produce.
Forage, white flat rate, drawback to Natal farmers, *Jones* - - - - - - - - p. 266
Forage, hay, and lucerne, traffic carried on railways, 1912, 1913, *Hoy* - - - - - - - p. 148

Forests and Timber:
Afforestation, private enterprise, *Legat* - 6075
BLOEMFONTEIN DISTRICT:
Borer insect, known in certain parts of Cape Colony and Australia, *Johnston*, p. 293; particulars *re* destruction by, delay in taking up by Government and need for action, *Fichardt*, 6126–46, 6152–72, 6175–81; *Griffith*, 6197–203, 6214–30, 6247–52.
Botanical names of gums, *Griffith* - - p. 293
Eucalyptus plantations, Orange Free State, *Fichardt* - - - - - - 6189–91
Entomological names of borer beetles, *Griffith* p. 293
Plantations, *Griffith* - 6196, 6204–6, 6216, 6231
Planting:
of Foreign instead of indigenous trees, explanation, *Griffith* - - - - - 6233–8
Species, *Griffith* - - - - - 6238–44
Red gum, value of, and immunity from borer insect, *Griffith* - - - - - 6216–7
Compulsory tree planting advocated, *MacDonald* p. 268
Conservation measures, *Legat* - 6028–9, 6034–41
DEPARTMENT:
Functions and objects of, *F. B. Smith*, p. 176 p. 177; *Legat*, p. 287.
Government support, *Legat* - - - 6112
Staff, *Legat* - - - - - - p. 287, 6044
Destruction of, but steps being taken, *Legat* 6026–9
Devastation of, and effect on rainfall and conservation of moisture, *MacDonald* - - - p. 268
Gum plantations, *Legat* - - - 6057, 6110
INDIGENOUS:
Extent of, *Legat* - - - - p. 286, 6023–4
Locality, *Legat* - - - - - p. 286, 6025
Plantations not very successful, *Legat* - 6072
Regeneration and extensions, *Legat* - 6068–71

Forests and Timber—*continued.*
Labour, large number of persons employed, *Legat* p. 287, 6044–6
Management and control of, *Legat* - - p. 287
ORANGE FREE STATE:
Frost-proof trees, *Fichardt* - - - 6126
Plantations, *Griffith* - - - - - 6206–7
Planting, little being done except in Bloemfontein district and at Clocolan, *Griffith* - - 6245–6
Pinewood, *insignis*, suitable for fruit boxes, but quantity insignificant, *Legat* - - - 6073–4
Plantations, extent of, *Legat* - p. 286, 6023–4
Planting of pines and eucalyptus, *Legat* 6047–59, 6109–11
Teak, no true teak, *Legat* - - - - 6077–8
TIMBER:
Boxwood, use of, *Legat* - - - - p. 287
great Demand for, if it could be produced locally, *Legat* - - - - - - - 6030–1
Exports, 1912, *Legat* - - - - p. 286
Imports, quantity and value of various unmanufactured timbers imported, 1912, *Legat* - p. 286
Large market, *Legat* - - - - 6065–7
Output per annum, *Legat* - - - p. 287
Reduction of railway rates, 1912, *Hoy* 2439–41
Stinkwood, value of, and question of export, *Legat* p. 287, 6079–89
Traffic carried on railways, 1912, 1913, *Hoy* 2480, p. 148
Utility of various species, *Legat* - - p. 287
Value of, *Legat* - - - - - 6032–43
Yellow-wood, use of, for sleepers, and question of increasing supply, *Legat* - - 6095–6101
TRANSVAAL:
Areas, certain proportion retained by Government, and possibility of obtaining rights, *Haarhoff* 6445–8
Teak and mahogany, area of, *Haarhoff* - 6442–4
Business not taken up at present, although would be profitable, and question of season, *Haarhoff* - - - - - - 6442, 6449–52
Use for mining props, *Haarhoff* - - 6442–3
Tree planting necessary to check soil erosion and stop hot dry winds, *Macdonald* - - - p. 47
Wattle industry, *see that title.*
Fowler, Messrs. John, & Co., Leeds, reference - p. 270

France:
Brandy, so-called grape brandy not absolutely pure, *McDonald*, p. 302; *Beck*, 6536.
Export of whalebone and finners to, *Eyeland* p. 324
Import of seed potatoes from, *Liberman* 3449–51
Ostrich feather imports, *Edmeades* - - p. 190
Freights, *see under* Shipping.

Fruit and Fruit Growing:
Amount of land available for, *Pickstone* 6646–8, 6677–8
BLOEMFONTEIN DISTRICT:
Codling moth, destruction by, and need for Government regulations, question of municipality dealing with, *Fichardt*, 6126–51, 6167–4, 6173, 6182–8, 6192–4; *Griffith*, 6208–13.
Fruit not believed to be attacked by borer insect, *Griffith* - - - - - - - - 6220–1
Peach, attacked by borer insect, *Fichardt* - 6143
Box material, import from Sweden, *Pickstone* 6797–9
California, no Government inspector, but standardising of fruit by voluntary arrangement, *Pickstone* - 6697–700
CAPE PROVINCE:
Apple-growing, development, *Mackay* - 354
Capital required, *Pickstone* - 6668, 6729–32
Citrus, *see that title below.*
Cost of land and planting, *Pickstone* 6632–45, 6650
Developed orchards, prices attainable, *Pickstone* 6649–50, 6711–3
Expenses, *Pickstone* - - - 6589–93
Export:
Amounts, *Pickstone* - - - - 6602–3
Australian competition, *Pickstone* - - 6665
Cold storage, flavour of fruit not believed to be affected, *Pickstone* - - - - 6651–6
Cost per case of fruit from farm to market, *Pickstone* - - - - - - - 6686

Fruit and Fruit Growing—*continued.*
CAPE PROVINCE—*continued.*
Export—*continued.*
Grading, *Pickstone* - - - 6719–21
to Hamburg *viâ* London, question of competition of Hamburg with London, &c., *Pickstone* 6687–92
History of commencement of trade and development, *Pickstone* - - - - 6583
of Immature fruit, and need for compulsory inspection, *Pickstone* - - - 6653, 6656–9
Inspected fruit given preferential rate and preference in accommodation, *Pickstone* - 6657
little Loss suffered through fault of steamship company during last few years, *Pickstone*, 6702
Sale through agent, distribution in England, &c., *Pickstone* - 6598–602, 6706–8, 6714–6
Sale in London, not much importance attached to complaints, *Pickstone* - - - 6716–7
Ventilation on board, and self-registering thermometer desired, *Pickstone* 6654, 6679–81
Freight:
Arrangements *re* payment, *Pickstone* - 6594–7
Rates, and approval of, *Pickstone* - 6604–6
Introduction of special plums from California and Jaffa oranges from Palestine, *Pickstone* 6703–5
Labour:
Adult labour, except for experiment with boys in season, *Pickstone* - - - - 6743–7
Difficulty, *Pickstone* - - - - 6590
Employment of scholars from schools and colleges during holidays, *Pickstone* - 6590–2
Particulars *re* wages, &c., *Pickstone* 6587–9, 6629
White, tendency towards, *Pickstone* - 6673–6
more Land could be planted if more water, *Pickstone* - - - - - - - 6784–6
no good Land owned by Government, all taken up by private parties and public companies, *Pickstone* - - - - - - 6774–8, 6781–2
Price of trees, *Pickstone* - - - 6639–42
Prospects, *Pickstone* - - 6660–4, 6666–7
good Prospects if land irrigated, *Mackay* - 393–5
CITRUS:
Cape Colony:
Development, *Mackay* - - - - 354
for Export, Dr. McDonald's statistics considered optimistic, *Holland* - - - p. 25; 485
Land available for, question of, *Woodhead* 6846–9
Comparison with cotton, *Scherffius* - - 5997–8
Cultivation under Irrigation, *Kanthack* - 57–9
Export freight rates under mail contract, *F. B. Smith* - - - - - - - - p. 177
Government inspection charge - - - p. 322
Land, prices - - - - - - - p. 321
Lowest price at which industry would pay, *Woodhead* - - - - - - - - 6872–5
Oliphants River Valley:
Amounts exported and value, *Woodhead* 6810A–6817
Difficulty in getting land, *Woodhead* - 6843–5
Extension of industry, *Woodhead* - - 6841–2
Farmers going in for better varieties, *Woodhead* 6887–9
5,000 oranges from one tree seen, *Woodhead* 6870
Labour, *Woodhead* - - - - 6832–4
Mixed farms generally, *Woodhead* - 6831
Packing, particulars *re* costs, &c., *Woodhead* 6810A
Pests, and steps against, *Woodhead* - 6854–5
Prices in London, *Woodhead* - 6810A, 6882–6
Value of land, *Woodhead* - - - 6861–4
Possibility of obtaining land, *Woodhead* - 6864–9
Prices obtained, no complaint *re*, *Woodhead* 6858–60
Prices received, and return to farmers, *Woodhead* - - - - - - - 6820–30
Profitable nature of, and good prospects, *Woodhead* - - - - - - 6810A–1, 6869
Profits to be derived - - - - p. 321
Prospects and possibilities, *F. B. Smith*, 3780–1; *Woodhead*, 6877–81.

Fruit and Fruit Growing—*continued.*
CITRUS—*continued.*
Rustenburg district, Transvaal:
Boxes, wood imported - - - - p. 322
Co-operative society, *Bright* - - p. 321–2
Cost of land, *Bright* - - - - p. 322
Experimental shipments to London, *Bright* p. 322
Labour, wages, &c., *Bright* - - - p. 322
Particulars *re*, and possibilities of extension, *Bright* - - - - - - p. 321–2

Goats, number, 1904, 1911, *F. B. Smith* - - p. 177
Grain, *see* Wheat and Grain.
Great Fish river, Cape Midlands, large irrigation districts, capable of being broken up for smaller settlement, *Kanthack* - - - - - - 37–42

Griqualand West:
Artesian water, *see that title*.
Horse-breeding, *see that title*.
Ground nuts, Transvaal, would be profitable if labour sufficient and cheap and transport rates lowered p. 259

Guano Islands:
Expenditure on, by Department of Agriculture, *F. B. Smith* - - - - - - - p. 176, 3885
Particulars *re*, *F. B. Smith* - - - - 3882–5
Revenue from, considerable, *F. B. Smith* - p. 176
Gunnies, import from India to Durban, *Buchanan*, *Butcher* - - - - - - - - 1651–5
Harbours, *see* Ports and Harbours.
Hay, Transvaal, making of, possibility and value p. 257

Hides and Skins:
Branding, *van Breda* - - - 3486–90, 3500–1
Damage to fleeces by tar, *van Breda* 3487–90, 3499
Export:
from Cape Town, gradual increase, *van Breda* 3491
East London a greater centre than Cape Town, *van Breda* - - - - - - - 3484
Increase in, *van Breda* - - - - 3524–5
Value, 1907, 1912, *F. B. Smith* - - p. 177
Freight rates:
no Complaint *re*, *van Breda* - - - 3485
Homeward, and comparison with Buenos Ayres, *Wiener* - - - - - - - 1450
Price, increase, *van Breda* - - - - 3525–6
Traffic carried on railways, 1912–1913, *Hoy* - p. 148

Horses and Horse-breeding:
for Army purposes, profitable price, *Radloff* - 4649
Cape Province, numbers, 1865–1911, *Moffat* - p. 271
Dipping, value of, *Holland* - - 4465–6, 4476–7
Effect of soil on, *Radloff* - - - - 4652
Government should assist industry - - p. 255

GOVERNMENT STUD FARMS:
Policy, and abolition and question of effect, *Johnston* - - - - 4797–803, 4854–8
Question of advantages, &c., *Radloff*, 4645–6; *Johnston*, 4784–6.
Tweespruit and Standerton, abolition, *Johnston* 4797

GRIQUALAND WEST:
Possibilities, *Radloff* - - - - 4651–7
Suitability of, *Radloff* - - - - 4651
Heavier horses will be required - - - p. 255
Importation of, to South Africa for remount purposes and with a view ultimately to markets elsewhere, *Johnston* - - - - - - 4759
Increase in size, decrease in stamina as result, *Radloff* - - - - - - - - - 4640–3
Increase in size of mares desired, and question of methods, *Johnston* - - - - - 4846–50

NATAL:
no Export, Orange Free State more suited for horse-breeding, *Scott* - - - - 5295
Large import from England and Australia, and class of, *Scott* - - - - 5292, 5294
Number, 1904, 1911, *Moffat*, 5511; *F. B. Smith*, p. 177
Number imported free since October 1912, *F. B. Smith* - - - - - - - - p. 177

ORANGE FREE STATE:
no Definite policy, *Johnston* - - 4844–5, 4855
new Disease referred to, *Johnston* - - 4832–3
Numbers, 1880–1911, *Moffat* - - - p. 272
Type, stock, &c., *Johnston* - - - 4759
Ploughing with, instead of with oxen, question of, and difficulty owing to native labour, *Johnston* 4793–5, 4883–4
Production possibilities, *Radloff* - - - 4652–9
Slump, *Radloff* - - - - - - - 4613
Supply for Indian Army formerly, but trade now gone to Australia, and recovery of market desired, *Radloff*, 4621–80; *Johnston*, 4759, 4838–40.

TRANSVAAL:
Breeding:
Advice and instruction desirable p. 255, p. 258
Distribution of cast military mares - p. 255
Extension of, possibilities - - - p. 255
Establishment of horse-breeders' association, suggestion - - - - - - - p. 258

Horses and Horse-breeding *continued*.
TRANSVAAL—*continued*.
Horse sickness, success of measures against p. 258
Improvement, tendency towards - - p. 255
Outlook promising, and Government assistance in developing export trade advocated, *Palmer* p. 19
Type of horses, *Radloff* - 4619, 4624–48; p. 255
Use of, for army purposes, arrangement with Imperial Government desired, *Radloff* 4613–80
Use of motor-cars by farmers instead of, *Johnston* 1759, 1790–2

Horticulture:
Cultivation of native flowering plants, possibilities, *Pearson* - - - - - - - - p. 173
Expenditure on, by Department of Agriculture, 1913, *F. B. Smith* - - - - - - - - p. 176
Hull, fruit export to, through London preferred, *Pickstone* - - - - - - - - 6692–3

Immigration:
small Amount of, and comparison with emigration, *Jagger* - - - - - - - 178, 209
Assisted passages, *Jagger* - - - - 213–4
Attitude of Government and encouragement of land workers desired, *Jagger* - 178–80, 186, 210–2
OF BOYS:
Considered, but opposed owing to difficulty of placing white boys on farms, *Jagger* - 181
Introduction of scheme on lines of that in New Zealand might be possible, and prospects for, *M. S. Evans* - 839–40, 847, 853–4, 869, 886–9
Cheap transit by sea and land essential, *Madge*, p. 51
Class desired, *Robertson* - - - - 5704–5
Classes for which openings exist, *M. S. Evans*, 707–717
Development, possibilities of, but no prospect of South Africa becoming "a white man's country," *M. S. Evans* - - - - - - 805, 820–1
Encouragement desirable, want of population at bottom of all difficulties, *Williams* - - 2876–7
Encouragement not justified owing to difficulty of obtaining land, *Stephens* - - - - 3997
Excess of emigration over 1913, and class of, *Macdonald*, p. 48; *M. S. Evans*, 838.
of Farmers with capital from England and Scotland, need for, *Burtt-Davy* - - - - - p. 273
Farmers more used to coloured labour, *F. B. Smith* 249–50
no Field for introduction of white casual labour, but plenty of openings on the land, *Jagger* 178, 184–5
limited Field for white labour, *F. B. Smith* - 248–50
of Indians, cessation, *Butcher* - - - 1655–6
Manual workers, no openings for, as all manual labour done by natives, *M. S. Evans*; 805, 806, 890–3; *Jagger*, 178.

NATAL:
Boys, percentage do well and considerable percentage do not, *Scott* - - - - - 915
Class of man and qualities required, *Scott* 910–4, 918, 920–1
Men with capital should learn before spending capital on farming, *Scott* - - - 921
Prospects, *Scott* - - - - - - 910–2
no Opportunities for poor men in fruit growing at present, but possibilities by development of small holdings, *Pickstone* - - - 6669–72, 6676
Opposition to, dying away, and need for farmers from England and Scotland, *Burtt-Davy* - p. 273
Reduction of steamship and railway fares advocated to attract farmers, *Palmer* - - - - p. 49
Resumption of private lands by State, for settlement of young men with capital, scheme desirable, *M. S. Evans* - - - - - 841–2, 855–63
Room for immigrants if capable, with capital and some experience, *Kanthack* - - - - 42–50
of Scotch crofters and English peasants desired, and scheme, *Macdonald* - - - - - - p. 48
of Young people to work among natives and coloured people objected to, *Pickstone* - - - - 6744
Imperial Conference, permanent executive committee, proposal approved by Johannesburg Chamber of Commerce - - - - - - - - - p. 161

Imperial Institute:
Borer beetle, possible help of Institute in connexion with, *Fichardt*, 6134, 6194; *Griffith*, 6251–2.
Communication with Pretoria research department, *F. B. Smith* - - - - - - - 3762–5
Samples of cotton sent to, but no reports received, *Scherffius* - - - - - - - 5984–7
Tobacco exhibit being made up for, *W. B. Wilson* 5156–8

India and Ceylon and Eastern Ports:
Coal export to, particulars *re*, and possibility of increase, *Wiener*, 1440–2, 1474–6, 1524; *Butcher*, 1658–60; *Williams*, p. 148, p. 150, 2803–11; *Smyth*, p. 155; *Siedle* - - - - - - - 2914–6
Horses, export to, formerly, but loss of trade, *Radloff*, 4621–80; *Johnston*, 4759, 4838–40.
Trade with Durban, particulars *re*, *Buchanan*, *Butcher* - - - - - - - 1654–60
Ireland, import of seed potatoes from, *Liberman* 3355–7

Irrigation:
Area under, compared with total area of Union, *Macdonald* - - - - - - - p. 47
Beneficial results of, *Mackay* - - 352, 365–6
Boards, borrowing powers, *Kanthack* - - 5–6
Breede River scheme, *Edmeades* - - 4158–8A
Cape Province:
recent Act satisfactory at present, *O. Evans* 465–8
Bedford district, schemes, *Mackay* - - 353
Co-operative schemes, power of farmers to block, before Act of 1906, *Holland* - - - p. 25
Cost of land before, and cost of putting down works, question of, *Mackay* - - - 361–2
Cradock district:
Particulars *re* schemes, *Mackay* - - 352
Private enterprise, *Mackay* - - - 352
Difficulties *re* water rights in the past, but improved since Irrigation Act, *Mackay*, 358–9; *O. Evans*, 464–5.
by Earth banks across rivers, *Mackay* - 362–3
Humansdorp district, particulars *re* schemes, *Mackay* - - - - - - - 352
Inflation of price of irrigable land since development of ostrich farming, *Holland* - 489, 499
Initiative, *Mackay* - - - - - - 373–7
North-western, *Stephen* - 3972, 4019, 4048–50
Position, *Kanthack* - - - - - - 5
Private schemes by irrigation boards (farmers), and system, *Mackay* - - 356–60, 396–403
Progress retarded more by lack of appreciation of advantages than want of engineers, *Holland* p. 25
Small educative schemes, value of, *Holland* p. 25
by Smartt syndicate, *Mackay* - - - 406–8
Somerset East district, schemes, *Mackay* - 353
Sundays River:
Private enterprise, *Mackay* - - 354, 434–7
Schemes, *Mackay* - - - - - 353–4
Conservation of water, dependence of agricultural future of the country on, *Mackay* - - 367–72
Construction of railway by Government along Zak River and tributaries, *Kanthack* - - 64–7
Co-operative Schemes:
Advantages, *Kanthack* - - - - - 5
Confined to intermittent streams, *Holland* p. 25
Cultivation under, nature of crops, fruit, &c., *Kanthack* 54–64, 68–9
Department, functions, *F. B. Smith* - p. 176, p. 177
Development:
Anticipated, *F. B. Smith* - - - 228
Possibility of, *Mackay* - - - - 366
Dolomite water, position of, *Kanthack* - 167
Estimate of amount of land capable of, inadvisable, *Kanthack* - - - - - - - p. 53
Estimate of amount of land likely to be brought under, in next five years, *Kanthack* - - p. 54
Estimate of total amount of water flowing to sea, and proportion conservable by works, impossibility of giving, *Kanthack* - - - - - p. 52
Extension:
Benefit to be derived by wool industry, *Oxenham* 3573–8
in Connection with ostrich farming, *Vintcent* 3692–3
More farmers would be required *Mackay*, - 379–84

Irrigation—*continued.*
Extent of land available for small farming that can be dealt with by, *Kanthack* - - - 18–20
great Facilities for development of small irrigation areas, *Smartt* - - - - - - - - 227
by Farmers:
every Assistance should be given in construction of works - - - - - - - - p. 52
Particulars *re*, *Vintcent* - - - - 3692–3
Farmers will suffer less from drought and could still make farming pay, *Bourke* - 5454, 5479, 5486
Flood, system, *Kanthack* - - - - 51–71
Flow necessary to turn 3,000-morgen farm into stock farm, *Kanthack* - - - - - 125–6
Government surveys, *Kanthack* - - - 5, 6
Hartz River scheme, position of, *Kanthack* - 168
Hopetown scheme, particulars and success, *Wall* 581, 598–602, 611–32
Hydraulic Engineers:
Difficulty of getting, and training to local conditions, *Kanthack* - - - - - 127
Lack of, *Mackay* - - - - - - 377–8
Supply of, in Cape Province, and no hindrance to schemes by lack of, *Holland* - - - p. 25
Importance of Government pressing forward schemes, *Robinson* - - - - - - p. 46, 1046–52
Importance of, for small settlers, *Robinson* - 1052
Increase in value of land after, *Mackay* - 353
Kimberley District:
Bucklands estate scheme, particulars *re*, and failure of original settlers, *Carter*, 647–50, 651–7, 666–71
Douglas scheme, *Wall*, 593–6; *Carter* 641, 672–3
Government schemes advocated, but construction of railways or road motors essential for successful settlement, *Carter*, 641–6, 658–74, 681*a*–1*f*, 682–3
Government should undertake schemes, and prospect of large settlement on Orange River, *Wall* 603–10
Land available for, *Carter* - - - - 641
several Large schemes in hand and possibility of extension, *Wall* - - - - - 633–7
Large schemes involving co-operation desirable, *Wall* - - - - - - - - 584–5
Lucerne cultivation, *Carter* - - - 681*g*
Many farmers not sufficiently progressive, *Carter* 641, 650
Private schemes:
Particulars *re*, *Carter* - - - 676–81*b*
more Successful than Government up to the present, *Carter* - - - - - - 675
Progress, *Wall* - - - - - - 581
Railway along Riet River needed for bringing produce to market, *Carter* - - 641, 650
Riet River, possibility of utilising gravitation schemes and flood water, *Carter* - - 643
Schemes, *Carter* - - - - - - 641
Suitable available land in hands of private people, and probable price, *Carter* - - - 684–9
Land for:
will be Bought up as quickly as made irrigable, *Kanthack* - - - - - - - 91–4
Cost of, *Kanthack* - - - - - - - 5
Nature of land dealt with, *Kanthack* - 11–3
Practically all private, and people ready to bear expense, *Kanthack* - - - - - 161–2
Proportion that can be treated by, *Kanthack* 14
Total amount irrigated and capable of irrigation, question of, *Kanthack* - - 72–5, p. 53–4
Land being taken up as ready, but few people coming from outside, *Kanthack* - - 135–9
Newcastle district, Natal, plenty of water for, if stored, *Jones* - - - - - - - p. 266
Notes on Census figures for 1911 *re* amount of irrigated land, *Kanthack* - - - - - p. 53
Orange River, land suitable along banks of, area, *Holland* - - - - - - - 497–8
Orange Free State:
no real Attempts except at Koppies settlement for the poor whites and near Aliwal North, *Baumann* - - - - - - - - 735

Irrigation—*continued.*
ORANGE FREE STATE—*continued.*
Closer settlement will be developed by, *Baumann* 755
by Government and private co-operators, question of, *Baumann* - - - - - 779–81, 794
Large national scheme needed. *Macdonald* p. 48–9
Natural physical facilities for large scheme, *Baumann* - - - - - - - 746–9
Nature of produce that could be grown, *Baumann* 793
Power to make intervening owners join schemes desirable, *Baumann* - - 752–4, 774, 782
Railway communication, *Baumann* - 799–800
Rainfall and droughts and western portion becoming dry, *Baumann* - - 738–40, 745, 802
Storm water storage:
by Individual farmers, *Baumann* - - 741
Method proposed, *Baumann* - 785–91, 795–6
only Possible method, and Government scheme advocated, *Baumann* - - 737–61, 767
all Suitable land held by private people and right of compulsory purchase would be necessary, *Baumann* - - - 741–2, 751, 771–3, 775
Value of irrigated land, *Baumann* - - 792
in West, dependence of farming on gradually shrinking underground supplies, *Baumann* 761–2
OUDTSHOORN DISTRICT:
Litigation over water rights, large expenditure on, *Martin* - - - - - - - 4283
Riparian rights, *Edmeades* - 4206–9, 4169–70
Water rights, trouble with, sometimes, *Edmeades* 4168
People enthusiastic *re*, *Kanthack* - - - 144
Perennial and intermittent streams, *Holland* p. 25
Policy of Government to foster private enterprise and co-operative enterprise, *Kanthack* - 3
greater Possibilities in direction of small than large schemes, *Wall* - - - - - 582–4, 589
Pretoria district, water conservation, benefits to be derived, *Bourke* - - - - - 5486–91
Private enterprise, loans from Government, *Kanthack* - - - - - - - - - 6
Professional advice by Government, *Kanthack* 6
Prospects and profitableness compared with dry-farming, *Kanthack*, 90, 130; *Macdonald*, p. 48; *Palmer*, p. 49; *Robinson*, 1051–2.
Prospects for irrigated area hopeful, *Kanthack* 140
Railway construction, need for, in connection with, *Macdonald*, p. 49; *Baumann*, 800–1.
Robertson Canal, *Edmeades* - - - 4157–8
Small dams, enormous possibilities in building of, *Macdonald* - - - - - - - p. 48
Small settlement will be made possible, *Robinson* 1048–9
State schemes, failure, *Kanthack* - - - 5
Storage schemes, drawback, *Kanthack* - - 126
Stream gauging, position, *Kanthack* - - p. 52
Supply of water, *Kanthack* - - - - 153–60
if Two-thirds owners of land in favour of scheme, minority can be forced in, *Kanthack* - 141–2
more Valuable crops anticipated, *Kanthack* - 143
Van Wyk's Vlei scheme, reason of failure, *Baumann* 776
Works constructed by Government in some cases, *Kanthack* - - - - - - - 6
Japan, trade with, in ostrich feathers desired, and steps taken to encourage, *O. Evans* - - 4411–4

Johannesburg:
CHAMBER OF COMMERCE:
Extract from letter - - - - - - p. 81–2
Representatives, *see* Chappell, E.; Robinson, A. F.; *and* Soutter, H. W.
as Distributing centre, increasing importance of, *Chappell* - - - - - - - 3257–9
Drapery establishments, method of ordering stock, &c., and use of cables, *Austey* - - 1733–49
Railway communication with Delagoa Bay, *see under* Delagoa Bay.

Purchase by Government on behalf of applicant on condition of contribution of one-fifth of price:
Applications in different provinces, *Hughes* 265
Nationality of applicants, *Hughes* - - 265
Operations, statistics, *Hughes*, p. 12, 265; *Madye*, p. 51.
System, *Hughes* - - p. 11, 263–5
Rentals, calculation, *Hughes* - - - p. 12
Reservation of land for over-sea immigrants by, but no use made of, *Jagger* - 178, 187–8, 197
Reversion of land to large holdings after 10 years, possibility, *Hughes*, 313–4; *Byron*, 336–8
Sec. 16, statistics *re* operations, *Hughes* - 267

Land and Land Settlement—*continued.*
Act of 1912—*continued.*
Settlers with experience preferred, *Hughes* - 290
Terms, and comparison with Transvaal Consolidated Land and Exploration Co., Ltd., *Madge* - p. 51
Working of, *Jagger* - - - - - 182, 197
sufficient Attention not given to, *Byron* - 331
Bechuanaland, land held jointly by Government and Rhodesian railways, particulars *re* price, &c., *Hughes* - - - - - - - - - 271–2
Benefit to country as a whole, *Hughes* - 279, 288
Boring operations undertaken before allotment of farms in dry areas, *Kanthack*, 6, 27–9; *Hughes*, 276.

Cape Province:
See also Oudtshoorn district.
Acts of 1882, 1895, 1908, provisions, *Hughes*, p. 10
Average value and purchase price of land applied for under 1912 Act, and highest and lowest prices, *Hughes* - - - - - 317, 318
Breaking up of large farms:
Legislation would be valuable, *Brabant* - 531–2
Needed, and 500 acres should be limit, *Brabant* p. 26, 530
Bulk of land suitable for closer settlement in hands of private individuals, *Smartt* - 223
Capacity of land, *Brabant* - - - 4576–82
Crown lands:
Areas, *Hughes* - - - - - - p. 12
Available for settlement, extent and districts, *Hughes* - - - - - p. 13, 269–70
Farms, taking up of, by people retiring from business, *Brabant* - - - - 504, 518–22
Introduction of German, Scandinavian, and Scotch farmers, and success, *Brabant*, p. 26, 514
Large area of land that could be made valuable with irrigation, *Mackay* - - - - 423–8
Number of farms, 1913, *Hughes* - - 280–1
Outsiders, room for, with proper scheme of immigration, *Brabant* - - - - - - 510–2
Price of land, *Brabant* - - - 505–7, 523–8
Prospects, *Mackay* - - - 421 7, 450–4, 461
Size of farms, and breaking up of advocated, and tendency towards, *Brabant* - - p. 26, 501–7
Small farms, demand greater than supply at present, *Brabant* - - - - - - 508–9
Small holdings, proposed scheme, but financial difficulties, *Brabant* - - 514–7, 547–51

Closer Settlement:
Breaking up of large holdings for, possibility of, *Kanthack* - - - - - - - 37–42
Crown lands mostly of little value for immediate settlement, and establishment of large farms must precede, in remoter areas, *F. B. Smith* 230–2, 234–6, 251–4
Extent of land available for, in next ten years, question, *F. B. Smith* - - - - 238–41
Large areas at present in private hands available for, but practically all going into hands of people in the country, *Kanthack* - - - - 42–3
Newcastle district, Natal, suitable for, minimum size of holding advisable, capital, &c., *Jones* p. 266
Pig industry would be helped, *Baynes* - 5363
Possibilities of development, *Macdonald* - p. 47
Prospects on coast, Natal, *Baynes* - 5346, 5410
Subdivision of large farms, tendency, *F. B. Smith* 233
Suitability of, for officers on half-pay, *Brabant* 512, 529, 571–3
Crown Colony Government settlements, success of, *Byron* - - - - - - - - - 331

Crown Lands:
Area, *Macdonald* - - - - - - p. 47
Areas, in different provinces, *Hughes* - p. 12–13
Available for settlement, extent of, in districts, *Hughes* - - - - - - p. 13–4, 267
no Land suitable for incoming settlers, and substantial prices will have to be paid by, *Kanthack* 18–26
Considerable demand from residents for good agricultural land, *Hughes* - - - - - 267
Department, functions and operations, *Hughes*, 261–76; *F. B. Smith*, p. 176.

Land and Land Settlement—*continued.*
Desire of public for acquisition of land, and increase anticipated, *Hughes* - - - - - - 320–1

Development:
Considerable amount going on, *Smartt* - p. 8, 221
Conditions delaying, *Byron* - - - - 331
Hindered by development of gold and diamond fields, *Byron* - - - - - - 331
Possibilities of, but need for railways and comprehensive scheme, *Holland* - - - - 484
Suggestions, *Byron* - - - - - - 344–8
Education of public opinion and large and defined public policy needed, *Byron* - - - - 344
1820 settlement, success of, *Macdonald* p. 47, p. 48
Expenditure by Government, *Hughes* - - 275
Expropriation of land for purposes of, no powers of, *Byron* - - - - - - - - - 335
Failure of, and reasons, *Macdonald* - - p. 47
suitable for Farming, chiefly in hands of private individuals, not Crown, *Kanthack* - - 18–22
Freehold tenure, favoured by people, *Byron* - 334
great Future anticipated, *Byron* - - - 331
certain Good land not available, owing to malaria and private ownership, *Hughes* - - 322–5
Holdings in course of alienation under pre-Union Acts and Regulations, 31st March 1913, number, extent, and value, *Hughes* - - - p. 11
Immigrants, room for, if capable, with capital and some experience, *Kanthack* - - - 42–50
Importance of Government taking systematic steps, *Robinson* - - - - - - - p. 46, 1046
fuller Information should be obtainable, *Madge* p. 51
Itinerant instruction, value of, *F. B. Smith* - 243–4
Land available for, amount, *Smartt* - - 222

Land Companies:
Illiberal terms and conditions offered by, *Hughes* 282
Reply to Mr. Hughes's evidence, *Madge* pp. 51–2
Locking up of land, *Macdonald* - - - p. 47
Locking up of land, no machinery to prevent, and large companies should be prevented from holding up large tracts, *O. Evans* - - - 478–80
in Malarious districts, possibility of, *Byron* - 348

Mineral rights:
Grant of, question of extra payment, *Hughes* 309–10
Retention by Government and land companies:
Handicap, and rights should go with surface rights, *Huarhoff* - - 1010–1, 1041–2
in Perpetuity, *Byron* - - - - 339–41
Reason for, *Hughes* - - - - 306
Settlement checked by, and removal of restriction desired, *Smartt*, 219–20; *Hughes*, 294–6; *Byron*, 341–2.
estimated Value, *Hughes* - - - - 306–8
Movement between towns and land, *Scott* - 917

Natal:
Allotment of blocks by Government, system, *Woollatt* - - - - - - 972–4
Average price of general farm land, and question of comparison with other Dominions, *M. S. Evans* 843, 881–5
Average value in purchase price of land applied for under 1912 Act, and highest and lowest prices, *Hughes* - - - - - 317–8
Banks, reasonable facilities given to farmers, *Scott* 946
Closer settlement, difficulty, *Baynes* - - 1002
Compulsory taking of land by Government before union, and allotment to farmers, *M. S. Evans*, 864–5; *Woollatt*, 971–2.
Country suited for, if right sort of men obtained, *Scott* - - - - - - - - 910
Crown lands:
Areas, *Hughes* - - - - - - p. 13
Available for settlement, extent and districts, *Hughes* - - - - - p. 13–4, 271
no Large amount available, *M. S. Evans* 835
System and conditions of disposal, *Hughes* p. 10
Expropriation necessary, *M. S. Evans* - 836
Fair quantity would be available for general farming, *M. S. Evans* - - - - 844–6

Land and Land Settlement—*continued.*
NATAL—*continued.*
Few hundreds of men of right sort could be taken in every year, who would eventually superintend native labour, *Scott* - - 910–2, 949–52
at 5*l.* an acre, use of, *Scott* - - - 937–43
Holding of more land than can be worked in many cases, *Woollatt* - - - - - 981–5
Land bank, unreasonable facilities given with bad results, *Scott* - - - - - 946–7
Large quantities held by absentee owners for speculative purposes, and expropriation powers advocated, *M. S. Evans*, 855–61 ; *Marwick*, 953–9, 975–80 ; *Woollatt*, 967–70.
Number of farms, 1913, *Hughes* - - 280–1
few Outside settlers with capital taking up, *M. S. Evans* - - - - - - - - 867–9
Prices, *Scott*, 923–9 ; *Woollatt*, 985–8.
Prices too high to be profitable in some cases, *Scott* - - - - - - - 929–36
Transport, improved means of, needed in some districts, *Hughes* - - - - - p. 13
Value, increase, *Scott* - - - 922, 930
Native Land Act, provisions, *Woollatt*, 962–4, 989–1001 ; *Marwick*, 960–2, 965 ; *Scott*, 964–6.
ORANGE FREE STATE:
Average value and purchase price of land applied for under 1912 Act, and highest and lowest prices, *Hughes* - - - - - - 317
Crown lands :
Areas, *Hughes* - - - - - p. 13
Holding of, under leases, and none available at present for disposal, *Hughes* - p. 13, 269
Disposal of land, Acts *re*, and terms, *Hughes* p. 11
Holdings disposed of, 1913, number, *Hughes* 280
Increased value of land, *Hughes*, 277 ; *Baumann*, 803.
Number of farms, 1913, *Hughes* - - 280–1
Settlements, 1913, statistics, *Hughes* - 277
Settlements under Crown Colony Government, statistics, *Hughes* - - - - - 277
Settlers under Crown Colony Government still on the land, *Hughes* - - - - - 283
Settlers uniformly successful as a whole, *Hughes*, 278–80

Linseed, Transvaal, prospects if railway charges decreased - - - - - - - - - p. 257
Livestock :
See also Cattle *and particular names.*
for Breeding purposes, admission duty-free, *F. B. Smith* - - - - - - - - p. 177

Livestock—*continued.*
Coastal belt, use of, for stock other than ostriches possible since dipping carried on, *Holland* - 4465–6
Destruction under Stock Diseases Prevention Act, compensation, *F. B. Smith* - - - 3812–3
Development anticipated soon, *F. B. Smith* - 3795
Diseases, *see* Diseases of Animals.
Future of country lies in stock farming, *Kanthack* 3, 15–6
Importance of irrigation, *Kanthack* - - 3, 17
Improvement, *F. B. Smith* - - - - 3850
Numbers, 1904, 1911, *F. B. Smith* - p. 177, 3790
Number increasing but probably not equal to number before the War, *F. B. Smith* - - 3791–4
Pedigree stock, importation of, free of freight, provided for in mail contract, and statistics, *Wilson*, 1055 ; *F. B. Smith*, p. 177.
Prospects, *F. B. Smith* - - - - - 3753–4
Railway traffic, *Hoy* - - 2398–401, 2457–60
Transvaal, ill-treatment on railways, investigation advocated - - - - - - - p. 258
Local industries, hindering of, by railway rates, *Soutter*, *Robinson* - - - - 3189, 3214–5
Locusts, plagues of, in Natal, and elimination by arsenical spray, discovered by Anthony Wilkinson, *Baynes* - - - - - - - - - 5369

Lucerne :
Cultivation, *Kanthack* - - - - - - 54–6
Cultivation in Zak River district to be encouraged, *Stephen* - - - - - - - - 3980
Much land capable of growing by irrigation, *Liberman* - - - - - - - 3339–41
Natal, Newcastle district, cultivation possible but no facilities for irrigation, *Jones* - - - p. 266
Number of crops that can be grown in one year, *Vintcent* - - - - - - - - 3737
Oudtshoorn district, method of cultivation, number of crops, &c., *Edmeades*, 4083–6, 4123, 4161 ; *Martin*, 4280.
Price of land for cultivation, highest known in Cango district, *Martin* - - - - - - 4276–7
Production in Union and in Oudtshoorn district, 1911, *Edmeades* - - - - - - p. 189
more Profitable than wheat where irrigation necessary, *O. Evans* - - - - - - 4389–91
Transvaal, advance in, *Kleinenberg* - - 5722–3
Value of, and possibility of extending, by irrigation *Mackay* - - - - - - 352, 385–8
MacDonald, Dr., "Conquest of the Desert," referred to, *Holland* - - - - - - - - p. 25, 485

Machinery :
See also under Agriculture.
Import direct instead of at second-hand desirable, and through bill of lading advocated, *Wall* 1774–881
Importers, competition among, *Wall* - - 1783
Traffic carried on railways, 1912, 1913, *Hoy* p. 148
Madagascar, coal exports to, possibilities, *Williams* p. 150

Mail Services :
Carriage on Railways, fixed sum from Government from, *Hoy* - - - - - - - - 2402
Cost of service on basis of present subsidy as compared with cost at Postal Union transit rates and South African Statutory Private Ship rates, *J. Wilson* - - p. 84, 1119–25, 1148–51, 1154–5
Joint Service with Australia :
Advantages, *Smartt* - - - - 1331–4
would be Convenient from postal point of view but Post Office little concerned in, *J. Wilson* 1072, 1094
Calling at Durban, question of, *Williams* 2828–9
would be Considered, *Smartt* 1312, 1314–5, 1385–8
existing Service eight years to run and considered satisfactory by Johannesburg Chamber of Commerce - - - - - - - - p. 81, p. 82
Export of Natal coal to Cape Town for bunkering would be increased, *Williams* - - 2828
Question of, *Jagger* - - - - - 1241–2
Speed and subsidy question, *Jagger* - 1293–7
Rates, Postal Union, *J. Wilson* - - 1148–51

Mail Services—*continued.*
South African Mail Contract :
Alteration of day of arrival at Southampton to Tuesday instead of Saturday :
Consequent waste of time in South Africa, proposed remedy, *Jagger* - - 1243–5
Disadvantage to Durban, *Dunlop*, 1723–4 ; *Forsyth*, 1725–7.
Better terms secured than would be by contract for short periods with independent lines, *J. Wilson* 1070–1
Clause preventing differential rates to large shippers, *J. Wilson* - - - - 1077–9
Comparison with "statutory rate" system, *Jagger* 1238–40
Differential treatment of certain shipments, matter under reference to Arbitration Board, *J. Wilson*, 1060–2 ; *Jagger*, 1254.
Government freight contract and effect, *Wiener*, 1438–9, 1471–3, 1518–9 ; *Spilhaus*, 1533–4, 1536.
Government should be able to make good bargain, *Smartt* - - - - - - - 1381–4
Low rates from New York, &c., *viâ* England, would not affect, *J. Wilson* 1080–1, 1099–101
Post offices on steamers :
no Possibility of stewards benefiting by giving inaccurate information, *J. Wilson* 1145–7
Run jointly by Imperial and South African post offices, and no knowledge of attempt to create impression that only South African stamps should be used, *J. Wilson* 1082–8, 1138–40
Provision of new ships, *J. Wilson* - 1135–7
Rates, *J. Wilson* - - - 1063, 1067–9
considered fairly Reasonable, *J. Wilson* 1055, 1126–7
Regularity of service, *J. Wilson*, 1073 ; *Jagger*, 1240.
Regularity of service, good passenger accommodation and seamanship, *Smartt* - 1354–6
Speed :
failure to increase believed to be due to lack of competition, *Smartt* - 1347–53, 1389–95
should be Greater for present subsidy owing to developments in construction, &c., *Smartt* 1307, 1309–11, 1335–7, 1340–4
1888–1910, *Smartt* - - - - - 1307
Greater by boats before 1898 and when Union Co. and Castle Co. in competition, and examples, *J. Wilson*, 1131–2 ; *Jagger*, 1237 ; *Smartt*, 1307, 1310–11, 1351, 1404–8.
Increase :
Advocated, *Jagger*, 1237, 1246–7 ; *Smartt*, 1307 ; *Wiener*, 1503–5.
Tourist traffic will not be much influenced, *Hoy* - - - - - 2576–7
Particulars and provision for increase of, *J. Wilson*, 1055, 1102–4, 1128–32 ; *Jagger*, 1237 ; *Smartt*, 1307.
People believed to be fairly well satisfied, *J. Wilson* - - - - - - - 1105
Quicker service for same subsidy advocated, *Jagger* - - - - - 1289–97
Subsidy and provisions, *J. Wilson* 1055–9, 1112–8

Maize (Mealies) :
Bulk Handling :
Adoption advocated, *Burtt-Davy* - - p. 273
Considered, *Stephen* - - - - - 4071
Cape Province, production, 1865–1911, *Moffat* p. 271
Cattle farming can be usefully combined with p. 269
Climatic difficulties - - - - pp. 269–70
only Combination of sellers known of, Central Co-operative Agency, Transvaal, and working of, *F. B. Smith* - - - - - - - - 3806
Consumption in world, greater than of wheat, *Burtt-Davy* - - - - - - - p. 272
Cotton more paying than, on the average, *Scherffius* - - - - - - - - 5996
Cotton more successful in drought than, *Scherffius* 5977, 5982
Cotton as substitute for, or in rotation with, would be useful, *R. R. Smith* - - - - p. 284

Maize (Mealies)—*continued.*
DEVELOPMENT:
Anticipated, *F. B. Smith* - - - 3876–7
Capacity for - - - - - - p. 269
Hindered by absence of capital - - p. 270
Districts suitable for cultivation of, *Kanthack* 100–6
Experiments carried on *re* most suitable breeds of, definite types agreed on, and system of grading by Government officials instituted at ports - p. 270
EXPORTS:
1907, 1912, *F. B. Smith* - - - p. 177
1910, *Burtt-Davy* - - - - p. 272
1910–1913 - - - - - p. 269
Decrease, and reasons, *Spilhaus*, 1535, 1537; *F. B. Smith*, 3799, 3801–3.
Direct shipment to Liverpool, Manchester, Waterford, and Glasgow, advantages to be derived, *Burtt-Davy* - - - - - p. 273
Encouragement of dairying and pig-raising instead of, question of, *Bourke* - - - 5447–8
Favoured rather than keeping to feed cattle, *Van Zijl* - - - - - p. 271
not Large, *Wiener* - - - - 1492, 1494
Large trade not anticipated, *Scott* - 5262–3
Markets, and competition not feared - p. 270
Over-export, 1909, 1910, *F. B. Smith* 3804–5
Over-export and import at enhanced prices two or three years ago, explanation, *Pilkington* 5684, 5688
Price realised - - - - - p. 270
Prospects, *Woollatt* - - - - 5303
Rates, *Jagger*, 1275; *Wiener*, 1450; *Spilhaus*, 1544–9; *Butcher*, 1681–2; *Hoy*, 2432–6; *F. B. Smith*, p. 177.
Shipping contract, *J. Wilson* - 1074–5, 1107–11
Subsequent import in form of bacon &c., not approved, *Wiener* - - - - - 1493
Trade with Australia, commenced, *Burtt-Davy* p. 273
Favourable conditions in South Africa and comparison with North and South America, *Burtt-Davy* - - - - - p. 272, p. 273
Feeding of stock on, *F. B. Smith* - 3799, 3801–3
Local market, *Burtt-Davy* - - - p. 272
Machinery, demand, and increase, *Burtt-Davy* pp. 272–3
MECHANICAL PLOUGHING:
Advantages - - - - - - p. 270
Not wholly favoured, *Van Zijl* - - p. 271
Newcastle district, increase in production, *Jones* pp. 265–6
ORANGE FREE STATE:
Production, 1880–1911, *Moffat* - - - p. 272
Prospects, *Van Zijl* - - - - p. 271
rarely Pays under irrigation, *Kanthack* - - 60
Planting of cotton along with, possible but not recommended, but suits native farmer, *R. R. Smith* p. 285
Price, comparison with price of wheat, *Stephen*, 3968
PRODUCTION:
1904, 1911, *Moffat* - - - - - 5506
Annual, and comparison with U.S.A. and Argentine and differences due to climate - p. 269–70
Production, cost of, and profits, *Palmer* - p. 50
Prospects - p. 269; *Burtt-Davy*, p. 272, p. 273
Prospects good, but tendency to consume in country, *F. B. Smith* - - - - - 3784–5
Purposes for which maize can be profitably used p. 270
Quality better than South or North America and higher price obtained, *F. B. Smith* - 3874–5
RAILWAY RATES:
to Cape Town and for export, *Wiener* - 1493
Low:
Applies also to mealies for local use, *F. B. Smith* 3840–1
Benefits of, *F. B. Smith* - - 3800, 3809
Particulars, *Hoy*, 2433–5; *F. B. Smith* p. 177, 3783
Sensitiveness to drought and comparison with dairy industry, *Bourke* - - - - 5476–8
Springbok Flats districts, success of, *Haarhoff* 1017

Maize (Mealies)—*continued.*
STALKS:
Erection of machinery in Natal to extract vegetable wax from, not heard of, and doubt *re*, *F. B. Smith* 3878
Value as fodder, *Bourke* - - - - 5477
Stock food produced, value of, *Burtt-Davy* - p. 272
Trade with Dominions, &c., suggestion, *Burtt-Davy* p. 273
TRANSVAAL:
Conditions, comparison with America, *Pilkington* 5682
Consumption, *Pilkington* - - - 5684–5
Cultivation, improved methods desirable - p. 256
Export through speculators, *Pilkington* - 5688
Extension, railways might encourage - - p. 256
Fertilisers:
Importance of reduction of railway charges p. 258
Quality, Government guarantee desirable p. 258
Use of, on increasing scale, will be necessary p. 256
Improvement in quality, *Pilkington* - - 5682
Instruction of farmers by Government experts, need for increased attention to - - p. 258
Labour difficulty, *Pilkington* - - - 5688
Large growers, *Bourke* - - - - 5443
Necessity for strict measures to prevent careless and unscrupulous growers injuring industry p. 256
Production, decrease owing to drought, but prospects of increase of, with favourable seasons, *Bourke* - - - - - - 5441
Prospects, *Bourke*, 5442–3; *Madge*, p. 51; *Pilkington*, 5682; *Van Zijl*, p. 271; *Burtt-Davy*, p. 272.
Suitability of soil and climate, *Pilkington* p. 256, 5682–3
Use of, in country instead of exporting, advantages to be derived - - - - - - p. 256
Unlimited future in maize-growing for export or in conjunction with cattle-breeding or ranching p. 271
Use for cattle industry and not export in future anticipated, *Burtt-Davy* - - - - p. 273
Uses of - - - - - - - - p. 270
Uses of, in America - - - - - p. 270
Yield per acre, *Burtt-Davy* - - - - p. 272
average Yield per acre and comparison with other countries - - p. 256, p. 258; *Pilkington*, 5682

Malaria:
Possibility of eradicating, *Macdonald* - - p. 47
South African Anti-malarial Association, work of, *Madge* - - - - - - - - p. 52
Malarial mosquito, General Gorgas's work in eradication of, on Panama Canal, benefit to be derived from, *Baynes* - - - - - - - - 5372
Manufacturing, in embryo compared with other countries, *M. S. Evans* - - - - - 805
Manures, *see* Fertilisers and Manures *under* Agriculture.

Mauritius:
Coal export to, possibilities, *Williams* - p. 150, 2803
Export of fertilisers made from whale offal to, *Egeland* - - - - - - - - p. 323
SUGAR:
Competition of, *Campbell*, 3897–8; *Saunders*, 5033
Imports from, *Buchanan* - - - 1665–71
no Special freight rates, *Fowler* - - 5034–5

Meat:
Beef, export anticipated, *Woollatt* 5303, 5326, 5331–34
Consumption, large, *Moffat* - - - 5517–9
Export, possibilities, *Moffat* - - - - 5515
Import, *Johnston*, 4879–80; *Moffat*, 5516.
MUTTON:
Export, possibility of, *Doyle* - - - 5640
Orange Free State, export, question of desirability, *Johnston* 4759, 4771–3, 4796, 4834–7, 4875–80
Production increasing, and South Africa will be exporting before long, *Doyle* - - 5640

Meat—*continued.*
MUTTON—*continued.*
Transvaal, large import, and local production should be possible - - - - - p. 255
Trial shipments only, *Moffat* - - 5523–4
Provision made in mail contract *re* export freight rates, *F. B. Smith* - - - - - - p. 177

Medicinal, &c., Plants and Drugs:
Cultivation, areas most suitable for, *Pearson* p. 171

Nel's Rust Farm, Natal:
Bacon factory, *see under* Bacon industry.
Dairy, *see under* Dairying industry.
Newcastle district, *see under* Natal.

New Zealand:
BUTTER:
Comparison of quality with Natal, *Jones* - p. 267
Imports from, *Liberman* - - - - 3392–3
Wattle bark exports to, 1912, *Legat* - - p. 287
North America, maize cultivation, comparison of conditions in South Africa, &c., *Burtt-Davy*, p. 272, p. 273.
Oat-hay, export to Australia, refusal to accept Government certificate *re* freedom from disease, *Liberman* 3294–300, 3342

Oats:
Cost of production and profits, *Palmer* - - p. 50
TRANSVAAL:
Railway rates on, and fertilisers, need for decrease p. 258
Use of, and quality - - - - - p. 256
Varieties - - - - - - p. 256–7
Oil nuts or monkey nuts, Springbok Flats district, *Haarhoff* - - - - - - - - 1017
Oliphants River Valley, citrus growing, *see under* Citrus *under* Fruit growing.

Orange Free State:
Agricultural produce, comparative returns 1880–1911, *Moffat* - - - - - - - - p. 272
Agriculture, *see that title.*
Cattle industry, *see that title.*
Coal, *see that title.*
Co-operative societies, *F. B. Smith* p. 177, 3776, 3827–8
Dairying industry, *see that title.*
Desert, invasion of, into, *MacDonald* - - p. 268
Forests and Timber, *see that title.*
Gall lamziekte, *see under* Diseases of Animals.
Government stud farm and distribution of sires, *Radloff* - - - - - - 4645, 4665–70

Orange Free State—*continued.*
Horses and horse breeding, *see that title.*
Irrigation, *see that title.*
Land, *see that title.*
Livestock, comparative return, 1880–1911, *Moffat* p. 272
Locust invasions and steps taken *re*, *Johnston* 4826–31
Railways, *see that title.*
Sheep, *see that title.*
not Stocked to full capacity if farmers all grew winter feed and irrigation practised, *Gasson* 4709–16, 4730
Tobacco, *see that title.*
Wheat, *see that title.*
Wool industry, *see that title.*

Ores:
for Export, traffic carried on railways 1912, 1913, *Hoy* - - - - - - - - - p. 148
Transvaal, low railway rates desired for shipment, *Bourke* - - - - - - - - 5441

Ostriches and Ostrich Farming:
Age and life as regards feathers, *Liberman*, 3368–70, 3380–3; *Leroux* p. 189; *Edmeades*, p. 190, 4132–3.
Anthrax among, Grahamstown district, *Gray* 5580–2
Attention diverted from general all-round farming by, *Mackay* - - - - - - - 414–6
"Baakenskraal" farm, details, *Leroux* - - p. 189
Benefit to country, *O. Evans* - - - - 4422
Breeding, *Leroux* - - - - - - - p. 189
Capital required, question of amount, *Edmeades* 4259–61
Common birds allowed to die out, *Holland* - 4495
Cost of cleaning bush and establishing lucerne and subsequent value, *Holland* - - - 4466–8
Dead bird of no value with exception of feathers, *Liberman* - - - - - - - 3465–7
Depression in value of land will decrease, *Vintcent* 3713–7
Development of country owing to, *Vintcent* - 3686
Development of industry possible, *Liberman* 3429–30

Diseases and Insect Pests:
Government investigation desired, *Edmeades* 4229–39
Liability to, and nature of, *Edmeades* p. 190, 4129
Local efforts, *Edmeades* - - - - 4236
Necessity of research, *Edmeades* - 4131
Dry heat liked by, *Vintcent* - - - 3745

Eggs:
Export forbidden by Government except to German South-West Africa, *Liberman* - 3292–3
Export prohibited and justification for, *O. Evans* 4377, 4436–45
Expensive form of farming, *Holland* 4469, 4486–8

Export:
Prohibition of, and justification for, *Vintcent*, 3695; *O. Evans*, 4375–80, 4416–22, 4436–45, 4449–50, 4453–5; *Holland* 4471–5.
Prohibition, except to German South-West Africa Colonies, *Liberman* - - - 3292–3
Extension throughout Union, *Vintcent* - - 3694

Food:
Good feeding needed, *Liberman* - - 3285–9
Lucerne, experiments being made in Eastern Province *re* advantage of mowing over grazing, *Holland* - - - - - 1469, 4478–80
Nature of, *Liberman*, 3384–5, *Edmeades*, p. 191, 4124–7.
Fouling of land, and need for constant change, *Edmeades* - - - - - - p. 190, 4164–6
Future for irrigation in connection with, *Vintcent* 3692–3
General farming as well, possibility, *Holland* 4494
Health of birds in captivity, *Leroux*, p. 189; *Edmeades* p. 190.
Import formerly, but not a success, *Liberman* 3320–2
Improvement in other countries, question of possibility, *Edmeades* - - - 4222–8, 4240–1
In-breeding, *O. Evans* - - - 4402–3, 4446–8
Increase in value of land as result of, *Vintcent* 3686, 3688

Ostriches and Ostrich Farming—*continued*
Infantile mortality, *Edmeades*, p. 190, 4129–31; *Holland*, 4491–2.
Irrigable land cannot be so profitably used for any other purpose, *Holland* - - - 4485–4

Labour:
Little required, *Liberman* - - - 3366–7
Required, nature of, wages, &c., *Edmeades*, 4242–9; *Holland*, 4486–90.
Lucrative under favourable conditions, *Edmeades* p. 190
Mixed with other classes of agriculture in some cases, *Vintcent* - - - - - - - 3704

Natal:
Large extent but feathers not as high class as in Cape, *O. Evans* - - - - - - 4368
Soil, *O. Evans* - - - - - - - 4404
Nature of soil required, *Vintcent* - 3686, 3689–91
Number, *Holland* - - - - - - 4462–3
Number, 1904, 1911, *F. B. Smith* - - - p. 177
Number of ostriches to a morgen, *Vintcent* - 3706

Numbers:
Cape Province, 1875–1911, *Moffat* - - p. 271
Increase, *Liberman*, 3394–6; *Edmeades*, 4106–7.
Orange Free State, 1880–1911, *Moffat* - p. 272
in Union, Cape Colony, and in Oudtshoorn district, 1865, 1875, 1904, 1911, *Edmeades* - - p. 189

Oudtshoorn District:
Average number of birds kept by farmers, question of, *Edmeades* - - - - - - 4187–93
Industry now limited by all land available being irrigated, *Edmeades* - 4107–8, 4119–20, 4210
all Irrigable land not finished with, as tobacco could be replaced by, *Martin* - - 4281–2
Irrigation, *Edmeades* - - - - 4108–12
Large number of people have left land owing to concentration in a few hands, *Martin* 4289, 4294–300
Nature and price of land, *Vintcent*, 3689–92, 3704–6, 3716–7, 3721–6, *Leroux*, p. 189.
Nature of soil and climate and suitability of, *Leroux*, p. 189; *Edmeades*, p. 190, 4134–5.
Number per morgen, *Edmeades* - 4160, 4182–3
Number and increase, *Leroux* - - - p. 189
Price, *Edmeades* - - - - - 4261–4
large Storage reservoirs, need for inquiries, and question of construction by Government, *Edmeades* - - - 4107–22, 4157–8A
Tendency for industry to be concentrated in fewer hands, *Edmeades* - - - - - 4256–9
Tobacco as profitable at present, *Chambers* 4308–10
Tobacco will pay better in time, if feathers go down in price, *Martin* - - - - - 4287–8
Possible wherever lucerne grown, *O. Evans* 4366–7
Prices, *Liberman*, 3317–9; *Vintcent*, 3697–8; *Edmeades*, 4162–3; *Leroux*, p. 189.
Profitable, *Leroux*, p. 189; *Vintcent*, 3731.
very Profitable owing to increase of stock apart from feathers, *Holland* - - - - - 4461
most Profitable industry per acre, *Holland* 4482, 4485
Profits and capital required, *Liberman* 3330–8, 3358, 3365, 3397–8, 3453–61
Progeny, variation in value of chicks in same clutch, *Holland* - - - - - - - - 4472
a Prosperous industry, *Liberman* - - 3283–4
minimum Return at which industry profitable, *Edmeades*, 4103–5; *Martin*, 4278–80; *O. Evans*, 4423–5.
no Room for great extension of industry, and farmers should consider mixed farming, *Vintcent* 3702–4, 3718
Slump, beneficial effect on general farming will result, *Holland* - - - - - - - 4494
Small holders, not likely to succeed, *Edmeades* 4185
Tendency to areas being taken up by private individuals for, *Holland* - - - - 4482–3
Transvaal, success of, *Kleinenberg* - 5723–4
340-acre holding, success of, *Holland* - - 4488
other Uses to which land could be put, that would be equally paying, question of, *O. Evans*, 4387–90

Ostrich Feathers:
Advertising, question of, *Edmeades* - 4144–5
Advertising of, and opening up of markets, measures for, *Holland* - - - - - - - - 4461
Average return from birds during year, *O. Evans* 4384–6
Better than feathers of birds in other countries, and reasons, *Liberman*, 3293, 3323–5, 3417–28; *Vintcent* 3695–6.
Combination of feather dealers not known of, *Edmeades* - - - - - - 4173, 4181
Competition of other countries, question of, *Edmeades*, 4265–6; *Holland*, 4461–3, 4470.
Competition from other countries, possibility, &c., *O. Evans* - - - - - - - 4372, 4398–405
no Co-operative association, *Liberman* - 3401–3
Covers used to protect feathers from soil, *Holland* 4463, 4487
Demand not affected by Anti-Plumage Bill, *Holland* 4463–5
Demand for inferior feathers increasing, *Vintcent* 3734–6

Export:
to America, *Holland* - - - - - - 4463
Higher duty on dressed than on undressed feathers in America and Germany, *Vintcent* 3709, 3743–4
London the principal market, but not the only one, *Edmeades* - - - - p. 190, 4138
in Natural state, and no prospect of industry for dressing of, *Liberman*, 3387–8; *Vintcent*, 3708–9.
Port Elizabeth the chief port and then Mossel Bay, *Holland* - - - - - - - - 4469
Port Elizabeth a greater centre than Cape Town, *Liberman* - - - - - - 3279, 3386
Quantity and value, 1870–1912, *Edmeades* p. 189, 4095
Quantities and values to various countries, 1907–11, *Edmeades* - - - - - - p. 190
Shipments from September 1913 onwards, losses on, *Vintcent* - - - - - - - 3733
Special rate of freight, *Martin* - - 4291–2
Total, and through Mossel Bay, 1913, *Vintcent* 3684
Value, 1907, 1912, *F. B. Smith* - - - p. 177
Weight and value, 1865–1913, *Holland* 4460–1
Ideal feather, description, *Edmeades*, 4179; *Holland*, 4463.
Improvement owing to better feeding and breeding and selection of birds, *Liberman*, 3326–9, 3462–4; *Edmeades*, pp. 189–90.
Improvement of industry anticipated, *O. Evans* 4426–30
Inclusion in Anti-Plumage Bill, steps taken in view of possibility of, to point out fallacy of cruelty, *Edmeades* - - - - - - - 4269–70
Increase in export, in quantity and value, *Liberman* 3282–3
Increasing output likely to continue, *Edmeades* 4101–2
Industry on more stable basis than formerly, *Holland* 4461
not Likely ever to go entirely out of fashion, *Vintcent* 3736
Manufacture in South Africa only for local requirements, *Liberman* - - - - - 3387–90
six Markets a year, *Edmeades* - - - 4250
Northern Africa, exports, 1875, 1913, decrease, and competition not considered serious, *Holland* 4461

Oudtshoorn District:
Best in the world, owing to soil, selection and breeding, *Edmeades* - - 4134–7, 4220–1
Co-operative society for shipment of, contemplated, *Edmeades* - - - - - - 4148–9
Exports, weight and value, 1911, 1912, 1913, *Edmeades* - - - - - - - p. 190
Extension of markets, measures desirable, *Edmeades* - - - - - - - - - p. 190
Feathers stained by soil if rain excessive, *O. Evans* 4404
Shipments, ports of, *Edmeades* - - - p. 190

Ostrich Feathers—*continued.*
Plucking:
Cruelty:
Denial of, *Liberman*, 3287; *Edmeades*, p. 190, 4141, 4270–1; *Holland*, 4460.
Rumour of, not believed to have affected price, *O. Evans* - - - - - - 4408–9
Rumour, steps taken to remove, *O. Evans* 4408–9
Method, *Liberman*, 3287–90, 3375–80; *Edmeades*, 4142–3, 4271–4; *Martin*, 4283–4.
Pluckings, average prices of, *Holland* - - 4461
Prices:
1865–1913, *Holland* - - - - - 4460–1
Charged by retailers in England for manufactured feathers, farmers not affected, *Edmeades* 4267–8
Decreases recently and reasons, *Liberman*, 3330–2, 3358–63, 3399–406; 3411–4; *Vintcent*, 3684, 3687, 3699–701, 3706–7, 3710–1; *Leroux*, p. 189; *Edmeades*, p. 190, 4096–100, 4171–2, 4251–4; *O. Evans*, 4383, 4411, 4415, 4431–3; *Holland*, 4460, 4481.
Fancy prices for isolated show bunches, 1912, 1913, *Holland* - - - - - - - 4463
Farmers generally satisfied, *Edmeades* - 4181
not considered too High on the whole, *Edmeades* 4267
Increase:
Anticipated, *Edmeades*, 4171; *O. Evans*, 4383.
Since 1888, *O. Evans* - - 4371, 4381–2
London, average price, 1912, *Edmeades* - 4139
Low prices several years ago, *Vintcent*, 3712, 3729–30; *Edmeades*, 4098.
Present, question of, *Edmeades* - - 4253–5
Wearing of feathers by poorer classes not likely to increase owing to recent fall in price, *Holland* 4460
Private buyers at farms at Oudsthoorn, *Vintcent* 3739
Production:
Large increase anticipated, but no great effect on prices, *O. Evans* - - - 4370–1, 4406–7
Weight and value, 1870–1913, *O. Evans* - 4452
Purchase by working classes owing to increased wages not contemplated, *O. Evans* - - 4434–5
Quality
Dependence on climate, *O. Evans* - - 4368–9
Indifferent, *Holland* - - - - - - 4496
Quantities offered for sale at public auctions on London market, total prices, and average per lb., 1906–12, *Edmeades* - - - - - - p. 190
Sales:
at Port Elizabeth, *Vintcent* - - - 3738–42
Systems, *Edmeades* - - - - 4146–8
Soiled feathers, large percentage in case of severe weather, *Martin* - - - - - - 4282–3
Superior to Australian, *Oxenham* - - 3570–1
Trade with Japan and China desired, and steps taken to encourage, *O. Evans* - - - - - 4411–4
Traffic carried on railways, 1912, 1913, *Hoy* p. 148
Value dependent upon individual buyers, *Edmeades* 4174–8
Wearing of, by Cape coloured people, but market little affected by, *Vintcent* - - - 3747

Oudtshoorn District, Cape Colony:
Agriculture, *see that title.*
Bore-holes, a little water from, but not much, *Martin* - - - - - - - - - 4286
Chamber of Commerce:
Memorandum on behalf of - - pp. 189–191
Representatives, *see* Martin, A. E.
Concentration in towns, growing tendency, *Martin* 4289, 4294–300
Farmers and Fruit Growers' Association, representative, *see* Edmeades, E. D. L.
Fruit industry, *see that title.*
Irrigation, *see that title.*
Land and land settlement, *see that title.*
Lucerne, *see that title.*
Ostriches and ostrich farming, *see that title.*
Products, *Edmeades* - - - - - - p. 189
Prospects even if ostrich farming should fail, *Edmeades* - - - - - - - - 4152–3
Soil, nature of, *Edmeades* - - - - 4087–91

Oudtshoorn District, Cape Colony—*continued.*
Tobacco, *see that title.*
Value of fertile irrigated lands, *Edmeades* p. 190, 4151–2
Value of land, *Edmeades* - - - 4090–3

Oudtshoorn Town Council:
Memorandum on behalf of - - - pp. 189–91
Representatives, *see* Chambers, R. F., *and* Schenck, K.

Panama Exhibition, exhibit arranged for by ostrich farmers of South Africa, *Holland* - - 4461
Paraffin oil, reduction of railway rates, 1912, *Hoy* 2440–1
Pietermaritzburg Chamber of Commerce, representatives, *see* Dunlop, R., *and* Forsyth, D. F.

Pig Industry:
Bacon industry, *see that title.*
Closer settlement would help, *Baynes* - - 5363
Desirable in connection with dairy, *Baynes* - 5359
Encouragement of, instead of export of maize, question of, *Bourke* - - - - 5447–8
Number, 1904–1911, *Moffat*, 5511; *F. B. Smith* p. 177
Number imported free, since Oct. 1912, *F. B. Smith* p. 177
Prospects of industry, question of, *Bourke* 5444–6, 5447–8

Transvaal:
Advisability of developing industry and prospects p. 256, p. 258
Over-production easy owing to lack of bacon factories, *Pilkington* - - - - 5679
Profitable, *Pilkington* - - - - 5679
Reason for industry not being carried on more extensively, *Pilkington* 5679, 5700–2, 5689–90
Small farmers, suitability of industry for, *Pilkington*, 5679, 5689; *Robertson*, 5702.

Tuberculosis:
Cause, &c., *Gray* - - - - - 5541–7
Communication to human beings, risk very small, *Gray* - - - - - - 5569–70
Plants liable to convey dangerous diseases, regulations to exclude, *F. B. Smith* - - - - p. 178

Plant Disease Regulations:
Alterations, steps taken to give information of, *F. B. Smith* - - - - - - 3749*a*, 3859–60
Inspection in another country could not be substituted for inspection in South Africa, *F. B. Smith* p. 177–8
entire Uniformity of, in colonies not possible, but tendency towards more uniformity and strictness, *F. B. Smith*, 3749*a*, 3854, p. 178.

Population:
1904, 1911, *F. B. Smith* - - - - p. 177
Increase, need for, *Macdonald* - - p. 48, p. 49
Possible amount that Union can carry, *Macdonald* p. 48

Port Elizabeth:
Cement rates to, complaint *re* rates to Mossel Bay compared with, *Vintcent* - - - 1201–20
Coal brought to, by rail now, *Clift* - - 2646
Fixed proportion of traffic, awkwardness and disadvantages of, and ports should be run on respective merits, *Abercrombie* - - 3092–111, 3126–9, 3131–42, 3148–68

Harbour:
Advances by Government and rate of interest, *Clift*, 2623; *Walker*, 2623–4.
Breakwater, schemes and advantages to be derived, *Clift*, 2600–3, 2608, 2617–22, 2641–5, 2648, 2651–5; *Walker*, 2613–6, 2628–37, 2649–50.
Bunkering:
Cost of coal bunkered, compared with Durban and Cape Town, *Buchanan* - 1645, 1661–7
Question of possibility, *Walker*, *Clift* 2633, 2639–40, 2652–5
Capital expenditure, present charges and revenue p. 158
Control, *Clift*, 2623; *Walker*, 2623, 2627.
Deepening to 40 feet and provision of accommodation for vessels of 1,000 feet, possibility, cost, &c. - - - - - - - - p. 159
Dimensions, depth of water, and rise and fall of tide - - - - - - - - p. 157

Port Elizabeth—*continued.*
Harbour—*continued.*
Echelon arrangement of wharves not practicable under present conditions - - - p. 159
Expenditure and revenue, 1912, details - p. 160
no Extra charge by insurance companies for use of known, *Walker* - - - - - 2659
Freights to Durban complained of compared with rates to, *Buchanan*, *Butcher*, 1645, 1661–3, 1671, 1676–9.
Harbour dues, *Walker* - - - 2625–7
Lighterage and cost, *Clift*, 2596–9*a*, 2604, 2622; *Walker*, 2615–6, 2628.
Nature of roadstead and of water outside, *Clift*, 2588–95; *Walker*, 2615.
no Port dues, *Walker* - - - 2633–4
Repairs, few facilities for, of any magnitude p. 158
Rise and fall of tide, *Clift* - - - 2638
Size of largest vessel that can be berthed - p. 158
Tonnage of cargo landed, 1909–13, *Clift* 2612, *note*
Total capital expenditure, at 31st December 1913, *Hoy* - - - - - - - - p. 110
Traffic:
Increase, *Clift* - - - - - 2609–12
Railway material, temporarily, *Clift* - 2647
Zwaartkops river, tidal docks scheme, *Clift*, 2605–8; *Walker*, 2613.
Mohair export, *van Breda*, 3471; *Oxenham*, 3561.
Ostrich feather export through, and sales at, *Liberman*, 3279, 3386; *Vintcent*, 3738–42; *Holland*, 4469.
Railway rates on coal to, from all collieries in Orange Free State, Transvaal, and Natal, *Williams* p. 154
Railway to Johannesburg:
Length, gradients, &c., *Hoy* - - - p. 108
Rates compared with rates from Delagoa Bay *Chappell* - - - - - - - 3202
Soil of district, *Walker* - - - - 2649
Wool export from, *see under* Wool.
Port Natal, *see* Durban.
Port St. John's, cotton growing experiments, *Browne*, 5754–6, 5793–6, 5881; *R. R. Smith*, p. 284.

Ports and Harbours:
See also particular names.
Administration, *Hoy* - - - - - - p. 107
All, owned by Government with very few exceptions, *Hoy* - - - - - - - 107, 2261*a*
Annual loss on, *Ehrlich*, 2771; *Shadwell*, 3038.
Division of harbour working as between railways and harbours under consideration, *Hoy* p. 110, 2463–7

Dock Dues:
Differential, against companies in combination, Government's power *re*, *J. Wilson*, 1140; *Jagger*, 1253, 1280–4.
Dues, freeing of all ports from, suggestion, *Wiener* 1515

Fixed Proportion of Traffic:
Hindering of commerce and of development of competitive area by, *Abercrombie*, 3092–311, 3126–9, 3148–68, 3131–42; *Robinson*, 3189, 3194–9, 3208, 3226–30, 3253–6; *Chappell*, 3256.
Matter to be reviewed in five years' time, *Hoy* 2532–6
Graving dock accommodation, and inadequacy of, *Young* - - - - - - 2973–9, 3005–6
Jealousy between private shipping and landing interests, *Wiener* - - - - - - 2191
Names of principal harbours, *Hoy* - - p. 110
Proposed revision of rates, corresponding reduction of railway rates desired, *Robinson* - - 3207
should be Self-supporting and railway rates could be reduced, *Ehrlich* - - - - - 2771–2
State ownership an advantage, *Wiener* - 2191
Tariffs and charges, Commission *re*, referred to, *Wisely*, 3002; *Shadwell*, 3039.
Tariffs, revision under consideration, and uniform charges to be adopted, *Hoy* - - p. 110, 2462–3
Total capital expenditure at 31st December 1913, *Hoy* - - - - - - - - - p. 110
Wharfage, increase, *Shadwell* - - 3039–40
Working of, by Railway Department, objections, *Robinson* - - 3189, 3191–3, 3204–6

Portuguese East Africa:
Import of sugar from, into Transvaal duty free, *Campbell*, 3901–4; *Fowler*, p. 225, 5020–3.
Production of sugar, and question as to seriousness of competition, *Saunders* - - - 5003–10
Tobacco, competition, *Wides* - - p. 236, 5220
Post Office Act, 1911, government prevented from contracting with any company giving rebates and given powers to differentiate as regards goods brought by steamers of a combination, *Wilson*, 1140; *Jagger*, 1253, 1280–4.

Postal Service:
British postal rates to overseas papers reposted in London, concession valued, *Park* - - p. 87
Mail services, *see that title.*
Newspapers, universal Empire rate, suggestion, *Park* - - - - - - - - p. 87
Parcel post, extension of system so that goods could be forwarded and duty collected at place of arrival would be beneficial, *Wall* - - - 1872–7
Rates, half-ounce limit from South Africa for 1*d.*, reason for, *J. Wilson* - - - 1089–93, 1106

Potatoes:
Newcastle district, production, particulars *re* prices, &c., *Jones* - - - - - - - - p. 266
Production, little difference in 1911 from 1904, *Moffat* - - - - - - - - 5506
SEED:
Import:
Freedom from disease, nature of certificate required, *F. B. Smith* - - - 3855–65
Fumigation after import, and germinating power believed by farmers to be affected by, *Liberman* - - - 3308–16, 3349–57
High prices, *Liberman* - - - 3449–51
Reason, *Liberman* - - - 3444–6
Non-production for export, *Liberman* 3447–8
Potchefstroom Agricultural College, particulars *re*, *F. B. Smith* - - - - - - - 3767–71
Poultry industry, Transvaal, position and possibility of development - - - - - - p. 256, p. 258

Pretoria:
Chamber of Commerce, members of, *see* Abercrombie, H. R., *and* Bourke, E. F.
Development, prospects of, *Bourke* - 5469–71
Geographical position, *Bourke* - - - 5441
Laboratory for dealing with livestock diseases, *F. B. Smith*, 3752; *Gray*, p. 250–4.
Railway communication with Delagoa Bay, *see under* Delagoa Bay.
Research Department, communication with, and assistance from other countries, and inferiority of assistance from England, *F. B. Smith* - 3750–65
Wheat, *see that title.*
Publications, expenditure on, by Department of Agriculture, 1913, *F. B. Smith* - - - - p. 176

Railways:
Administration, *Hoy* - - - p. 107, 2261*a*–5
Agricultural lines, no steps taken to develop country after construction of, and losses on, *Robinson* 3238–42
All, owned by Government with very few exceptions, *Hoy* - - - - - - - p. 107, 2261*a*
Board, political influence on, independent board of experts desirable, *Abercrombie* - - - 3171
Capital cost of Government lines, *Hoy* p. 107, 2278–9
CAPITAL:
Creation of additional, out of profits, complaint *re*, *Robinson*, 3216–25; *Soutter*, 3225.
Interest paid on, *Hoy* 2271, 2280–3, 2507–10, 2585–7
Provision *re* contribution of, out of railway and harbour revenue, *Hoy* - - - 2266–7
Railways not charged with cost of raising, *Hoy* 2550–1
Carriage of mails, fixed sum from Government for, *Hoy* - - - - - - - - - 2402
Catering, bookstalls, &c., *Hoy* - - 2405–8
Coal for, *Hoy* - - - - - 2373–5, 2511–2
Constructed as routes to gold and diamond fields irrespective of quality of land, *Byron* - - 331

Railways—*continued.*
CONSTRUCTION:
by Contract in some cases, *Hoy* - - 2360–1
should have View to land settlement, *Byron* 345–6
Control, system, *Hoy* - - - p. 109, 2381–9
Control of goods direct from ship's side and doing away with forwarding agents not approved, *Robinson* - - - - - - - - 3191–3
Cost, *Hoy* - - - - - - - 2552–4
Depreciation, system, *Hoy* - - - 2488–94
Double lines, length, *Hoy* - - - - 2495
Electrification schemes, *Hoy* - - 2569–73
Financial results of working, 1909–1913, *Hoy* p. 146, 2468–70, 2503–5
Financial results of working, 1913, and before union, *Hoy* - - - - p. 109–10, 2362, 2391–416
GOODS TRAFFIC:
Receipts, *Hoy* - - - - - - - 2398
Statistics, 1909–13, *Hoy* - - - p. 147
Tonnage, carried 1913, 1912, classified according to certain specified commodities, *Hoy* p. 147–8, 2478–81
Government owned, proportion, *Hoy* - - 2275
Gradients, curves, and heights, *Hoy* p. 107–8, 2284–7, 2496
Length December 1913, length of double and single lines, &c., mileage in each province, *Hoy* p. 107, 2272–7
Lines authorised but not commenced, *Hoy* p. 108, 2302–9
Lines under construction, *Hoy* - p. 108, 2289–96
Livestock traffic, *Hoy* 2398–401, 2457–60, 2537–41
NATAL:
Coal traffic, conditions, &c., and improvements required, *Williams*, p. 151, 2853–6; *Smyth*, p. 155–6.
New works, *Williams* - - - - p. 151
Rolling stock, irregular supply for coal traffic, *Williams* - - - - - - - 2778–81
Net earnings, excluding earnings of a subsidiary character, *Hoy* - - - - - p. 147
Necessary in connection with irrigation, *Macdonald*, p. 49; *Baumann*, 800–1.
NEW LINES:
Cost, weight of rails, &c., *Hoy* - - 2304–9
for Development of agriculture and mining, *Hoy* 2291–3, 2300–1, 2578–80
Policy in construction, *Hoy* - p. 108, 2297–9, 2310–2
Working by telegraph and telephone, *Hoy* 2314–9
New works, particulars *re*, *Hoy* - - p. 108, 2288, 2565–8
North Western district, Cape Colony, projected line, and benefits to be derived in development of country, *Stephen* - - - - - 3972–94
Open mile results of working, 1909–13, *Hoy* p. 147

Fencing, improvement in carrying capacity of property by, *Gasson* - - - - 4707–8
Government stud farms, question of advantage, but no opposition by farmers to abolition, *Johnston* 4784–6
Growing of, for mutton, would be profitable in many parts, *Robertson* - - - - - 5634
Importation of Australian stud rams and sheep, good results, *Bock* - - - - - - - 4498
Improvement in quality and number since war, *Robertson* - - - - - - - 5631, 5638
Maintenance of quality, question of, and dependence on district, *F. B. Smith* - - - 3851–3
Mutton, *see under* Meat.
Natal, large import from Australia, *Scott* - 5292–3
NEWCASTLE DISTRICT, NATAL:
Pasturing, &c., in winter from Transvaal and Orange Free State, *Jones* - - - - p. 266–7
Suitability of district, *Jones* - - - p. 266
Number, *Bock* - - - - - - - 4535
NUMBER:
1904–1911, *Moffat*, 5510; *F. B. Smith*, p. 177.
Increase in, *Johnston* - - - - 4881–2
Number imported free since Oct. 1912, *F. B. Smith* p. 177
ORANGE FREE STATE:
Anxiety of farmers to improve stocks, *Johnston* 4782–3
Country overstocked with wrong type, *Johnston* 4781

Sheep—*continued.*
ORANGE FREE STATE—*continued.*
Difficulty in connection with industry, to eradicate scab entirely, *Johnston* - - - - - 4759
more Farmers engaging in trade, *Gasson* - 4740
Growing of winter fodder increasing and need for large amount, *Gasson* - - - 4739–43
Increase in numbers of sheep possible, especially if cattle decreased, *Gasson* - 4691–6, 4703
Numbers, 1880–1911, *Moffat* - - p 272
good Rams obtained from Australia, *Johnston* 4778–9
Sent to Natal during winter months, *Jones* p. 266
Sheep successfully introduced from New Zealand and Australia, *Palmer* - - - - - p. 49
Types, *Johnston* - - - - - - 4780
Promising outlook and successful competition with Australia anticipated, *Bock* - - 4498–509
Proportion of lambs reared, *Gasson* - - 4748
Scab, *see under* Diseases of Animals.
Stud, import from Australia, *van Breda* - 3530–2
Stud-breeding, will be increasing factor, *Bock* 4528–36
TRANSVAAL:
Best come from Australia, *Robertson* - 5633, 5639
Breeding of stud sheep not sufficiently carried on, but prospects, *Robertson* - - 5649–58
Breeds - - - - - - - - p. 255
Drawbacks - - - - - - - - p. 258
Fluke, negligible quantity only, but sheep should be prevented from going on fluky spots, *Robertson* - - - - - - - 5678
Increase since war - - - - - - p. 255
Instruction of farmers needed - - - p. 255
no Large extent, *Palmer* - - - - p. 49
Sent to Natal during winter months, *Jones* p. 266
Sufficient care not taken of flocks by farmers p. 255, p. 258
Suitability of country, *Robertson* - - 5633

Shipping:
British ships to Australia *viâ* South Africa, no cargo taken owing to Conference ring, but goods brought from Australia, *Jagger* - - 1299–305, 1477–8
Building of steamships by Governments, objections to proposal, *Campbell* - - - - - p. 75
CAPE ROUTE INSTEAD OF SUEZ CANAL OR PANAMA:
Advantages to be derived and possibility of, *Wiener* 1436–8, 1440, 1453–60, 1514–5, 1527
Larger vessels point to probability, *Hoy* - 1556
Chartering of tramp steamers, attempt, *Smartt* 1400, 1420
Combination, *Wiener* - - - - - - 1436–8
COMBINATION:
between Companies, and differential treatment against shippers not signing agreement, *Jagger* 1254, 1256–67
Causes of - - - - - - - p. 81–2
Believed to exist, *Smartt* - - - 1389–97
Possible methods of fighting, and question of State action, *Smartt* - 1371–4, 1398–403, 1415–9
Particulars *re*, and results, *Chappell*, p. 81; *Smartt*, 1344, 1375–80; *Wiener*, 1438, 1452, 1462–6, 1495–9, 1525–7; *Spilhaus*, 1529–31.
Question from point of view of South African public, *Smartt* - - - - - - 1313
Remedies, question of, *Wiener*, 1500–2, 1506–9, 1516–20; *Spilhaus*, 1532–4.
State action would be preferred, *Smartt* 1373–4, 1380
Uniformity of conditions and regular sailings, and stability of freight caused by - - p. 81, p. 82
Competition important, *Smartt* - - 1312, 1315
Extreme limits of size for long period believed to have been reached, *Rennie* - - - - 3044
FREIGHTS:
Comparison with Australia, *Jagger* - - 1298
Collection in England, *Wall* - - 1847–57
Comparison with other countries, *Spilhaus* 1535–6, 1544–9
from Continent same as from England, *Jagger* 1248
Differential, between ports, *J. Wilson* 1064–5

Shipping—*continued.*
FREIGHTS—*continued.*
Discrimination between Mossel Bay and Port Elizabeth, &c., *Vinteent* - - - 1201–20
to Durban, comparison with rates to Cape Town and Port Elizabeth and decrease advocated, *Buchanan*, *Butcher*, 1645, 1661–3, 1671, 1676–9.
Effect of new arrangement with Union Castle Co. on, *Butcher* - - - 1679 *and note.*

Spirits, traffic carried on railways, 1912, 1913, *Hoy* p. 148
Springbok Flats districts:
Prospects in, dependent on water, *Bourke* - 5443
Value of land and possibilities of development if irrigation scheme carried out, but refusal of Land Department to undertake, *Haarhoff* - 1011–24, 1030–40
Statistics:
see also under Agriculture.
no Compulsory records, *Reynolds-Tait* - 4985–6
Steel construction work, business chiefly on coast owing partly to high railway rates on raw material, *Robinson* - - - - - - - - 3215
Straits Settlements and Far East ports, coal export to, particulars *re*, and possibility of development, *Williams*, p. 148, p. 150, 2803, 2804, *note*, 2806; *Siedle*, 2915–6; *Smyth*, p. 155.
Sugar:
Class preferred by natives and Indian population, *Saunders* - - - - - - - 5051–3
Comparison with Javanese. *Saunders* - 5026–30
Competition of Mauritius sugar, *Campbell*, 3897–8; *Saunders*, 5033.
Condition of industry satisfactory, *Fowler* p. 225, 4988
Consumption, increase, but rate of, will decrease, *Fowler* - - - - - - - 5038–42
Cultivation, improvement in methods of, *Fowler* p. 224–5
Dumping of surplus sugar from Australia, *Campbell*, 3928
EXPORT:
1910, explanation, *Saunders* - - - 5054
Doubt as to profitableness. *Saunders* - - 501
Golden syrup imports, *Saunders* - - 5057, 5059
IMPORT:
Duty on, from abroad, *Fowler* - - - p. 225
Duty, except in case of Portuguese territories, and amount, *Campbell* - - - - 3929–30
from Mauritius, *Buchanan, Butcher* - 1665–71
from Portuguese East Africa, free of duty, into Transvaal. *Fowler*, p. 225; *Saunders*, 5020–3
LABOUR:
Cessation of indentured Indian labour, *Fowler* p. 225
no Difficulty anticipated, *Fowler* - - 4989
no Difficulty anticipated with Government assistance. *Saunders* - - - - 5047–8
Native, found satisfactory, and no difficulty anticipated. *Fowler* - - - - - p. 225
Wages, increase will be demanded. *Saunders* 5017–9
White, question of, but bulk of labour coloured, *Saunders* - - - - - - 4991–5002
MANUFACTURE:
Improvement in methods and extension of employment of chemists. *Fowler* - - p. 224–5
Mill work, results from new and modern machinery, *Fowler*, p. 224–5; *Saunders*, p. 225, 5024–5.

Sugar—*continued.*
NATAL:
Abandoning of tea cultivation in some cases for, *Reynolds-Tait* p. 222, 4927–8, 4956, 4962, 4978
Competition from Portuguese East Africa serious, in Transvaal, *Campbell* - - - 3901–4
no Excess, *Campbell* - - - - - - 3931
Exports:
1910, exceptional, *Campbell* - - 3911–4
to Great Britain:
not likely to be profitable, *Campbell* 3917–9, 3961–3
will be Possible without countervailing duty after 1914, *Campbell* - - 3915–6
Indian labour, *Campbell* - - - 3898–900
Irregular production, *Campbell* - - - 3914
Labour, difficulty, *Campbell* - - 3918–26
Market, South Africa, *Campbell* - - 3891
Preferential treatment on railways to Johannesburg, *Campbell* - - - - - - 3910
Prices, guided by London prices, *Campbell* 3956–60
Probability of supplying needs of the country, question of, *Campbell* - - - 3954–5
Production:
1913, *Campbell* - - - - 3887
Increase and prospects, *Campbell* - 3888–90, 3896
Proportion of total consumption of Union, *Campbell* - - - - - - 3894–5
Sufficient to overtake consumption, little prospect, *Saunders* - - - - - 5013–4
Prospects, *Fowler* - - - - - - p. 225
Reaping every two years, *Campbell* - - 3914
Refining and cane-crushing, *Campbell* 3932–55
Shipment to England, penalisation for receiving bonus on account of railway preferential rates to Johannesburg, *Campbell* - - 3891–3
Yield per acre, comparison with Java, Honolulu, and Cuba, *Campbell* - - 3927–8
Preferential railway rates, *Fowler*, p. 225, 5043–4; *Saunders*, 5031.
Price, control by price obtainable at coast ports, benefit from protection by preferential railway rates not very appreciable for short distances, *Saunders* - - - - - - - - 5031–2
PRODUCTION:
Distributed among considerable number of firms, *Saunders* - - - - - - - - 4990
and Increase, but supply not equal to demand, *Buchanan, Butcher* - - - - 1665–70
Profitable with control of local market, *Saunders* 5011–2, 5015–6
by Small growers, *Fowler*, 4990; *Saunders*, 4991.
Profitable nature of, may decrease in future, *Reynolds-Tait* - - - - - - - - 4978–84
Rates, lower from Mauritius to Port Elizabeth than to Durban, *Butcher* - - - - - - 1671
Small growers increasing in Zululand, *Campbell* 3940–1
Sucrose dependent on season, *Saunders* - 5045–6
Traffic carried on railways, 1912, 1913, *Hoy* - p. 148
Treacle, uses of, *Saunders* - - - - 5055–9
Zoutpansburg district, possibility of cultivation profitably, *Kleinenberg* - - - - 5724–5
Sundays Rises Settlement, *see under* Land and Land Settlement.

Tanneries:
Oils and greases believed to be imported, *van Breda* 3522–3
Situations, *van Breda* - - - - - - 3521
Supply, *van Breda* - - - - - - 3511–2
Tar, Transvaal, output, 1912, *Smyth* - - p. 155

Tea:
IMPORT:
1913, *Reynolds-Tait* - - - p. 222, 4924–5
Customs duty, 1885, 1904, *Reynolds-Tait* p. 222
NATAL:
Abandoning of, in some cases for wattle and sugar planting, *Reynolds-Tait* p. 222, 4927–8, 4956, 4962
Areas, *Reynolds-Tait* - - - - p. 222, 4940
Comparison with Indian, *Reynolds-Tait* - p. 222

EXPORT:
Countries of, *W. B. Wilson* - - - 5062
not Possible, owing to lower prices of Dutch, Indian, and American tobacco, *Schenck* 4356, 4361
very Small, *Chambers*, 4341; *Schenck*, 4354.
more Government instruction desired, *Schenck* 4361
Import, *Findlay* - - - - - - - 5712
Import, increase, *Scherffius* - - - - 5991
IMPORTS AND EXPORTS:
1911–1913, *W. B. Wilson* - - - p. 228
1912 - - - - - - - - - p. 191
from and to Rhodesia, 1911, 1912, *W. B. Wilson* p. 228, 5065–7
Improvement for export, possibility, *Schenck* 4357–9
Local production and comparison with consumption, *W. B. Wilson* - - - - - p. 228, 5061
MANUFACTURES:
Impossibility of Europeans carrying on, owing to lack of Government protection, and recommendations, *Wides* - - - - - p. 236
Room for improvement, *Findlay* - - 5712–6

Tobacco—*continued.*
NATAL:
Areas suitable for, at present growing mealies, *W. B. Wilson* - - - - - - 5140–5
Attention paid to, by Department of Agriculture, extent of, and dissemination of information by, &c., desired, *W. B. Wilson* - - 5080–3, 5090, 5147–9
Average production per acre, *W. B. Wilson* 5078–9
Cigar and cheroot manufacture, and impossibility of Europeans carrying on, and need for Government protection, &c., *Wides* - - - p. 236
Competition, *Wides*, p. 236, 5220; *W. B. Wilson* 5102.
Cultivation, neglect of, and need for improvement, *W. B. Wilson* - - - - - - p. 228
Europeans growing, number at present, and possibilities, &c., of increasing, *W. B. Wilson* 5092–109, 5105–23, 5139, 5242–3
Export:
1904–8, *W. B. Wilson* - - - - p. 228
Possibilities of, under preferential tariff, *Wides* p. 236, 5222
to Transvaal, value and amount, *W. B. Wilson* 5069
to United Kingdom, possibility of, with encouragement, and rebate on duty suggested, *W. B. Wilson* - - - - - - p. 228
Factories, number, *W. B. Wilson* - - 5085
Government protection and assistance needed, and suggestions *re*, *Wides* - - p. 236, 5224–57
Impossibility of white man competing with Indian growers on small scale, *Wides* - - p. 235–6
Improvement:
Encouragement by manufacturers, *W. B. Wilson* 5083–4
Prospects, *W. B. Wilson* 5127–30, 5139, 5146, 5149–51
Increasing interest in, *W. B. Wilson* - p. 228
Industry prejudiced by being in hands of Indian coolies, *W. B. Wilson*, p. 228, 5069–71, 5084, 5131–4; *Wides*, p. 235.
Manufacturers:
no Combination, *Wides* - - - 5259–60
Number of, *Wides* - - - - - 5258
Maturing, method and improvement needed, *Wides* 5249–52
Possibilities, *W. B. Wilson* - - - 5091
Preference would enable export of larger quantities to England, *W. B. Wilson* - - - 5145
Production, and no appreciable increase since 1905, *W. B. Wilson* - - - p. 228, 5069
Production of cigar type, *W. B. Wilson* - 5068
Production by Europeans, proposed encouragement, *W. B. Wilson* - - - - - 5072
Prospects of, owners of soil now being instructed in, *W. B. Wilson* - - - - 5112–23
Quality, *W. B. Wilson* - - 5100–1, 5137
Quality, better formerly, *Wides* - - - p. 236
State instruction advocated, *Wides* - 5237–40
Suitability of soil, climate, &c., and possibilities, *Wides*, p. 235; *W. B. Wilson*, 5068–9.
Uses of, *Wides* - - - - - - - p. 236
Nicotine for sheep dip, import from Austria and elsewhere - - - - - - - p. 191
Nicotine, determined by chlorine and nitrogen in soil, and possibility of counteracting by manures, *Schenck* - - - - - - - - 4362–4
Orange Free State, production, 1880–1911, *Moffat* p. 272
OUDTSHOORN DISTRICT:
present Annual output - - - - p. 191
little Assistance from Agricultural Department, *Chambers* - - - - - 4328, 4330
Cultivation:
will Increase if feathers come down, and price will fall unless export possible, *Chambers* 4315
Possibilities, *Edmeades* - - - 4152–3
a little Experiment tried with varieties of plants but not successful, *Chambers* - - - 4329
Expert instructor desirable, *Chambers* - 4331–2

Tobacco—*continued.*
OUDTSHOORN DISTRICT—*continued.*
little Export of, and no recognised public auction sales in United Kingdom, p. 190, *Chambers* 4301
Factory for smoking-tobacco, *Chambers* 4318–9
Growing of, on tenant system, on half-shares, *Chambers* - - - - - - - 4308
Increasing, but consumed locally, *Chambers* 4305–6
Land specially suitable, and plenty of land available, *Chambers* - - - - - - 4326–7
Manufactories of nicotine for sheep dip, &c., to be established - - - - - - - p. 191
Nicotine for dipping purposes, factory not yet started, but possibilities, *Chambers* - 4319–23
Price of land, *Chambers* - - - - - 4316
Production per acre, question of, *Chambers* 4336–7
Profitable, and as good as feathers at present, *Chambers* - - - - - - 4308–10
Proportion of nicotine and value for sheep dip or insecticide - p. 191, *Chambers*, 4333–5, 4344–7
Putting of, on English market to be attempted, *Chambers* - - - - - - - 4307
Return per acre, *Chambers* - - 4311–14
Stocks, 1891, 1904, 1911 - - - p. 190–1
will Pay better than ostrich farming in time if feathers go down in price, *Martin* - 4287–8
Possibility of manufacturing sheep dip, question of, *Schenck* - - - - - - 4350–3, 4361
Profitableness of cotton growing compared with cost of labour, &c., *Scherffius* - - 5946–9, 5988
Prospects, *F. B. Smith* - - - - - 3780–2
RHODESIA:
Competition of Natal with, possibility of, *W. B. Wilson* - - - - - - - 5102
Control of industry, *Wides* - - - 5233
Government assistance, *W. B. Wilson* - 5148
Manufacture, *W. B. Wilson* - - - 5104
Position of industry, *Wides* - - - p. 236
RUSTENBURG DISTRICT:

Traffic, 1912, 1913, *Hoy* - - - p. 148
Stripping, process, *W. N. Angus* - - 6427–8
Use for tanning, *Fraser* - - - - 6258–9
Competition chiefly with South America, *Campbell* 6118, 6123–4
Cost of ploughing, sowing, and labour, *F. T. Angus* 6375–8, 6393
Cultivation:
Climatic conditions of Natal very favourable, *F. T. Angus* - - - - - - - 6384
Crop fairly certain, *Campbell* - - - 6122
Improvement of soil from, *F. T. Angus* - 6327
Labour:
Difficulty, and output limited by, *F. T. Angus*, 6318, 6320–1, 6402–6
Native, wages, *W. N. Angus* - 6419–22, 6425A
Localities, *Legat* - - - - - 6060
Method, *Campbell*, 6121; *F. T. Angus* 6379–81
in Natal chiefly, some in Transvaal, but Free State too cold, *F. T. Angus* - - - - 6318
in Natal by private enterprise, *Legat* - p. 287
Number of trees per acre, *F. T. Angus* - 6392
Price at which profitable, *Campbell* - - 6120
Profitable at present for plantations near railway, *F. T. Angus* - - - - - - - 6342–4
Profitableness, comparison with other products, *F. T. Angus* - - - - - - - 6364–7
Distillation of Wood:
All trees of same age of equal value. *Fraser* 6312–5
Attempts to get support from War Office, but vested interests, *Fraser*, 6261–5, 6274–8, 6283, 6285, 6288, 6304, p. 294; *W. N. Angus*, 6416–7.
Bye-products, question of markets for, *Fraser*, p. 295
Carbonising plants at seven centres and central refinery suggested, *Fraser* - p. 294, p. 295
Establishment of industry in Natal, possibility of, if British War Office agreed to use acetone from Natal wood instead of from Bosnian beech, *Fraser* - - - - - - 6255–315; p. 294
Experiment with extract in England, *Fraser*, p. 295; 6266–73, 6280, 6292–4, 6307–8
Factories, estimated receipts and expenses, *Fraser*, p. 294
Laying down of plant for, would be great advantage to industry, *W. N. Angus* - - 6414–5
Possibilities not known to have been put before Brunner, Mond, and Co., or other company. *Fraser* - - - - - - - - 6285–7
Purchase of trees by central factory, instead of establishment of several private factories, question of, *Fraser* - - - - - 6309–15
Use of acetone in celluloid industry, &c., *Fraser* 6300–2
Waste of large quantities of wood at present, *W. N. Angus* - - - - - - 6418
Extract, export of, and not bark, should be considered. *Legat* - - - - p. 287, 6090–4
Extraction, Natal growers considering. *Legat* 6091
Development unlimited, if home market can be got, *Campbell* - - - - - - - 6114, 6119
Natal:
Abandoning of tea cultivation for, in some cases, *Reynolds-Tait* - p. 222, 4927–8, 4956, 4978
Land, price, and use of. *Scott*, 924–7; *Woollatt*, 988.
Pests. *F. T. Angus* - - 6318, 6328–31, 6382–3
Plantations, extent, *Legat* - - - - p. 287
Planting:
Check. *F. T. Angus* - - - - - 6374
by Maritzburg municipality. *F. T. Angus*, 6386–90
Products obtainable from, *Fraser* - - p. 295
Realisable value of, *Fraser* - - - - p. 295
Speedy reproduction. *Fraser* - - - p. 294
Tree brought from Australia, and grows better, *Fraser* - - - - - - - - 6295–7
Uses of. *Legat*, 6061–2; *Campbell*, 6115.
Wattle Growers' Association. *Legat* - - 6102–4
West Coast of Africa, coal export to, *Williams* p. 148

Whaling Industry:
no Ambergris, *Egeland* - - - - - 7055
Boats duty free, and equipment allowed in duty free with boat at first, *Eyeland, Bearpark* - 6982–6
Boilers, local construction, *Egeland* - - p. 323
Calving, question of periods, *Egeland*, 7034–5; *Bearpark*, 7036.
Capital invested in industry in Natal, *Bearpark* p. 324
CATCHES:
1911, 1913, *Egeland* - - - - - - p. 323
Species, *Bearpark* - - - - - - p. 324
Charges excessive, and reduction of, the only remedy now, *Egeland*, p. 323, 7091–2; *Bearpark*, p. 324, 7089–90.
Commencement with advent of steamers, *Egeland*, 6962–4; *Bearpark*, 6964.
COMPANIES:
present Capital expenditure, *Egeland* - p. 322
Dividends, *Egeland* - - - p. 323, 6941–2
Excessive numbers of, and no more licences should be granted, *Egeland*, p. 323, 6952–3, 6997–8, 7058–9; *Bearpark*, 7083
Reduction, compensation would be necessary, *Egeland* - - - - - - - - 6996
not specially Dangerous, *Bearpark*, 6960–1; *Egeland*, 6961.
Decrease in number of whales and reduction of licences desirable, if possible, *Egeland*, 7059–66; *Bearpark*, 7066.
Expensiveness of industry, and increase, *Egeland*, p. 323, 6954; *Bearpark*, 6958.
Extermination of whales, impossibility, *Egeland* p. 323
Factories, particulars *re*, *Egeland*, 7037–9; *Bearpark*, 7039.
Floating factory, *Egeland* - - - - - 7086
Gear and gunpowder obtained from Norway, *Egeland* - - - - - - - - p. 323, 6979
Gear, high customs duty, and gear should be duty free, *Egeland*, p. 323, 6955–7, 6980–1; *Bearpark*, p. 324.
Growth of, 1908–1913, *Bearpark* - - - p. 324
History, *Egeland* - - - - pp. 322–3, 6964
Inaugurated by Norwegian Co., but majority of companies now carried on on British capital, *Bearpark* - - - - - - - - p. 324
Investigation, suggestions, *Bearpark* - - p. 324
LICENCES:
Issue of, power to Union Government only, would be preferable, *Egeland* - - - - - 7093–7
Rates and details and highness of, *Bearpark*, p. 324, 7086–7; *Egeland*, p. 323, 6987–91.
Migratory habits of whales, *Bearpark*, 6948, 7004–5; *Egeland*, 6948–51, 6998–7007.
Norwegian company, conditions *re* customs, &c., the same, and no difficulty *re* competition, *Egeland*, 7098–106.
Number of whales caught, dividends paid since 1908, *Egeland*, 6965–8, 6971–7; *Bearpark*, 6968–70.
Number of whales landed at Durban altogether, *Egeland* - - - - - - - - - p. 323
OIL, WHALEBONE, &c.:
Complaint *re* freight, price and market, &c., *Egeland*, p. 323, 7017; *Bearpark*, 7013–6.
Local consumption and increase hoped for, *Egeland* - - - - - p. 323, 7028–31
Local market and buying by Lever Bros. for soap, *Egeland* - - - - - - 7019–23
no Market in South Africa, *Egeland* - p. 324
Markets, *Egeland* - - - - - p. 323
Prices, *Egeland*, 7009–11, 7048–52; *Bearpark*, 7052–4.
Railway rates, *Egeland* - - - - - 7081
Use of, for margarine and question of, *Egeland* 7023–4
Value of, *Egeland*, 7008–11; *Bearpark*, 7011–2.
Whaling station run by large firms of soapmakers, particulars *re* manufacture, &c., *Bearpark*, 7024–8
Products, amount, 1913, and value, *Egeland*, p. 323; *Bearpark*, p. 324.
Revenue derived by Government from leases of land, &c., *Egeland* - - - - - - p. 323
Seasons, *Egeland* - - - - - - p. 323

Whaling Industry—*continued.*
Species of whales, *Egeland* - - - - - p. 323
Tariffs, consideration desired, *Egeland* - 7084
Whalers, number, cost, and place of construction, *Egeland* - - - - - - - p. 323, 6979
Protection of cows, suggestion, *Eyeland*, 7032–6; *Bearpark*, p. 324, 7033, 7036.
PROTECTION OF WHALES BY INTERNATIONAL AGREEMENT:
Advocated, *Bearpark* - - p. 324, 6946–8
Unnecessary, and would be impracticable, *Egeland*, p. 323, 6943–5
REGULATIONS:
on Basis of Newfoundland regulations and Japanese ordinances advocated, *Egeland*, p. 323, 6992–5
Suggestions, *Bearpark* - - - - - p. 324
RAILWAY TRANSPORT OF CARCASES:
Rates excessive, *Egeland*, p. 323, 7067–8, 7077–80; *Bearpark*, p. 324, 7047.
System, *Egeland*, 7041–5, 7069–79; *Bearpark*, 7046
South African Whaling Co. the only Norwegian Co., *Egeland* - - - - - - 7098–100
Statistics, importance of, *Bearpark* - 7033, 7040
Wages, higher than in other parts of the world, *Bearpark* - - - - - - - - 6958–9

Wheat and Grain:
Annual consumption, and increase owing to natives taking to, *Stephen* - - 3966–7, 4038, 4053–6
Area under, *Moffat* - - - - - - 5525–6
Bags:
Admission duty free, *F. B. Smith* - - p. 177
Increase in cost, *Burtt-Davy* - - - p. 273
CAPE PROVINCE:
North-Western District:
Area, and possibilities, and importance of scheme in, if supply to equal demand, *Stephen* - - - - - - 4002–6
Average return per acre, *Stephen* 4027–9, 4046
Average weight of wheat to bushel, *Stephen* 4024–6, 4058–9
Cost of land and of irrigation works, *Stephen* 3978–9, 4047–9
Labour difficulty, and use of machinery necessary, *Stephen* - - - - 3976–7
Prospects and particulars *re* Zak river scheme, *Stephen* - - - - - - 3969–4059
Production, 1865–1911, *Moffat* - - p. 271
Prospects owing to railway extension, *Moffat* 5537
Consumers, *Stephen* - - - - - - 4051–2
Cost of production and profits, *Palmer* - p. 50
Competition with Australia, impossibility, *Holland* 4484
Consumption of maize greater than that of, *Burtt-Davy* - - - - - - - - - p. 272
Cultivation will increase with railway extension, *Stephen* - - - - - - - - 4009–11
Cultivation under irrigation, *Kanthack* - 61–3
Duty on, *Stephen* - - - - - - 4047
Export not anticipated, or very small quantities *Stephen* - - - - - - - 3965, 4022–3
Fertilisers, prices increasing, *Eyeland* - - 7056
Grain inspection, expenditure on, by Department of Agriculture, 1913, *F. B. Smith* - - p. 176
IMPORT:
1907, 1912, *F. B. Smith* - - - - p. 177
1913, *Stephen* - - - - - - - 4001
from Australia:
Bags:
of Inferior quality and loss owing to breaking, *Stephen* - - - - 4073
Size, and not merchantable in South Africa, standardisation of size desired, *Liberman* 3301–5, 3343–6, 3434–42
Freight rate, *Stephen* - - - - 4074–7
by Liners and tramps, and tramps preferred, *Stephen* - - - - - - 4073, 4078
Shortages in, and question of remedy, bulk handling would be advantageous, *Stephen* 4061–73
Large area suitable for, if rainfall sufficient, *Stephen* 4041

Wheat and Grain—*continued.*
Lower export railway rates, *Hoy* - - 2437
Lucerne or food for stock more profitable, where irrigation necessary, *O. Evans* - - 4389–90
Orange Free State, production, 1880–1911, *Moffat* p. 272
Price, comparison with price of mealies, *Stephen* 3968, 4037
Prices, *Stephen* - - - - - - - 4043–4
Production:
1904, 1911, *Moffat* - - - - - 5502–5
1911, 1912, 1913, *Stephen* - - 3965, 4000
may Equal consumption in six or seven years with steady expansion of railways, *Stephen* 3965, 3998, 4022
Increase:
Anticipated, *Stephen* - - - - 4007
Importance of, *Stephen* - - - 3965
low Railway rate, *Stephen* - - - - 4032–5
Returns necessary in order to make cultivation pay, *Stephen* - - - - - - - - 4042
Springbok flats, prospects with conservation of water, *Bourke* - - - - - - 5486–91
Traffic carried on railways, 1912, 1913, *Hoy* p. 148, 2480
Transvaal:
see also Springbok Flats *above.*
Average yield per acre - - p. 256, p. 257
Extension, possibility - p. 256, p. 257, p. 258
Irrigation necessary - - - - p. 256
Little grown and imports of flour and meal increasing - - - - - - p. 256
Seldom milled - - - - - - p. 257
Prospects with conservation of water, *Bourke* 5486–91
Quality - - - - - p. 256, p. 258
Railway rates on, and fertilisers, need for decrease, p. 258
Rust - - - - - - - - p. 256
beyond 20 or 30 miles from railway not desirable, *Stephen* - - - - - - - - 4036
Uniform grain bill of lading throughout the Empire advocated by common agreement, *Spilhaus* 1772
Yield per acre, *Moffat* - - - - 5527–30
Whites, large class who will not work, *Mackay* 382–4, 408
Windmills, rates from London, New York, and St. John, *Jagger* - - - - - - 1248–9

Wine Industry:
Brandy:
Cape Province, production, 1865–1911, *Moffat* p. 271
Chemical standard:
Abolition advocated and prohibition of making of spirits from anything but wine, as far as Cape Province concerned, *McDonald* - 6457, 6488–93
Objection to, but question of withdrawal under consideration by Government, *McDonald* p. 302
Duties on, and benefit to industry, *McDonald* p. 302, 6464–6, 6471
European market could be more easily created for, than for wines, but question of suitability of quality and need for uniformity, *Thomas* p. 307–8
Excise and customs duties, *Thomas*, p. 307, p. 308
Export of, instead of wine, advantages of, and possibilities of development of trade, *McDonald* p. 302, 6455, 6494–504
France, so-called grape brandy not absolutely pure, *McDonald*, p. 302; *Beck*, 6536.
Increased production of, instead of wine, reason, *Beck* - - - - - - - 6515–7
National guarantee of purity, *McDonald* - p. 302
Prospects of industry, *Beck* - - - 6537
Cape Province:
Exports, chiefly to States in Union, 1913, *Thomas*, p. 307
Large quantity of land suitable, *McDonald*, 6494–5
Price of land, capital required, &c., and possible profits, *Beck* - - - 6527–32, 6567–73
Production, *Moffat*, p. 271; *Thomas*, p. 307.

Wine Industry—*continued.*
Cape Province—*continued.*
Quality of wines, and extract from "Lancet" quoted, *Beck* - - - - - - 6509–10
Western Province, area under vines, and possibility of expansion, *Beck* - - 6525, 6526
Consumption, 1913, *Thomas* - - - p. 307
Consumption and class of consumers, *Beck* 6518–21
Co-operative wineries, established by Government, working of, &c., *McDonald* - - - 6454, 6458–63, 6480–2
Development, possibilities, *Beck* - 6522–4, 6577–9
Excise duties, complaint *re*, *McDonald* p. 302, 6483–4
Export:
Failure of efforts to establish trade and reasons, *McDonald* - - - - - p. 301, 6475–9
no Government certificate of quality, *Beck* 6552
Grading system would benefit, *Beck* - - 6553–7
Preference desired in England, *McDonald* 6472–4
Small amount only, *Beck* - - - - 6511–2
Gin, imported, duty and price compared with Cape brandy, *McDonald* - - - p. 302, 6467–70
Government control, *Beck* - - - - 6550–1
Government would give advice to men starting, *Beck* - - - - - - - - 6574–6
Grapes, table, prices received, *Beck* - 6538–41
Grapes and raisins, large market for, *Beck* - 6523
Grower makes his own wine as a rule, but co-operative wineries started of late years, *Beck* 6542–3
Handicapping of manufacturers, *McDonald* p. 302
Heavy yield from vines, *Beck* - - - 6535
Home demand at present equal to supply, *McDonald* - - - - - - - p. 301
Importance of, as factor in development of country and social life, *Beck* - - - - - 6507
Large quantity of grapes used in production of grape syrup for sweetening wines and brandies, *Thomas* p. 307
Market question, *Beck* - - - - - 6548–9
Prices received by growers, *Beck* - - - 6513–4
Production, *Beck* - - - - 6508, 6544–7
Profitableness, comparison with other forms of agriculture, *Beck* - - - - - - 6523
Retail prices too high, and importance of reasonable prices to industry, *Beck*, 6558–66; *Thomas*, p. 307.
Scope for cultivation, *Beck* - - - - 6507
Scope for land settlement purposes, *Beck* - 6533–4
Setting up of particular type by Government, drawback of, *McDonald* - - p. 302, 6463–4
Small holdings suitable for, and vines could be combined with tobacco and fruit, *Beck* - 6522–4, 6533–4
Traffic carried on railways 1912, 1913, *Hoy* - p. 148
Uniform standard for each brand needed, *McDonald* p. 301, 6485–7
Vine disease formerly owing to phylloxera, *Beck* 6508
Whisky:
Imports, 1909, *Beck* - - - - - 6518
Standards, uselessness of, *McDonald* - p. 302
Wire, barb and plain, rates from London, New York, and St. John, *Jagger* - - - - - 1248–9

Wool Industry:
Blanket factory, *van Breda*, 3507–9; *Oxenham*, 3560.
Caledon district, improvement in quality and increase in production, *van Breda*, 3536–7; *Oxenham*, 3552.
Cape Province, favourable comparison with Australian, in 64 class, *Gasson* - 4689, 4728–9, 4738
Classing:
Difficulty, *van Breda*, 3476, 3533; *Oxenham*, 3597.
Government expert, *Oxenham* - - - 3597
Instruction given at agricultural colleges, *van Breda*, 3534–41; *Oxenham*, 3598–600.
Clip, average, *Bock*, 4548; *Robertson*, 5644–5, 5658–64
Getting-up of:
Improvement and reasons, *van Breda*, 3478–9, *Bock*, 4510.
Instruction by Government experts, *Bock*, 4511–4
Comparison with Australian wool and question of competition, *Oxenham*, 3570, 3593, 3626–31; *Gasson*, 4746–7, 4757–8.
Co-operation would be advantageous, *Oxenham* 3583–7

Wool Industry—*continued.*
no Deterioration if standard kept up in breeding, *Robertson* - - - - - - - - 5648
Decline of industry in Zak River district, *Stephen* 3980–1
Development of industry, possibilities, *Oxenham*, 3572–8; *Gasson*, 4709–16, 4730–2.

EXPORT:
1907, 1912, *F. B. Smith* - - - - p. 177
Bulk goes to Continental places *viâ* Southampton, *van Breda* - - - - - - - - 3542
from Cape Town:
Amount, *van Breda* - - - 3473, 3482
Gradual increase, *van Breda* - - - 3491
no Complaints *re* facilities for bringing wool to ports, *Bock* - - - - - - 4539–40
Direct, to Hull, &c., no advantage seen, *van Breda* 3543–6
from Durban, increase, *Butcher* - - 1680
from East London, 1904–8, *Bock* - - 4498
by Farmers individually, and disadvantage compared with sale locally, *van Breda* 3476, 3493–8.
Freights:
Comparison with Australia, *van Breda* - 3474–5
Comparison with Buenos Ayres, *Wiener* 1450
Satisfactory, if present conditions remain, *Bock* 1557–8
to Germany *viâ* London, *Oxenham* - - 3642–4
90 per cent. to Germany, and style of wool probably not suitable for Bradford market, *Oxenham* 3566–9, 3606–12, 3641–6
Increase, *van Breda* - - - - - 3551
from Port Elizabeth, 1913, *van Breda* - 3482–3
Rates to England, *Jagger* - - - 1274
Shipment by farmers direct, disadvantages, *Oxenham* - - - - - - - - - 3559
Shipping, ample, except at height of season, *Van Breda* - - - - - - - - 3492
to U.S.A., question of effect of duty, *van Breda* 3480, 3502–5
Heavy fleeces, production still continued by some farmers and need for better education, *Bock* 4498, 4515–7
Improvement, steps taken for, *Gasson* - 4682, 4685
Improvement in weight of fleece, *Oxenham* - 3603–5

ORANGE FREE STATE:
Education of farmers, steps taken *re*, *Johnston* 4862–5
Export:
to Bradford, *Gasson* - - - - 4734–7
Less going to London and more direct to factories, *Gasson* - - - - - - 4734
Handling, improved methods, *Gasson* - 4701
Improvement, and possibility of further, *Gasson* 4683, 4687, 4700–2, 4725–7
Improvement, steps taken for, import of stud ewes and rams, &c., *Gasson* - - - 4682, 4685
Industry, injury to, by recent drought, *Gasson* 4684, 4691–6, 4704–7, 4713
Merino wool industry, improvement in quality and quantity, *Johnston* - - - 4759, 4774–7

Wool Industry—*continued.*
ORANGE FREE STATE—*continued.*
Purchase according to quality, but purchase by storekeepers in small country towns, *Gasson* 4682, 4717–21
Output, comparison with Australia, *Gasson* - 4744–7
more Paying than meat, *Bock*, 4536–7; *Woollatt*, 5312–4.
Prejudice against, in London market compared with Australian, *Oxenham* - - - - 3622–5
PRICE:
Better, obtained at local sales than in London, *Bock* - - - - - - - - - 4498
Comparison with Australia, *Bock* - 4549–50
High, 1899, 1900, and subsequent collapse, *Gasson* 4699
Highest obtained during last season, *Oxenham* 3647–54
Improvement, *van Breda* - - - - 3478–9
QUALITY:
Comparison of, in different districts, and effect of soil on, *Gasson* - - - - - 4689–90
Good, *Bock* - - - - - - - - 4498
Improvement, *Bock* - - - - - 4532
Kept up, by sheep from Australia, *Bock* - 4525–7, 4530
SALE:
Auctions at the Coast, *Bock* - 4498, 4510, 4518–9
Auction sales at centres other than at the coast not advocated, *Bock* - - - - - 4520
Buyers able to absorb whole of clip, *Bock* - 4498
Buyers from all over the world, *Oxenham* 3588–90
Date, *Oxenham* - - - - - - 3601–2
Large sales in different centres advocated, *Oxenham* - - - 3554–9, 3588–96, 3561–6
Local buyers could give higher prices than would be obtained by direct shipment to London, *Oxenham* - - - - - 3559, 3614–20
at Seaport towns, *Oxenham* - - - 3620–1

NOTE.—Evidence on the following subjects is printed in Part I. [Cd. 7706.] :—

I. Migration, Land Settlement, and Irrigation.

II. Communications :—

(*a*) Post, Telegraph, and Steamship (including Freights).
(*b*) Bills of Lading.
(*c*) Railways, Harbours, and Coal for Bunkering and Shipment.

III. Empire Development.

IV. Natural Resources :—

(*a*) Animal and Agricultural Produce.
(*b*) Cotton.
(*c*) Forests.
(*d*) Wine Industry.
(*e*) Fruit.
(*f*) Fisheries.

* Appendices are printed at the end of the Section to which they relate.

Previous publications relating to the work of the Commission have been issued as follows :—

MINUTES OF EVIDENCE

TAKEN BEFORE THE

DOMINIONS ROYAL COMMISSION IN THE UNION OF SOUTH AFRICA IN 1914.

Part II.

V.—MINING AND MINING CONDITIONS.

CAPE OF GOOD HOPE.

Cape Town, Wednesday, 25th February, 1914.

Mr. Herbert Warington Smyth, M.A., LL.M., F.G.S., M.I.M.M., Secretary for Mines and Industries for the Union of South Africa, called and examined.*

1. **(Chairman.)** I understand you are Secretary for Mines and Industries?—Yes.

2. Would you make a general statement as to the mineral resources of the Union of South Africa?—I thought it would perhaps help the Commission in commencing their investigations if I simply summarized some of the main features, leaving it to other members of the Department afterwards to present evidence dealing with matters in greater detail. For that purpose, I have brought a small map,† because I think it will help to clear the minds of the Commission as regards what you have before you, and I think I had better first of all group before you the main mineral deposits as they occur on the map. I may remind the Commission that the main mineral output of South Africa is that of gold. For the year 1912, the output was valued at 38,690,000*l.*, and the latest figures which we have just received for 1913 show that the output will have been 37,374,000*l.*

3. **(Mr. Lorimer.)** I see for 1911 the output was 34,000,000*l.*?—Yes.

4. Was the increase from 34 millions to 38 millions in 1912?—Yes. I may say the figures in the draft statement prepared by the Commission, which I have seen, for 1911 should have been 35,049,041*l.* So there was a considerable increase in 1912, and probably that year marks our high-water mark.

5. **(Chairman.)** Are those figures in any printed report?—The last figures for 1913 are not yet printed. Our Annual Report for 1913 will be out in a few months.

6. And the 1912 figures are found where?—In our report for that year. It is interesting to remind the Commission that of the total production only 1½ million is produced outside the Witwatersrand mining area within the borders of the Union, so that the main gold-mining centre is, of course, the Witwatersrand area, including Heidelberg.

7. **(Mr. Lorimer.)** What is the area of the Witwatersrand?—The length of the reef is about 60 miles. I will just point out as we go along the situation of the main deposits on the map. The Witwatersrand is well marked on all maps by the convergence of the railway lines, and it will be noticed that every port is trying to get into direct connection with that central area. That 1½ million which is produced outside, you may say, is produced along the edge of the mountains on the eastern side of the Transvaal. Wherever you enter the country you have to climb up this mountain ridge, or escarpment, to get on the central plateau of the high veldt, and the Witwatersrand is the highest part, at about 6,000 feet, which divides the rivers flowing into the Atlantic from those which flow into the Indian Ocean. Well, perhaps one or two main features with regard to that industry will be interesting. I have only the figures for 1912. Those for 1913 are naturally very extensive and we are not able to get them into proper form until some months after the end of the year. We hope to have our report for last year ready by May, and that will give the latest figures for 1913. But the figures for 1912 will not be altered much for 1913. The tons milled for that output which I gave you were 25,657,000. The value per ton had an average of 28·86 shillings and the working costs 18·75 shillings. Thus, the average working profit was a little over 10*s.* per ton.

8. **(Chairman.)** Can you give us the working costs in previous years?—Yes; I can do so later.‡

‡ *Note.*—The witness subsequently forwarded the following statement:—

Witwatersrand Producing Gold Mines.

Year	Tons Milled.	Recovery per ton.	Cost per ton.
	1.	2.	3.
		s. d.	*s. d.*
1902	3,416,813	42 0	25 9
1903	0,105,016	39 9	24 9
1904	8,058,295	38 6	24 4
1905	11,180,422	35 10	23 6
1906	13,571,554	34 6	22 2
1907	15,523,229	33 11	20 10
1908	18,196,589	31 5	18 0
1909	20,543,759	28 11	17 1
1910	21,432,541	28 6	17 7
1911	23,888,258	27 11	18 0
1912	25,486,361	29 0	18 8
1913	25,628,432	27 9	17 11

* For a statement by this witness as to the South African coal bunkering and export trade see p. 155 of [Cd. 7706.]

† Not reproduced.

9. And the value per ton for previous years?—Yes.* The profits for the year were 12,678,000*l.*, of which dividends were paid to the amount of 7,960,000*l.* There were certain payments for interest and redemption of debentures, 600,000*l.*, and the repayment of certain loans, 800,000*l.* That has to be added to the dividends. An interesting point connected with the gold-mining industry of the country is this—the amount spent in wages was 14½ millions, of which over 8 millions went to white men in wages and 6 millions went to natives.

10. Can you give us the number of each?—I can. The number of white workmen was 24½ thousand. The number of natives I can give later. The amount expended in stores is considerable and amounts to over 10¼ millions. I am referring to 1912. The value per ton is little over 28*s.*, and working costs is 18*s.* The really important thing is to keep those two figures apart, and, owing to the large tonnage of lower grade ores on the Rand, the lower you can get that figure of 18*s.* the greater the tonnage that is going to be opened up. The danger of postponing that day too long is that, when you have to pass large bodies of low-grade ore, you will never, if you leave that mine standing sufficiently long, be able to touch it again. The ground will have moved and that particular body of ore will be a loss to the community. All these facts can be given you in greater detail by the Government Mining Engineer in Johannesburg.† With regard to natives, the actual number at the end of December was 207,600.

11. **(Sir Rider Haggard.)** Did you say 24,000 whites?—Yes. In that month there were 24,500. I may say the general ratio is about 8·6 coloured men to one white man for 1912. That is on the gold mines of the Witwatersrand.

12. **(Chairman.)** Is this the Rand alone or all the gold mines?—That is the Rand gold mines. Next to gold, diamonds is the most important mineral in this country. For 1912, the figure was 10,061,000*l.* value as against 8,746,000*l.* for the previous year. I may say I have the figures for 1913, which show 11,389,000*l.* The diamond output comes from three main sources geographically. Kimberley, where there is a very large pipe or number of pipes. The extension northward of the Vaal River north-east into the Transvaal, what are called the river diggings, and these are worth mentioning because of the superior class of stone which is found in those diggings reaching from 92*s.* to 120*s.* a carat in 1912, whereas mine diamonds in certain areas were as low as 22*s.* a carat; so there was a big difference. The third main area of production is the Premier mine, close to Pretoria. This is just a short distance for the Witwatersrand. It is the largest pipe known and produces the largest quantity of stones, but they are generally of a lower value than those of the Kimberley area. Mention must also be made of a certain number of pipes in the Free State. The Kimberley area is the most productive. There are one or two important pipes in the Free State, the chief of which is Jagersfontein. There are a number of gashes or rents which have been filled with this pipe matter in the Free State, but they have not proved so rich, as a rule, as the true pipe. The Cape, which includes Kimberley and the river diggings, produced a total value of 6,190,000*l.*, the average value being 53*s.* per carat. The Transvaal produced 2,386,000*l.* worth at 22*s.* per carat, and the Free State produced 1,480,000*l.* at an average value of 48*s.* That made the total for 1912. The alluvial diggings on the Cape side and up into the Transvaal produced 990,000*l.* It is not of such importance, therefore, as the other mines, but the stones are superior. Our other most important mineral is coal, and the nearness of the coalfields to the Rand has been a most important factor in its development, and is, of course, of immense importance in the keeping down of working costs of the industry. I will just give you the production from the Provinces. The total value for 1912 was 1,999,000*l*; of that the Transvaal produced 1,020,000*l.* The average value at the pit was 4*s.* 4*d.* That is the lowest price we have. Natal produced 771,000*l.* The Free State produced 141,000*l.* and the Cape coalfield at Indwe produced 41,000*l.* All these figures are in our report for last year, and if you want further details these will be given by the officers of the department as you go round. We then get to much smaller figures. A large number of the minerals mentioned in the form given me by the Commission are hardly found by us at all. Tin and copper are the only important ones. Tin reached to over 360,000*l.*, mostly from the Transvaal. Copper amounted to 556,900*l.*

13. **(Mr. Lorimer.)** Have you copper in the Cape?—Yes. The Cape mines have been working since the seventies. Then right up in the extreme corner of the map, at Messina, there are a large number of old workings which have been opened up, and the present Messina property is very promising. We are in hopes that this is going to make up for the falling off from Namaqualand. In 1912 the Cape output was 507,000*l.*

14. Is it smelted?—It is converted into a matte and taken away.

15. Then 507,000*l.* is the value of the matte?—Yes. The Transvaal output was 49,000*l.* and that is probably increasing. We have a little asbestos, 18,000*l.*, and also some lime, 130,000*l.*, and salt, 63,000*l.*, but otherwise our mineral production at the present moment is not very great. The list will be found in the report.

16. **(Chairman.)** What is the proportion of mineral exports to total exports?—The value of the mineral output for 1912 was 52,711,000*l.* Total exports about sixty-six millions sterling.* Thirty-eight millions was the high-water mark for the output of gold.

17. Is that likely to be exceeded in futnre?—I am inclined to think that we shall not easily exceed that value from the gold mines. A number of outcrop mines are getting near to exhaustion. It is true a number of big properties are coming into production on the East Rand, but it is difficult to estimate exactly what their effect will be. I do not think the increased output from those will meet the diminution from the old producers shutting down, and I think it will prove to be our high-water mark for any period.

18. I have read Statement 7 put before the Economic Commission by the Transvaal Chamber of Mines. Does that represent the best technical view and the opinion of your Department also?—The Government is unwilling to make a definite statement, because we have considerable hope of a reduction in working costs which will open up large areas of ground now unpayable. I may say here that a certain mine is working at 11*s.* per ton costs, and at another to-day portions are being worked at a value of 2·4 dwts. only, and the working costs are actually under that figure.

19. 2·4 means about 10*s.*?—Yes. Costs are as low as 7*s.* 9*d.*

20. Including everything?—Yes. That is quite a recent figure. One has not examined it carefully, but the report has come down to us, and it is a pretty promising indication of what can be done.

21. What mine is that?—The Knights Deep.

22. Is there anything special in the treatment?—I think the details will be better given by the Government Mining Engineer.

23. What do you call the present paying level?—16*s.* to 18*s.* It is estimated that there are about 400,000,000 tons of ore just below that figure.

24. What is the estimate of the tonnage above 18·75*s.*?—Roughly, in existing mines there is supposed to be over 500 million tons.

25. Dealing with Statement 7, which I mentioned just now, was that view put forward recently or has it been the current view of mining experts for some time?—I think it is a new view. Hitherto, I think, there has been a tendency to look forward with the hope of further great expansion, and there has been a great deal of optimism on the part of people who

* *See* Note on p. 1. † *See* evidence of Mr. Kotze; p. 42.

* *Note.*—The following additional figures were afterwards supplied by the witness:—

STATEMENT of value of mineral exports compared with value of general exports for the calendar years 1911, 1912, and 1913.

	1911.	1912.	1913.
	£	£	£
Minerals	45,302,513	49,394,517	51,854,497
General	57,908,214	63,272,743	66,659,552
Percentage of minerals to general	79·05	78·06	77·78

have not carefully examined the data, and lately there have been a number of disappointments in certain sections. Grades have been lower than expected—working costs higher. A number of mines have had to close down. I think a number of the engineers were considerably surprised themselves at the results they have come down to in working out their facts and figures. The gold contents of the Rand are not uniform along the strike, and comparatively great local variations have occurred, leaving room for much difference between calculated and proved values in certain instances, both along the strike and in depth. There is still a good deal of difference of opinion as to whether the estimate is not unduly pessimistic. I think one object of the statement was to combat this too vague and optimistic spirit, and to show that the industry needs a certain amount of nursing. Also, that it cannot be relied on for unlimited taxation.

26. **(Sir Jan Langerman.)** Has it not been your experience that where the theoretical life of a mine is given, in practice that life has to be considerably extended?—Yes. That is one of those things you cannot explain scientifically or foretell with certainty. But there is no doubt that you nearly always find the actual life to exceed the estimated life.

27. **(Chairman.)** What about the continuance of richness in depth?—That is also a matter on which nearly everyone will give a different opinion. My own opinion is that there is a slight diminution in the gold contents. Of course, we know the real outcrops were very rich. Those surface deposits were out of proportion entirely to the main contents. But when you come to the middle deeps and contrast them with the deep deeps, I think, on the whole, the tendency is to meet a slightly poorer grade the deeper the mine.

28. Increased richness on top being due to secondary enrichment?—Yes.

29. What is the extreme depth at which working is deemed to be payable?—There is another debatable point. We have taken, for the purpose of proclaiming ground under the Gold Law, 7,500 feet as the limit. And, as far as we know, that appears to be fairly reasonable. The temperature of the underground rock on the Rand rises comparatively gradually. It is, roughly, a degree for 200 feet, and that is much more slowly than most other countries.

30. **(Sir Jan Langerman.)** You expressed the opinion that there is a falling off in depth. But is not that due to the large stamping power and the use of cyanide—that they are now able to mill poorer rock owing to the large stamping power?—Yes. There is a great deal in that, certainly. It is a factor in the situation.

31. **(Mr. Lorimer.)** Is your constantly increasing production of gold coincident with higher or uniform or lower grade?—Well, we were discussing the question of grade, and I am rather inclined to think the grade is falling in depth. There are, however, factors which enable many to say that the grade is not seriously falling in depth at all.

32. At all events, you have a constantly increasing output and you have a fall in working costs?—We have had an increased output up to 1912. This year shows a falling back slightly.

33. Is the Cape Copper Company's mine the oldest in the Union?—Yes.

34. What was the output of copper for the Cape Company's mine—the average—one year with another?—Last year the total value was 500,000*l*.

35. Is that sent away in matte?—Yes.

36. Do you happen to know whether, as in Australia, there is any gold or silver in the copper? I think practically none.

37. Can you tell me the value of the output in Namaqualand?—500,000*l*. I mean for the two mines—the Cape Copper and the Namaqualand Copper.

38. They are in different parts of the country?—No, close together. Practically the same formation.

39. Is the deposit a large one?—I am afraid not. I am afraid the mineral lenses are getting smaller in depth. They are running east and west. Each one of these lenses during the past few years has been a little smaller than the previous one above.

40. How is the dip?—They are big lenses of ore. You cannot say they have a dip. Well, the general dip of the ore body is to the east. The lenses follow one another down.

41. How far is this mine from the coast?—About 80 miles.

42. You say nothing about iron; but I understand you have enormous deposits in the neighbourhood of Pretoria?—We have possibilities, we think. There are two deposits which, during the past two years, have been looked at and appear to promise well. About four years ago the Government appointed Mr. Harbord to report on the possibility of an iron industry. Most of the iron deposits found up to that time, however, were titaniferous—had titanic acid in them—and it would be found impossible to smelt them satisfactorily.

43. Is there anywhere an analysis of that?—Yes. We have a Blue Book, dealing with the subject, which we published.* But a new factor has arisen since that date. We have found two new and promising deposits in the neighbourhood, one of Pretoria, and the other one to the north-west of Kimberley.†

44. Is that since your Blue Book was published?—Yes.

45. Have you any records of these new deposits?—Yes, we have a report dealing with the hematite deposits in the neighbourhood of Pretoria, which will shortly be published.

46. And of coal you have very large deposits?—Yes. The coal measures are very extensive in the Transvaal and north western Natal, but, unfortunately, in the Cape they are practically absent.

47. Is the iron field in the neighbourhood of the coal?—There is coal near the iron field, but there are certain iron works being erected at Vereeniging, on the borders of the Transvaal and Free State, on the Vaal River. These are readily accessible to the Transvaal and Free State coal-fields.

48. Are the iron works actually erected?—Yes.

49. Blast furnaces?—Yes. Of course, the question will be the market—whether they have a large enough market in this country—and what other markets are available.

50. It is a big expense. In New Zealand they have the same difficulty—splendid iron ore, but no market. Where could you ship?—To South America perhaps. Possibly Australia; possibly to the east coast, Zanzibar and the Dutch East Indies.

51. You are not likely to ship to Australia, but suppose this ore was good ore, and practically free from phosphorus and sulphur; could it be shipped to England as ore?—I would not like to say at this stage, until we have experimented as to the costs of production.

52. And the cost of freight?—Yes.

53. Of course, a very important factor would be the purity of the ore?—Yes.

54. **(Sir Jan Langerman.)** In mentioning that 1912 was the high water mark, you know that from January to July last year there was a scarcity of labour?—Yes.

55. You know also that we had a strike in July, and the native labour on account of that fell off during the second six months?—Yes.

56. Nearly 40 per cent. in fact?—Yes.

57. Would not that suggest that if we had had a full complement of native labour, 1913 would have been better than 1912?—I think it possible, if all conditions were favourable. Of course, if conditions were favourable always, I would not despair of even higher figures.

58. I would not suggest that the falling off in the output is entirely due to a falling off in grade, but that outside influences have had something to do with it?—Quite so.

59. You said we had 12 millions profit. You accounted for 9 millions; what has become of the other three?—I have those figures from the Annual Report; they do not quite agree.

60. Might I suggest that the 3 millions went in capital expenditure?—I think very probably, with profits tax, but at the moment I have not got the figures. I know the question arose in our report, but I cannot turn it up at the moment.

61. You see 25 per cent. of the profits disappear somewhere?—The figures were these: Profits for the

* Blue Book U.G. 21–10. † *See* Appendix II, p. 105.

year, 12,678,000*l*. Dividends, 7,960,000*l*; interest and redemption of debentures 600,000*l*., and loans 800,000*l*. That still leaves a bit unaccounted for.

62. What is the figure which the mines take as a payable limit: is it 4 or 5 dwts. in valuing the reserves, for instance?—They differ. I understand some take 5 and some 4.

63. According to the mine?—Yes.

64. Must there be special conditions which enable a mine such as you mentioned to work ore at 2·7 dwts.?—No doubt.

65. It would not apply to all the mines?—No.

66. In what directions would you suggest that working costs could be reduced?—That is not a thing that I think should really be put to me. It is difficult for anyone to answer at this stage. But there may be factors coming—cheaper power, cheaper labour, less capital costs in certain directions, less expense in inducing native labour to come to the mines, and specially increased efficiency of underground methods and use of the labour force, both coloured and white staffs generally. There may also be other factors, such as improvements in small stoping drills.

67. With regard to the reefs other than the Main Reef series, such as the Free State and Kimberley series, having an average value of 5 dwts. which have never been touched, have you any estimate of the quantity of ore which could be worked profitably, assuming that working costs could be reduced?—No I think the Government Mining Engineer probably has.

68. Because I take it that the ore locked up there is much larger than we have ever taken out of the mines in the past?—Which series?

69. The Kimberley series, the Free State series, the Bird series, which are apart, as you know, from our main and south reefs?—Yes.

70. **(Mr. Bowring.)** Could you tell us, Mr. Smyth, about the quality of the South African coal, which, I understand, is only valued at 4*s*. 4*d*. at the pit?—That is Transvaal coal. I would not like to give figures as to the calorific value off-hand. But I may say the rough position is this. Natal coal is the best stuff we have, from the Dundee District, and a good deal of it is reported on extremely favourably for steaming purposes. Transvaal coal is second in quality is not as good in caloritic power, or in ash, and so on. But the cost of production in the Transvaal is cheaper. We have no gas in the Transvaal mines. They are also very shallow.

71. The coal is fair steaming and poor gas coal, I understand?—Yes; I understand, however, that we shall have fairly good gas coal in Natal in some of the sections.

72. Could you give us any idea as to how it compares with South Wales coal for instance, for steaming purposes?—I have some figures which I could give the Commission.*

73. In regard to diamonds, you say these vary very much in value; is it possible to find a true diamond that does not pay to mine or sell, or is any true diamond worth only 22*s*. per carat?—The Premier Mine is working on an enormous scale, and it pays them to sell at that value. They are recovering a very large number of these small stones, but production has to be on a vast scale

74. It is the size which brings down the cost?—Yes, the scale of working more than the quality of the stones produced In the Free State there are several of these little gash mines which could produce a very good class of stone, but they cannot produce enough of them at sufficiently low cost, and the expenses of working those is so great owing to constant falling of reef, high charges per load—owing to small quantities handled, and so on—that they cannot work at a profit. Quite a number are shut down.

75. I understand that the difference in price of stones is almost entirely governed by the size? And quality. The "water" of the stone really affects the price more than the size. The quality is the more important factor in price.

76. **(Sir Alfred Bateman.)** Is your Department responsible for the statistics originally prepared for the Commission?—No. Those which you have are Census figures.

77. Because, from a statistical point of view, they are not very satisfactory; they are chiefly blanks? I may say that the difficulty in producing statistics on this subject is this: Where you have a highly technical matter like mining, the best statistics are those produced actually, as a rule, by people who have a technical knowledge of the subject, because they give what is wanted to be known. Our statistics published in this annual report, I may say, are more complete than those published in any other country in the world, and what I suggested to the Secretary a little time ago was that, when you have been round and taken your evidence, you will know exactly what you want, and we can then give you everything in tabulated form quite shortly.

78. In regard to gold, and the statement which was published in the London "Times" some months since, was it laid before Professor Chapman's Commission?—Yes, it was. Their report will be out at the end of this week, I understand.

79. Was it merely put in as a statement, or was a witness examined on it?—I understand so, but I cannot say for certain—the procedure was that a statement was put in and the Commission examined on it.

80. In regard to estimating the life of the mines; would the taxation of a mine with a five years' life be in any way less than that of a mine with a fifty years' life? It means that you have a shorter period for the amortization of your capital, but the estimate made by your engineers would be checked by the official of the Mines Department who deals with that subject, and, finally, the lives of mines are always settled by the Minister of Mines on the report of his officials.

81. Not by the owner himself?—No. But we always find that after a period we have to make a revision. I think I may say that when the lives are revised they have been given a longer period of life at each date.

82. We can understand that, from the point of view of wages, it might be an advantage if you employed a large amount of labour and only had a short life, to get these costs reduced; that would be an argument to put before any union you were dealing with: You may say, "If we can reduce costs and get increased efficiency our mine will last 30 years; and if not, only ten"? I do not think it has been used in that way.

83. The estimate you give of 12 to 15 hundred millions is the amount of gold still to be got from the Rand? Yes, in pounds sterling.

84. That is about 40 years' production, is it not?—Yes, more, at the present crushing rate of 28,000,000 tons per annum, but I think the tendency now, after this report, which has been so much discussed, is to say that is an under-estimate.

85. It is no estimate at all—it is almost waste paper, is it not?—Well, it must have been arrived at, I take it, on certain rough but ascertained figures—the average values—the average dips and the average areas and tonnages, and so on, of the various sections of the Main Reef series as hitherto disclosed in connection with the known milling capacities of the mines, and deductions from these

86. Does that appear in your reports?—No We have never bound ourselves to any definite statements in this connection

87. Mr Lorimer asked you about shipping iron to England; I suppose there is one advantage—you want homeward freights?—Yes; but, of course, our mealie export is a thing which is increasing. Agriculture is going on, and I do not know how far in a few years we may go. Possibly, we shall find home freights pretty full up.

87A. It was brought before me seven years ago here that back freights were almost impossible?—Yes, but the mealie trade has developed since then.

88. You do not know whether, economically, it has made a difference in freights?—I could not tell you.

89. **(Mr. Campbell.)** I think you said that the Government Mining Engineer would give us estimates as to comparative working costs and so forth?—Yes

90. You said something in reply to Sir Jan Langerman as to working costs, that they were being reduced. I suppose if it were shown that in Western Australia mines can be worked profitably under equal

* *Note.*—These figures were subsequently furnished for the confidential information of the Commission and are not printed.

conditions by white labour, there is a probability at least that, by different organisation, the costs can be reduced?—I would certainly say that there may be avenues through which working costs could be reduced. I should say that is an argument in favour of the possibility of further reduction. But it is always misleading to argue from one country to another.

91. Still, it does offer a probability?—Yes, I think it is an argument.

92. In reply to the Chairman, you suggested that that much discussed statement in regard to the life of the Rand was produced with a view to showing that the mines could not stand further taxation. Is that further taxation proposed?—No, I do not think so. But perhaps the word "taxation" was unfortunate. But, at all events, I may say "interference"—any tendency to hold back the development of the Rand. Many things are being constantly proposed with reference, for instance, to restriction of native labour recruiting. If you begin to interfere with these matters the industry has to show that you are doing a risky thing—that we have not got a great undeterminable source of wealth to which there is no bottom. We have had the same thing in Natal. People have talked about our immense coal resources. There are two good seams, and excellent quality, but in working them large bodies of coal have been burned and destroyed by dikes, thus largely reducing the available areas of workable coal. The mines are worked recklessly. Only one seam is being worked—the under one. There is a thin partition between that and the upper, which is falling in. That upper seam is being lost to the country for ever, and nobody realizes that it matters. I think it was that kind of view which the Chamber of Mines wanted to combat.

93. Was that statement got up at the instance of the Chamber of Mines or did it originate from outside?—I think the statement was prepared by the Consulting Engineers of the Groups and was put forward on behalf of the Chamber of Mines.

94. Did it originate outside of the Chamber, among the mining people themselves?—Well, of course, the Chamber is a representative body of mining people, just as the Chamber of Commerce is representative of the commercial community. It need not necessarily include all, but it includes the majority.

95. Even looking at the matter from the amended view you put forward, there is a certain amount of suggestion that the report was coloured, and that further enquiry would be likely to show that it need not necessarily be so pessimistic?—I am inclined to put it this way that future enquiry would be unable to get better data to go on, but future experience might show that they were wrong—that they were unduly conservative. I do not think that anyone can get better data than they can at the moment. But in another ten years we shall know far better. I think it is too early to pronounce a definite opinion.

96. What, as a matter of fact, is the system of taxation of the mines here? Is it heavy?—There is a ten per cent. profits tax on all profits made in gold mining.

97. That is levied on the balance sheet?—Yes. As examined by officers of the Revenue Department. There is also a system of what we may call, for the purposes of distinction, rent for mining ground, which is paid under a system of claim licences. The Gold Law is the Act in the Transvaal which deals with the working of mining ground, and under that Act, as soon as the owner or any other person discovers gold on a farm, the Government allows him a share of the farm as his own mining property up to one-fifth, which he can take over and do what he likes with, but the Government takes four-fifths and administers it for him, and allows mining to take place by a system of claim licences. These licences on a private farm are 5*s*. a claim per month where no mining is going on, and where mining is actually proceeding it is 20*s*. a claim per month.

98. Is that four-fifths taken over by the Government and administered as State property?—No. It constitutes a property which can be obtained by any person who conforms to the regulations for the time being; the licences then paid by that person to the Government are not all retained by the Government. Half is repaid to the owner of the property, so that he is represented all the time and gets his share. He gets one-half of the licence moneys. The Government only holds it in trust for the disposal of the mineral rights.

99. Its revenue is derived from licences only?—Yes.

100. The taxation of which you have spoken is levied on the balance sheets of the company, but the profits go to the individual shareholders of these companies. Are they subject also to income tax?—Not in this country.

101. There is no income tax in this country?—No.

102. The double income tax we have heard so much about in England, then, refers only to the profits tax levied on the balance sheets?—I suppose so.

103. There are further systems of taxation of mines here, are there not? Is there not some peculiar system under which the Government draws a very large revenue from the Premier Mine?—Yes; you were dealing with gold mines. We have a separate law with respect to diamonds.

104. Is this peculiar to diamond mines?—Yes. Diamond and base metal mining are dealt with under separate laws. Diamond mining is dealt with under three laws—one for the Cape, one for the Free State, and one for the Transvaal. Under the Transvaal Law passed in 1903, the State takes sixty per cent. of the profits of any mine which is discovered.

105. Of the ascertained profits of the balance sheet of the company?—Yes, and the owner gets 40 per cent. The owner of the mine is allowed to elect whether he will make up his mind to take these terms or not, and if he does not do so, the Government can make other arrangements.

106. I suppose that, compared with other countries, you have the heaviest taxation in the world?—I would not like to say that. I have not examined other countries sufficiently carefully. Of course, as regards diamond mining, that is a very peculiar thing, and it is a unique thing in its way. The Government of the Transvaal, like the Free State and the Cape, all took the line, as regards diamonds, that they were entitled to a large share. As regards base metal mines, our taxation is no worse than any other country.

107. Is there any well-grounded complaint that the heaviness of the taxation on diamond mining limits the extension of the industry at all?—Well, it has been said that in the Transvaal, where the proportion is 60 per cent., persons who are aware of diamond pipes have kept the knowledge to themselves, as they did not want to part with 60 per cent. Personally, I am very sceptical as to that, because, wherever there is any suspicion of a pipe, there is a tremendous amount of excitement, and we have had endless attempts to open pipes. We have never seen any reluctance for people to come forward.

108. You do not think there is anything in it?—If there were I do not think it would be a bad thing. I do not think that an unrestricted output of diamonds would be to the advantage of the diamond industry or the cutting industry or to the trade as a whole, and certain restrictions of output, on the other hand, are in the interests of all connected with the industry.

109. With regard to restricting the output, is there any arrangement between the Premier Mine and De Beers?—I understand not, at present.

110. Do you understand that any is contemplated?—I cannot say that I know officially. I have understood that there was some chance that a conclusion might be arrived at by all producers under certain circumstances, but, as far as I know at present, there is no arrangement.

111. It is being talked about?—Yes—by people outside. I do not know if it is talked about by people inside.

112. As a matter of fact, the present want of arrangement between the two sections of the mining industry has not affected the price of Kimberley diamonds, has it?—No. I may mention that the German South-West Africa Government has now taken over the control of the output from there and is limiting it. Whether there will be any necessity here for any limitation I do not know. De Beers do, as a matter of business policy, constantly restrict the amount of stones they put on the market.

113. You spoke of a special kind of mining carried on in rivers where the value of stones is much higher?—Yes.

114. Is there any very large area either known or suspected for the extension of that river mining?—Well, it is rather peculiar in some ways. From north to south it is quite a considerable area. If you follow the Vaal River from Potchefstroom downwards you may say that diamonds have been found on both sides. On the north of the river, on this side here, it extends up this way 20 to 30 miles. They are found in gravel deposits.

115. In the wash of the river bed?—No. In the gravel lying on the surface or just under. They are shallow in character. The moment you get below Warrenton you get the old Cape diggings. They follow closely the Vaal River as a rule. Some of them—what they call the deep diggings—have 30 feet above them of soil and boulders—and when you go down that depth and reach the river deposit there are enormous boulders, brightly polished, and under these boulders you find the diamonds, so that there are two classes of diggings.

116. Is that river industry of any size—in regard to diamonds produced?—990,000*l.* a year.

117. As compared with 9 millions?—Nearly one-tenth.

118. With regard to coal: you have given the production of coal in values, but is not the coal produced in South Africa mined at a cost which I should think is much below that of any other country?—Yes, I suppose so.

119. And sold at a lower cost?—Yes.

120. So we need the figures of tonnage?—The figures are:—Transvaal, 4,750,000; Natal, 2,765,000; Orange Free State, 525,000 tons; and the Cape, 74,000 tons. These figures are for 1912.

121. On the general question of the preparation of statistics: by what means are the figures as used by your Department obtained? Do you have a special office on the mining fields obtaining them?—We have, under the Act, power to call on any person who is producing minerals to supply these statistics. The head statistical office of the Department is at Johannesburg and under the immediate control of the Government Mining Engineer. You may call it his intelligence department, because there he has all his facts and figures as to values and so on. We issue forms on which we want the information supplied. We do not collect them locally—we get them by post.

122. You have a special mining statistical office for this purpose?—Yes.

123. You are almost able to guarantee the figures?—Yes.

124. **(Sir Rider Haggard.)** I think you told us you employed at Johannesburg 24,500 whites as against 207,000 natives?—Yes.

125. Can you say what is the average wage of whites and natives?—We have a very complete statement in the Annual Report, to which I think I had better refer the Commission.

126. Can you say roughly?—Well, the rate of earning for whites on the Rand per head per annum for 1912 is 330*l.* I have not got the native figures for the moment.

127. Did you not say that 8 millions went in wages to 24,000 whites?—Yes.

128. And 6 millions to the 207,000 natives?—Yes.

129. Would that not be about one-ninth?—Yes.

130. That means that the white man is nine times as valuable as the native?—The white man is employed largely in supervision.

131. You have one white man supervising eight natives?—Yes.

132. Is that recognised as the necessary proportion which the white man should supervise?—I should put it this way. The actual ratio of employment is one white man to eight natives, but in underground work, a man looks after far more. In certain classes of work you employ a white man alone or with one or two boys—say on pump or repair work and so on.

133. Natives, I presume, are incapable of any responsible work?—No. Selected natives are quite capable of responsible work. In fact, in Namaqualand, native boys there are doing mining work of a special character—a very dangerous kind—without an accident occurring once in a year.

134. Then they are not incapable?—No. The raw native from Portuguese East Africa is, of course, straight from a kraal—a rough fellow with a certain imitative faculty developed but no thinking capacity, or very little. But with regard to the coloured man from the Cape, and a large number of Zulus and Basutos, they are quite capable of running a steam hoist, and eventually taking up a class of responsible work. I do not say they are as capable as the best white man, but they are as capable as many.

135. But they are not paid at the same rate?—No. But under the mining regulations in the Transvaal there are certain classes of work which are only allowed to be performed by a competent person, who in the Transvaal is defined as a white man.

136. Is the reason for that the question of capacity, or do other considerations enter in?—I think that is based originally on the estimate of capacity. I think when it was passed by the Union Government it was more with a view to maintaining the *status quo*.

137. Then other considerations entered in?—That particular consideration probably did.

138. Are natives now capable of overseeing other natives?—Yes. There are boss boys—well-known instances everywhere. Exactly how far they are satisfactory I do not know. In many cases I think they are as satisfactory as whites. It depends on the individual himself and the class of work.

139. Supposing such a thing happened that there was a mine where it was quite impossible to get white labour, would it be possible to work the mine with native labour?—Do you mean legally or technically?

140. I mean actually?—With the aid of the ordinary mine staff, yes. I should say so, as in recent instances. Might I qualify that by saying this? In a very highly organised mining industry, such as the Witwatersrand, where all the mining is carried on at high speed under dangerous conditions and the organisation is of a high-class character, you could not tackle a mining problem there with only a native labour force as easily as you could tackle, let us say, a shallow colliery in Natal or a small outside mine in the Transvaal.

141. That is obvious, I think. Now about diamonds: are these pipes in any danger of exhaustion?—There appears to be no symptom at present of any exhaustion whatever.

142. You say coal is being wasted in Natal?—Yes.

143. Are there any regulations to prevent waste?—No, not in this country. There are certain difficulties about objecting to it. The Natal industry has had a rather uphill fight, and, of course, it is difficult to step in and increase their working costs, which is what it means. Also, it has not been the policy of the Government, so to speak, to tell a person how he should work his minerals. A proportion of the managers and mine-owners in Natal are alive to the waste which is taking place, and if they made up their minds to mine that second seam I am inclined to think a good number of collieries could do it. But they have not faced it, on the ground that their own difficulties with regard to working costs at present are sufficiently great. So it is going on.

144. I think you told us something about the proximity of iron and coal: I think you said that the question was how to get rid of the iron ore if it were smelted?—Yes.

145. Has it ever been considered whether it would be possible to institute manufactures?—That is another subject which my Department has had to go into during the past year. The disadvantage we have suffered under has been that there has been no Department actually dealing with the development of industries. My Department began as a Mining Department, and mines overshadowed everything else. It has devoted its whole attention to that particular industry. Other industries have been inclined to suffer in consequence. Recently this portfolio has been enlarged, and it is now called the "Mines and Industries," and the intention is to give more consideration to that aspect. But the question of increased industries in the country is, of course, very largely one, in the first instance, of private enterprise, and where private enterprise has not been able to lead

yet, the Government, of course, has not been able to do anything.

146. But is there any reason—having coal and iron and a cheap labour supply—why manufactories could not be started in this country, as in England?—I may say, in regard to that, it is estimated that we have about 44 millions of money invested in industrial concerns and factories in the country, and there is quite a considerable population, particularly at the coast ports, employed in industries at present. These industries are of a very varied character. But the public I do not think, at present, has realised the importance of the way in which they are growing. In the Cape Peninsula during the last six years the probability is—we have no satisfactory figures—that we have double the number of persons employed. Inland, of course, there is the cost of freight and living, but at the same time along the Rand there is a steady growth of industrial production of various classes.

147. Do you make railway engines?—No. With further reference to this question of yours: we have only got to the length of experimenting. Hitherto, we have had refractory ores. The Government made investigations into various electrical and other processes of smelting, and we were finally beaten by Mr. Harbord's report, which was very unfavourable. Then came the news of these two deposits, but until these are opened up and some considerable amount spent on them it will be impossible to say whether that iron ore can be worked profitably or not.

148. You have a certain class of native who is already skilled in working iron, I believe—the Mashona?—Yes.

149. There would appear to be no difficulty in getting suitable labour?—No.

150. As regards this statement presented to the Economic Commission by the Chamber of Mines, was the life of the mines stated to be sixteen years?—I have not got it by me, but I think it said the present rate of production would show a tendency to fall in sixteen years to about one-half, and then more rapidly.

151. Do you know roughly what proportion of the revenue of the Union is obtained from mines?—Direct and indirect?

152. Yes.—I can give you that.

153. Perhaps you can send it?—Yes.*

154. **(Chairman.)** Can you give the total, direct and indirect, from mines?—The indirect is rather a difficult thing to give, because there are all sorts of questions like railway freights, customs, and transfer duty, all of which business is done at Johannesburg. Various people give various estimates—according to their political views sometimes.

155. **(Sir Rider Haggard.)** Railway revenue is a considerable thing, is it not?—Yes, and customs dues.

156. Do you think it is a half?—It is more. I would rather not give the figures off hand.

157. Is it admitted by all authorities that there must come a time when the gold mines give out—say within a half century?—I think people are of opinion that in another half century there will still be mining going on, but what the production for the year will be I do not know.

158. It must come to an end some time, I suppose?—Well, it is difficult to say—so many mining countries continue in a small way.

159. But if that happened, I suppose South Africa would have to fall back on agriculture?—Yes, and, I hope, the development of its coal and iron measures. That is why markets are an important question.

160. **(Mr. Sinclair.)** When you spoke of the need for lower working cost, had you in mind reduction in wages or improvement in methods?—Largely improvement in methods.

161. Not reduction in wages?—No.

162. The tendency is for wages to increase, is it not, rather than to be reduced?—The tendency, I think I am right in saying, for native wages, has been to increase.

163. You gave your proportions as eight to six, of coloured to whites, I believe?—No, 8·6 to one white.

164. **(Chairman.)** Eight millions paid to white labour and 6 millions to coloured?—In wages.

165. **(Mr. Sinclair.)** Is there to any extent employment of a like character common to both the coloured worker and the white worker?—That brings us to the difficult question of the poor white.

166. Can you assist us by saying whether, as a matter of fact, there is like employment common both to coloured and white labour?—There has been a considerable amount—for instance, work like lashing and tramming underground. Contracts have been given to unskilled whites to do work which is ordinarily done by kaffirs. That is, I think, the case to-day less than in the past.

167. Is the tendency to increase the proportion of white workers to black, or is it the other way?—I should say the tendency as shown by the figures has been very stationary. There has been very little change. The figures for the past few years show on the whole a ratio of seven, eight, nine, to one.

168. Is there much employment of the same class at which both white and black work?—No.

169. Is the work that is done by the black worker in mines done on day wages or is it contract rate?—It is day's pay—or monthly pay in fact.

170. Is there contract work—piece work—in the mines to any extent as far as you know?—Yes. A very considerable amount of contract work is done by whites in developing and stoping.

171. But not by blacks?—No. The black is paid all the time on a daily rate or shift rate.

172. Then contract underground work performed by whites does not come into competition with contract work by blacks?—No.

173. They are on a different footing?—Yes.

174. A word as to coal. Is the bulk of it bituminous coal?—Yes.

175. In regard to the destruction of coal, of which you spoke, does the rental paid on coal include a dead rate?—The coal areas have been in most cases leased by the owners of the mining title to the mining companies. The Government is not taking any rent at all, but the owner of the mining title is taking such rent as he has been advised. In some cases, so much an acre, in others a round sum down for so many years. I cannot give you an accurate statement as to what the method has been in the majority of cases.

176. Does that mean that the worker of the coal mines is not the original lessee from the State?—Not generally. Base metals in this country are unlike gold or diamonds. The State does not come in. It only takes a licence fee in Natal, and a small taxation on profits.

177. **(Mr. Garnett.)** You spoke of several classes of work being reserved to white men?—Yes.

178. Is that on account of the highly technical or dangerous or responsible character of the work?—Yes, for instance, blasting.

179. Would you mind mentioning such as are specially reserved?—In mining work, for instance, no coloured man may do any blasting, or charging-up of holes. That has to be done by a competent man, who is defined as a white man in the Transvaal and Free State. A shift boss who takes charge of a shift must also be a white man; those are two main instances.

180. Roughly speaking, then, it is where there is danger to life and limb that the occupations are specifically reserved?—Yes, for the safety of everyone.

181. **(Chairman.)** This Statement 7, presented to the Economic Commission by the Chamber of Mines: I understand the Department of Mines does not agree with its conclusions. Do you propose to prepare any counter estimate?—No, we do not propose to do so, and we do not at the moment feel that we are in a position or anybody is in a position to give an accurate statement. The Minister of Mines, the other day, gave an answer in the House on that very

* *Note.*—See correspondence on the subject printed as Appendix XIII, on p. 116.

point, which I will send to you. It gives the official view.*

* *Note.*—This answer, which was supplied subsequently, was as follows:—

Statement by the Minister of Mines and Industries in the House of Assembly on February 10th, 1914.

The statement of the Chamber of Mines in respect of the life and probable tonnage of ore to be expected from existing mines is based on data furnished by the individual mines to the Mines Department for the purposes of the Mining Taxation Act. Experience has shown that the life of a mine is rather longer than is estimated, and it therefore may be reasonably expected that the existing mines will yield a somewhat larger tonnage than is indicated in the statement of the Chamber.

The Chamber's estimate that the yield from existing mines will fall to one-half in sixteen years may be looked upon as substantially correct, if present working costs remain unaltered, but it may reasonably be expected that new producers will arise by which the balance will at least in part be restored, while any reduction in working costs which may be achieved during the next few years will be reflected in the larger tonnage of lower grade ore which will be rendered available to profitable mining.

Attention is directed to the fact that estimates of this nature are framed on uncertain data and varying conditions, that it is impossible to forecast to what extent these data and conditions will have varied even in ten years, and that therefore it is not prudent to attach undue importance to estimates which attempt to extend our vision so far into the future.

182. **(Sir Jan Langerman.)** It is only in the Transvaal where there is restriction placed on the black and white workers? Yes, and Free State.

183. In the Cape and Natal all labour is common to both white and black?—Yes, all labour is open.

184. If a coloured man is able to do a white man's work he can?—Yes.

185. It is a matter of competition, but usually the coloured man takes a lower wage for the same work? —Yes.

186. And the kaffir gets his food and housing on the mines?—Yes.

187. And a minimum wage? —Yes.

188. If he puts in so many inches or holes, he draws higher pay?—Yes.

189. He is not a regular paid man by day, but it is according to the task he performs?—Yes.

190. Some kaffirs, I know, on mines I had would earn 6*s.* and 8*s.* per day, according to the number of inches or holes. —Yes, those are hammer boys.

191. If the restriction were taken away from the kaffir to do skilled work would not that be an important factor in reducing working costs?—Yes, no doubt.

Dr. Alex. L. du Toit, Geological Surveyor, Cape Province, called and examined.

192. **(Chairman.)** You are Geological Surveyor of the Cape Province?—Yes.

193. Your functions extend beyond the Cape Province to the rest of the Union?—Yes, recently.

194. Would you please make a statement of the points you desire to bring forward?—I have prepared a short statement dealing with the iron ores, and also with copper and coal. *Statement put in as follows:—*

Occurrence of Iron and Copper Ores in the Cape Province.

A. *Iron.*—The only iron ores in the Cape Province known to exist in such quantity that they may be exploited at no very distant date are those associated with the Lower Griqua Town beds in Griqualand West and Bechuanaland.

The Lower Griqua Town beds* are mainly siliceous rocks containing thin layers of magnetite; the siliceous layers are coloured by limonite and hæmatite. Beyond the fact that they are older than the Devonian system nothing is known as to their age.

They extend from the Prieska division northwards to Bechuanaland, a distance of 270 miles, and are limited on the east by the older limestone formation of the Kaap Plateau, and on the west by the younger Matsap Beds. They occur on the surface over an area of several thousands of square miles.

The Lower Griqua Town Beds vary in character, but in general they are highly ferruginous. A specimen of a banded ironstone from Prieska Kopje gave on analysis 42·5 per cent. of metallic iron.† The bodies of ore known at present are concentrations of the iron from these beds along fissures and in circular or elliptical holes in the underlying dolomitic limestones called the Campbell Rand formation. The bodies of ore are breccias of fragments of the banded siliceous rock cemented together by hæmatite and silica; frequently the silica in the fragments has been partly or wholly replaced by hæmatite.

The largest masses of this breccia are the Klip Fontein Hills, which trend northwards for 28 miles near the village of Postmasburg, and the Gamagara Ridge which extends north and south for about 30 miles near Gamagara, in the Kuruman district. These hills rise to various heights up to about 400 feet above the limestone plain (the Maremane anticline). There are also many isolated hills made of similar breccia, which is called the Blink Klip breccia.

* Accounts of the characters and distribution of these beds will be found in the Annual Reports of the Geological Commission of Cape Colony for the years 1905, 1906, 1907, and 1908; they are shown in plan on the Kuruman, Postmasburg, Griqua Town and Marydale sheets of the Geological map of the Cape Province.

† The figures quoted in this report are from analyses made by Mr. J. G. Rose, Government Analyst, Cape Town.

The distribution of the chief masses is shown on the small scale map attached,‡ and incidentally it may be mentioned that this region is about 420 miles from Johannesburg and 600 miles from Port Elizabeth, the nearest sea-port.

The volume of this brecciated material, varying in character from a low-grade ore up to pure hæmatite, is enormous, and there should be no difficulty in obtaining unlimited amounts of ore suitable for smelting.

No prospecting work has yet been done in this formation. Two of the most important outliers are the Blink Klip Kop at Postmasburg and Wolhaars Kop about 10 miles to the south-west.

Analyses of four specimens broken from outcrops of the two long ridges mentioned above gave 38·1, 53·0, 56·3, and 67·4 per cent. of metallic iron respectively.

Another and more important feature is that the ores, as shown by two analyses of hæmatite from Blink Klip Kop and Wolhaars Kop respectively, are practically free from the deleterious elements sulphur and phosphorus, the figures being under 0·05 per cent. in each case, a most valuable quality in view of the large quantities of low-grade phosphoric ores that are mined nowadays. The hæmatite should, therefore, make a high-class pig iron.

The ore bodies, resting as they do upon dolomitic limestone, could be mined at an extremely low cost, but, owing to the absence from the neighbourhood of any coal, the ores would have to be smelted elsewhere.

B. *Copper.*—The copper mining area of Namaqualand is at present under geological examination by Dr. Rogers with a view to a memoir upon the geology of these deposits, which produce the whole of the copper mined in the Cape Province.

The ores occur in small intrusions of basic rock in gneiss.

In the Insizwa Range, Mount Ayliff, near the Natal Border, ores of copper and nickel are found in an eruptive rock (Norite). Although only a limited amount of prospecting work has been carried out, the occurrence is of a very promising nature and deserves further attention and support.

C. *Coal.*—A short account of the coal supplies of the Cape Province appears in the 2nd volume of the "Coal Resources of the World" (published by the International Geological Congress, 1913).

195. Do you propose to read your statement?—No, but I will give an abstract. These iron deposits are not far from Kimberley; about 420 miles from Johannesburg direct and about 600 from Port Elizabeth. There are two belts of these deposits, one 28 miles long and the other about 30 miles. Each of these is a

‡ Not reproduced.

couple of miles in breadth, so the amount of material is almost incalculable. The Government has under consideration the building of a railway into this area. A few analyses have been made of the iron ore and it contains only a trace of either sulphur or phosphorus—under ·05 per cent.

196. **(Mr. Lorimer.)** But that is not good enough for the best steel. If you have anything over ·03 you cannot make the finest steel?—Well, these are the analyses which have been made provisionally for the Commission in order to determine whether they were to be classed as good ores. The amount of material is so enormous that it is useless to quote analyses without having a large number and without examining the whole area in detail, but sufficient has been done to show that the kind of iron is good and the amount of ore considerable, and sufficient to supply the whole of South Africa as well as to export. The amount of iron runs up to as much as 67 per cent.—anything from 40 upwards.

197. Sixty-seven is not the average?—No.

198. It is the maximum?—Yes, of the samples analysed; but the great bulk of the rock runs from 30 to 40 per cent. very probably.

199. After you have removed the overburden?—This haematite formation builds hills about 400 feet in height. The material can be quarried; there is no real mining. It is a question of blasting the rock and taking it out.

200. **(Chairman.)** How far are your nearest coalfields?—The one in the Transvaal is about 400 miles distant.

201. Is there any prospect of one nearer?—No.

202. **(Sir Jan Langerman.)** Indwe?—No, it would not be suitable for smelting purposes

203. **(Mr. Garnett.)** What is the freight?—I believe about one-fifth of a penny per ton mile.

204. **(Chairman.)** For the purpose of export those are impossible considerations?—It would be about 600 miles per rail, and then the freight by sea in addition.

205. **(Mr. Lorimer.)** Have you dolomite?—Yes, thousands of square miles.

As regards the copper in East Griqualand, on the border of Natal, it has not reached the commercial stage yet, but it is in development, and it is a deposit which contains nickel and a small amount of platinum.

206. **(Chairman.)** Are the prospects good?—They are hoping to float a concern in London at the present moment. Government has granted a lease to a syndicate.

207. What other deposits are there that you have geological grounds for thinking workable?—They are nearly all small, such as manganese, limestone, and salt, and these will be covered by Mr. Smyth's report, so I do not think it is necessary for me to say anything.

208. You do not see any large prospect of mining development outside known areas?—No, not in the Cape.

209. And the Union?—I think the State Mining Engineer would be able to speak more accurately.

210. **(Mr. Tatlow.)** Did you say the Government had decided to construct a railway line to these iron deposits?—They have it under consideration. It has been brought up pretty well every session for many years; it is only a question of a few years longer, I dare say.

211. It has not been passed?—No, but about four different surveys have been made from time to time.

212. But if the exportation of this ore is impracticable under present conditions, how is it proposed to utilise the ore?—There will be no difficulty in connecting this point with Kimberley, Warrenton, or any station on the main line near by, and I think the General Manager of Railways will be able to give more reliable information as to special tariffs.

213. Is it expected that the manufacture of iron and steel will be started when that line is made?—Mr. Smyth has given evidence about the steel works at Vereeniging.

214. Do you know if any capitalists are in the field concerning it at present?—No, this is absolutely virgin ground, and it has never been considered.

215. **(Mr. Sinclair.)** Has the State parted with its interests in the mining deposits?—No, I believe that on Crown land the Crown retains the rights to the minerals and issues leases for the purpose of mining.

216. I ask the question in view of what has been said by the last witness, that in many cases the State has parted with the coal areas? Those are private farms.

217. There has been no reservation of ground there? No, where the property has been sold the owner can do what he likes with it.

218. **(Mr. Garnett.)** How far did you say these iron deposits were from the sea?—About 600 miles.

219. So you are at present 80 miles from the nearest transport by rail and 400 from coal?—Yes.

220. And 600, including the 80, from the sea?—Yes.

221. So, assuming the working of these deposits, it would seem likely that you would have to depend rather on the home consumption: that you would be too handicapped with this long distance to get your smelted ore profitably to the open market?—I have no figures at the moment, but it is quite possible that the railway freight could be reduced to cover it. At present they are bringing Transvaal coal to Cape Town—one thousand miles—in competition with Natal bunker coal.

222. **(Sir Jan Langerman.)** You are not referring in any way to the Transvaal?—No.

223. You expect the State Mining Engineer to say something about that?—I have no personal knowledge.

224. You have no knowledge of Middelburg in the Transvaal, where iron and coal are practically side by side?—No.

225. **(Sir Alfred Bateman.)** Are you in communication with the Imperial Institute in London as regards examining your coal and other mineral deposits?—I understand we have done so with manganese, but I should not like to say in this case.

226. The Union Government subscribes to the Institute and they can be of great assistance?—They have assisted us materially in several ways, chiefly in regard to manganese. But in regard to coal, we have had a lot of analyses made in South Africa for different properties, to the number of several hundred, in fact.

227. Do you send home specimens for their mineralogical collection, as products of the Union?—I do not know if the Geological Survey have, but the Mining Department may have.

228. Has any use been made of the Institute's reports?—Yes. Numbers of people interested in those propositions have made use of those figures and found them valuable.

229. **(Mr. Lorimer.)** I see you mention here that there has been a discovery of copper and nickel in rock form?—Yes.

230. Has that been analysed?—Yes, a number of analyses have been made, and at present a report has been written on it—the engineer being at present in London.

231. What percentage of nickel is there in the rock?—About 3 per cent.

232. And how much copper?—About 2½ per cent.

233. Of course, it is possible to work copper of 2½ per cent. and make it pay, and the addition of the nickel would make it a valuable deposit. What has been done; has there been any smelting?—Not yet.

234. In regard to copper, you say the mining area in Namaqualand is at present under examination with a view to reporting on the geology of these deposits, &c.; but apart from that, is the extent of the copper area well known?—No. The copper-bearing rock occurs in veins in the granite, and it is the location of this rock, both at the surface and underground, that is so troublesome.

235. And all the copper extracted from the Cape and Namaqualand mines is from a deposit of that formation?—Yes.

236. Invariably?—Yes.

237. Has the output been well maintained in recent years?—I believe so.

238. Is there anything known as to the extent of the deposits?—No, it is chiefly with that object that the geological survey has been carried out.

239. I mean the area?—Yes, the area is more or less known.

240. Can you refer us to any publication of your own in which the extent of this deposit is set out?—Not just now.

241. In the meantime it is not possible for us to see in the report, for instance, that these deposits in the

two districts will yield probably so many thousands or hundreds of thousands of tons of copper ore?—No.

242. With respect to this iron ore, you must not think that this analysis represents pure hæmatite. You say the figures are ·05. To be really pure, that is, practically free from adulterant elements, it would be more likely ·005?—Well, the analyst reported that as a trace.

243. Two analyses of a great area like this might mean anything. Are you having a fuller and more careful examination made?—It would be done if thought justifiable.

244. If we are to report on this, we should like to know more than that two analyses merely have been made?—I realise that. The analysis was done specially with the object of finding out whether the deposits were phosphoric or sulphurous.

245. In order to justify us in saying anything about it, you require to make these analyses over dozens of places?—Yes.

Kimberley, Thursday, 19th March, 1914.

Mr. Irvine Rowell Grimmer, Assistant General Manager of De Beers Consolidated Mines, called and examined.

246. **(Chairman.)** You are the Assistant General Manager of De Beers Consolidated Mines?—Yes.

247-8. **(Mr. Lorimer.)** As you are aware, Mr. Grimmer, I have been here a day or two, and the Chairman thinks it desirable that some of the information which I have gathered should appear in the evidence. I propose to ask you about your own Company, its relation to other Companies, and its relation to the diamond industry generally. The De Beers Company in its present form has existed since 1888, I believe?—Yes.

249. At that date it absorbed by purchase all the other mining companies in Kimberley, and created the present De Beers Consolidated Company?—Yes.

250. The price which was paid to the liquidators of those other companies was, I think, 5,338,650*l.*?—Yes, that was for the Kimberley Mine only, that is only one mine.

251. Have you any knowledge of what was the total purchase money?—No; but perhaps in round figures it would be about 8,000,000*l.*

252. I have here a copy of your Report and Balance Sheet for the last year, and from that I find your capital is 4,500,000*l.* I rather wondered how you contrived to pay for these mines out of the capital of 4,500,000*l.* But I understand you had at that time, and for some time afterwards, debentures of something like 5,000,000*l.*?—About 4,500,000*l.*

253. And those have since been redeemed?—Yes, out of profits.

254. Well, in addition to redeeming those debentures out of profits, you have paid about 30,000,000*l.* in dividends to shareholders?—Yes, I think there is a statement showing that somewhere—I have not the figure in my mind.

255. And before declaring these dividends you paid to the Government 10 per cent. as a Government tax on your profits?—That is of late years. It has not always been the case.

256. That amounted last year to something like 482,000*l.*?—It amounted to 426,500*l.*

257. And the market value of your shares at present is something like 30,000,000*l.*, is it not?—Yes.

258. You have five mines in Kimberley, and one in the Orange Free State which is not being worked?—Yes.

259. And you have interests and options in other parts of South Africa?—Yes.

260. For working your mines you employ a staff of about 2,500 white men and 16,000 coloured men?—That is about right. Instead of coloured I prefer to say natives, the word "coloured" in this country has a particular significance; we speak of white men and natives.

261. Of course, when I speak of coloured I include everyone who is not white?—Yes.

262. The production of these mines which you are working amounts to about 20,000*l.* a day?—A little under that just at the moment.

263. That is a fair average?—Yes, in round figures.

264. Your sales last year amounted to 6,297,782*l.*?—I do not know whether those are the sales only or whether those figures include the stock, I think they include unsold diamonds in hand.

265. I do not know how you state it, but it is here shown as the Diamond Account?—It represents the sales for the year less the cost of production of the diamonds on hand at the beginning of the year, but plus the cost of production of the diamonds unsold at the end of the year.

266. Well, now, I have here a book published a week or two ago by Mr. Wagner, which I suppose you would say may be relied upon. I understand the author is a man of repute and that his statements may be accepted?—I have not seen his book, I have not read it yet; but Mr. Wagner is a careful man and I have no doubt any information he gives can be relied upon.

267. I call attention to it because of the total production of diamonds throughout the world in 1912 he says that 95·1 per cent. was produced in South Africa?—I think that is about right.

268. And of all the diamonds produced in the Union of South Africa, amounting in value to 10,061,489*l.*, more than half is produced by De Beers?—Yes.

269. The value of De Beers production he gives as 5,553,865*l.*?—Yes.

270. And of the whole world's production that amounts to 46·1 per cent.?—Yes.

271. There have been difficulties, I understand, in respect to preventing over-production. There is a constant risk that some of the mines will produce their whole maximum output and flood the market and so reduce prices seriously. It has always been the policy of the De Beers Company, I understand, to restrict production to an amount which the market could absorb without unduly depressing prices?—Yes.

272. And you do not always find the other companies so ready to respond to that idea as you are yourselves?—That is so.

273. You sell your diamonds, I believe, to the London Diamond Mining Syndicate?—Yes.

274. And they find a market for your production in America to the extent of 75 per cent. of the whole?—Principally in America. I daresay it is 75 per cent.

275. Now the production of German South West Africa is becoming a conspicuous feature of diamond mining in South Africa?—Yes, a great feature in regard to certain classes of stones.

276. Their diamonds differ from yours in the size, which is very small but the quality is very fine?—Yes.

277. And they are found under conditions which do not prevail anywhere else in South Africa, or indeed in the world?—Yes.

278. They are found in the sand along a seashore that is treeless and practically a desert, is that so?—Yes.

279. And they also belong to separate companies, but the German Government takes a very considerable tax upon their output?—Yes, and I think they exercise a very great control over them.

280. This book shows that, while last year, or rather in 1912, the German South-West African production was 11·7 per cent., in 1913 it was 19·9 per cent. or practically 20 per cent. Do you know, without going into details, if the production is increasing in value so rapidly as that?—I do not know. Their production may have remained stationary and the rest of the world's production may have been reduced a bit; I have not gone into the figures.

281. In 1912 the German production was 1,408,738*l.*, and in 1913 it was 2,953,500*l.*?—I am not conversant with the figures.

282. Apart from that, they are not very serious competitors, I understand, because the class of diamonds they produce is so different from yours, and they find a different market?—They are only competitors with similar classes of goods produced by us.

283. So far as can be gathered from what is said and written, their production is not likely to be so permanent as yours?—I would not like to hazard any opinion on that point; I have no personal knowledge.

284. I suggest that on the ground that they are picking them out of the sand, the accumulation of ages, washed in, I suppose, from a rock under the sea, and it is not at all likely that the washing in will keep pace with the removal?—I do not know if there is any accepted theory as to the origin of these diamonds, and I prefer not to express any opinion.

285. You will find some interesting theories propounded on the point, and the one which appears to present the least objection is that the diamonds are washed in by sea erosion from volcanic rocks under the sea. Having been round your mines, I should like to say that it is quite obvious there is no expense spared to make the equipment as complete and as safe as possible, both above and below ground, and I suppose that is the policy you proceed on?—Yes.

286. And then I have talked with some of your directors and officials about the prospects of the Company, and I find that everyone entertains a very confident belief that the life of the mines will be prolonged for many years to come. I suppose that is the conclusion you have arrived at with all the data you possess and as the result of probing and drilling and boring. You believe that the De Beers Company has a long life and a prosperous future in front of it?—There is no doubt as to the length of the life of the mines.

287. **(Chairman.)** You cannot say what the life is likely to be?—No, I cannot, but I should say 50 years at least, and probably a great deal longer.

288. **(Mr. Tatlow.)** When you say that 50 years is the probable life of the mines, do you mean at something like the present rate of production or a gradually diminishing production?—At the present rate.

289. After 50 years would there be a gradually diminishing production?—I would not like to say that.

290. But it will not end all of a sudden?—No.

291. It will be a gradual reduction?—Yes.

292. Do you look upon 50 years as the actual end of mining?—No, I cannot say that certainly, but I can state with confidence that we have a life of 50 years, and I can hazard an estimate that we have a life of a good many more years after that.

293. Do you find that the demand for diamonds is constantly increasing throughout the world?—It has up to now.

294. Do you think it will be a constantly increasing demand owing to the increase of the world's wealth?—If the wealth of the world grows I have no doubt that the demand will also grow.

295. Diamonds will always be in demand?—I should think so.

296. **(Mr. Lorimer.)** Am I correct in saying that from the first discovery of diamonds until now the value of production in South Africa has been about 200,000,000*l.* sterling?—Yes, I should say that would be about the correct figure.

297. **(Chairman.)** I want you to tell the Commission something about your system of recruiting both white and native labour. Taking white labour first, what is the average duration of the stay of your white miners here?—I cannot say, I have no details as to that, but I can say in general terms that I believe we have from 150 to 200 men in our employ who have been with us probably anything up to 20 or 30 years, and some of them even more. The amalgamation was only in 1888, and the De Beers Mining Company, which was the parent Company of the De Beers Consolidated Mines, employed these men before the amalgamation; therefore, when I spoke of 30 years I am talking of men who were in the service of the various companies before that date. We have also a great many men who have been with us 10 and 15 years. The general position in regard to the white employees is that if a man gets a billet with the Company, he sticks to it. We have no very large wastage, it is comparatively small; I have no figures. We have a great many men who have been many years in the service of the company. We have fathers and sons and, I daresay, in a good many cases, grandsons.

298. The case of men moving away because they are dissatisfied, or because they want a change, hardly occurs here I understand?—Well, not in any undue proportion, and probably less than in the case of a good many other industries in the country.

299. In the course of the year, what percentage of your white staff would you lose?—It is very difficult to say; in some of our weekly returns you may find that two or three men have left and sometimes none at all. If you said about 100 men would leave in a year and be replaced out of 2,500 that would probably be about the mark; about 5 per cent., it is quite insignificant.

300. Do you have a large number of demands for employment which you are not able to satisfy?—At times we have an abnormal number of demands; if there is a depression in any part of the country they are here and expect to get work, and at times we have a great crowd of men looking for work whom we have not been able to employ.

301. Is that your normal condition to have a large number of men who want to be employed and for whom there is no room?—No, not a large number. I daresay we should have six or ten applications every day, and some of those are repeated applications from the same men.

302. Generally speaking, what is your system of payment; is it time payment with a bonus?—The bonus is only paid in certain cases, such as for shaft sinking and the like; generally speaking, we simply pay for the time.

303. You pay a flat rate?—Yes.

304. And that has replaced the previous system, which was largely contract?—Contracts existed only in the underground work.

305. But what has been the effect of replacing contracts with time payment?—Well, I have no definite figures, but we are well satisfied with the results of abolishing the contract system and reverting to time payment.

306. You find the result better?—Yes.

307. Are the men more contented?—They are perfectly contented. Under the contract system a good many men earned large money and others earned less, whereas to-day the average wage would be a little better than in the past.

308. So far as the men are concerned it has equalised their wages to some extent?—Yes.

309. The highest wage is less, and the lowest wage is higher, than formerly?—Yes.

310. What can you tell us regarding the health of the white miners; have you any returns showing the death-rate or the sickness-rate?—I was only asked for that in regard to the natives; I have no record in regard to white men. I have the figures in regard to the natives and I can get the other figures for you from the Benefit Society, if you desire them.

311. Yes, it would be of interest?—I will do so, but it is not a high death-rate.*

312. Do you know if it is a considerably lower death-rate than on the Rand?—I do not know much about the death-rate of whites on the Rand but I should say we are not abnormal; I would rather, however, give you the exact figures and then you can see for yourself.

313. There has been a discussion in other places in regard to the right of dismissal of white employés. Who has the right of dismissal here?—The various departmental managers with regard to men working under them, but, of course, every man has the right of appeal to the Head Office, to the General Manager, who is quite accessible to every man in the Company's service, whatever position he may hold.

314. As a matter of fact this right of dismissal is rarely exercised?—Only in cases of necessity.

315. Numerically, is it very frequent or is it rare?—It is comparatively rare.

316. Turning now to the question of the natives, your compound system here is, I presume, very strict, more so than anywhere else, is it not; the natives are more segregated from the ordinary population than occurs elsewhere?—Yes; they are completely cut off from the ordinary population during the working of their contract.

317. And they are completely severed from their families I presume?—Yes, of course, except that their families are allowed to see them on pay days to get money for their support, but that is under supervision.

318. What is the time during which they are thus segregated, how many months?—Not more than six months, and, in a good many cases, only four months. After their contract is concluded they go out for a week or two, and come back again in many cases; they keep on returning to the compounds.

319. So, then, with the natives as well as the whites you have a large number who have been here on and off for the last fifteen years?- Yes, large numbers of natives; we have boys who have been with us almost from the inception.

320. And you find that your boys return?—Yes.

321. What is the determining factor which brings them back. Is it the comparatively high rate of your wages or the fact that their crops have failed, or that they have no temptation to remain in their kraals?—I suppose it is the inducement of the wages, in most cases. The wages represent a great inducement to the native. I do not know how our wages compare with the Rand, but I do not think that there is very much difference, if you take into account the cost of rations. We pay a fair wage, and in addition there is a little of the gambling element about it. We pay very liberally for any diamonds which the natives may pick up, and do not attempt to steal. We pay 5*s*. a carat for diamonds, irrespective of their quality and 2½ per cent. on their value in addition.

322. What is the total amount of bonuses which goes to the natives on that basis?- I can get you those figures; I daresay it would amount to probably 200*l*. a week.†

323. What is your average daily rate of wage to natives?—It is about 3*s*. 4*d*. or 3*s*. 5*d*. That is the average.

324. With a minimum of what?—2*s*. 6*d*.

325. And the native has to pay for his food out of that I understand?—We pay their wages in cash, in full, and they can buy what they want at the store in the compound; we do not ration them

326. What is your view of the comparative merits of that system as contrasted with the ration system?—Well, as a matter of fact, we do not need to have any views. The law compels us to pay them in cash.

327. But, outside compulsion, which do you think is the better system?—We think that ours is the better system because the native likes to have his money to buy what he likes with it. If you ration him you have a set scale of diet which does not suit all natives; they have their tastes like other people, and I think they prefer to buy what they want. A man may want to buy meat, whereas if we ration them he would perhaps get rice or mealie pap or something of that sort. We think he much prefers to feed himself.

328. What do you estimate the average daily cost of the native's food to him?—About 1*s*. 2*d*. per day for food and clothing, that is about the average they spend in the stores.

329. Contrasted with that, what is the cost of rationing them on the Rand?—I cannot tell you.

330 These stores that the native buys are sold to him by whom?—By the Company.

331. At what price?—First of all I may explain that all the stores sold to these boys in the compounds is bought in the town of Kimberley, every single pennyworth; we do not even go to the Cape Colony for any of our supplies, so the merchants in town have the full benefit of the trade in the compounds. When they were first established we sold the goods to the boys at very low rates, and then we had a deputation of merchants who said to us that when the boys came out of the compounds and bought goods from them they accused the merchants of trying to fleece them because they said that their prices were higher than the prices charged in the compounds. We agreed to meet them in this matter and decided not to sell at such cheap rates. We now sell the goods at the local town rates. The next outcry was that we were making enormous profits, so we were in another difficulty; however, what we do is to sell the goods at about the same rate as charged in town. Sometimes, in the case of meat, to encourage the boys to feed themselves well, we have sold it below the town prices; this was with the idea of getting them to eat meat as much as possible and so keep themselves fit.

332. You find the more meat they eat the more fit they are?—I would not like to say that, but the native is fond of meat.

333. Your answer rather implied that they worked better on meat than on any other diet?—Not necessarily; if they did not buy the meat it does not follow that they would have bought anything else.

334. Do you have any difficulty about preventing the natives from obtaining liquor?—It is impossible for them to obtain it; there are no means of getting it in; they have no communication with anybody outside.

335. Is that a considerable factor in their good work and contentment?—Yes.

336. What difficulties do you have to prevent theft by your employés? Does theft exist to a considerable extent notwithstanding all your precautions?—Undoubtedly.

337. Can you tell us what means you adopt to restrict it?—First of all our mining area and com-

* *Note.*—The following statement was subsequently supplied by the witness:—

De Beers Consolidated Mines, Limited, Benefit Society.

Membership and Deaths—10 years ended 31st March 1913 (Whites).

† *Note.*—The witness subsequently supplied the following figures:—

De Beers Consolidated Mines, Limited.

Percentages paid during the 12 months ending 30th June, 1913, on diamonds picked up in the course of work.

White	...	£3,047 14 9
Native	...	10,945 14 6
Convicts	...	691 12 6
		£14,685 1 9

pounds and depositing floors are enclosed with wire fences, and in the case of the Dutoitspan Mine, where we get most of our big stones, we have a very elaborate system of barbed wire entanglements with electrical contrivances to ring an alarm in case of tampering. In regard to the natives, they are searched before they leave the service of the company. In regard to the white men there is no system of searching, we simply trust them.

338. Your white employés circulate inside and outside the mine freely?—Yes.

339. And you trust to the good rate of pay and to their sense of honesty?—Yes.

340. How many natives does a white man manage?—Well, we have 2,500 white men and 16,000 natives; if you take those numbers you will get a fair average, although all those white men are not employed in guarding natives; there are mechanics in the work shops for instance. You may say there are 8 or 10 natives to every white man.

341. How many are there underground?—Perhaps a little more, but the Mining Regulations restrict the number. It is competent for a mining inspector to say that so and so has too many boys under him, and in that case we have to reduce the number.

342. Is that fixed by law?—The numbers are not fixed by law, it is subject to safe working.

343. Is the proportion altering in any way?—No, I do not think so, I think we have gone on for years just the same.

344. It remains constant?—Yes, there has been no deliberate attempt to alter the proportions.

345. In respect to recruiting, what means do you adopt to recruit: do you incur a large expenditure for this purpose?—No, practically nothing at all; one year we did spend 1,300*l*., but we had practically no recruiting whatever in the ordinary sense. We have three men in the whole country, one in Transkei he practically does nothing at all one in Basutoland, and one in the Bechuanaland Protectorate. Their duties are to collect the natives into gangs and look after them and ration them until they are put on the train.

346. Do you advance their railway fares?—Yes, and we recover from the natives out of their pay. If the boy contracts for four months he has to refund his fare, but if he contracts for six months we will bear the cost.

347. Do you advance anything to his family?—No, we only advance 1*l*. per head for the hut tax, which the Government insists upon their paying. We make no advances in the way of loans.

348. There is no inducement to them to be recruited, in the sense of advances?—To all intents and purposes every boy we get comes to the mine voluntarily.

349. Therefore, comparing your system to the one at Johannesburg, there is a large saving. I think in Johannesburg the cost of recruiting is something like 20 per cent. of the amount of native wages?—I would not like to say; I have no figures.

350. The Economic Commission reported that the cost was something between 20 per cent. and 25 per cent. of the total cost of native labour?—That may be.

351. Do the natives remit home during their four or six months' stay a considerable proportion of their earnings?—Yes, a very considerable amount is remitted through the Post Office

352. Does the Company give facilities for that?—Yes, the Post Office people do it, but we help them in every way.

353. Can you tell the Commission what proportion of the total wages earned by the natives is thus remitted home?—The total amounted to 91,218*l*. in 1913.

354. In regard to apprentices, I think you said just now that a large proportion of your white employees now are the sons of a previous generation of white employees?—Yes.

355. Do you have a large number of apprentices learning a trade or learning the mining business?—Yes, we have altogether somewhere about 350 lads, including such boys as points boys and loco. boys, but I cannot tell you exactly how many are apprenticed to trades, but there is a very considerable number.

356. What facilities do you afford for apprentices?—They get every opportunity of learning a trade thoroughly under competent men, and we have technical classes for them at night.

357. Are those paid for by the Company?—Yes, and we pay the apprentices a wage also ranging up to 2*l*. 2*s*. a week for the last year.

358. What is the period of apprenticeship?—They are taken on between 14 and 16 and serve up to 21 years of age. Before the boy is taken on he must have passed the 7th standard at school, otherwise his application is not considered. If he is over 16 and has passed his matriculation or some other higher standard than the 7th standard we may consider him up to 17, but no boy is taken on over 17, and therefore a boy will have at least four years' training, and the bulk of them have more than that.

359. Do you think that the facilities which you give for apprenticeship are advantageous to your economic working?—Yes, in many cases it is. It assists us also indirectly, inasmuch as we have a good deal of contentment. There is provision made for boys belonging to our people, and when the apprenticeship is finished we send the boys away so as to make room for others, they gain experience elsewhere and in time many of them come back, and we generally give them preference to others, providing, of course, they have shown a desire to help themselves during apprenticeship. In the first instance we send them away to get experience elsewhere.

360. But, on the whole, these apprentices whom you have assisted to train make a return in the sense of good work later on?—Yes, of course, we do get some work out of them during the apprenticeship, such as rough painting, but I do not know if we get full value for the wages paid.

361. You get your full value later on?—Yes, and in indirect ways.

362. We know the amount of direct taxation which the De Beers Company pays to the revenue of the country, but have you formed, or has anybody formed, an estimate of the total contribution to the revenue of the country, direct and indirect, which your Company makes?—Yes, I have a statement here which gives the total, including the Profits Tax, and the figure amounts to 776,000*l*. a year.

363. What does that include? Does it include your contribution to railway charges and rates and customs?—Yes, the railway rates on the stores consumed represents a considerable sum, that has nothing to do with the passenger fares of our employees. There is the Profits Tax. In 1912 we paid 347,500*l*., last year we paid 426,500*l*. That is a direct tax. Then we also pay to the Government quit rents on mining properties, 13,000*l*., Joint Stock Companies Licences, 3,400*l*., Royalty on diamonds from the Kimberley Mine extension, 2,000*l*. I may mention that the mines were originally surveyed and afterwards extended beyond those boundaries, and we have to pay a royalty of 2½ per cent. on the value of all diamonds found on the extensions of De Beers and Kimberley Mines, which averages about 2,000*l*. a year. Then we hire from the Government anything between 1,200 and 1,500 convicts. We relieve the Government of the cost of these men, and in addition we pay to the Government about 3,500*l*. a year in cash, but taking the amount of relief to the Government as regards the keep of these convicts and the amount of cash which we pay, it represents a sum altogether of, say, 53,100*l*., or in round figures 50,000*l*. I think it is a fair thing to take into account the cost of keeping these convicts, which is saved to the Government; they cost us a great deal more than that. They cost us about 50*l*. a year each. Then we pay in registration fees for labour contracts, &c., 20,000*l*. a year. For railage we pay direct to the Government on goods imported 76,800*l*., and we estimate that in an indirect way we pay railage to the amount of 166,700*l*. on goods that we buy from merchants here. In custom duties we pay direct 3,500*l*., and we estimate the indirect payment through merchants amounts to 11,000*l*., altogether making a grand total of 776,300*l*.

364. I suppose it might fairly be contended that even outside that, the taxes paid by the natives indirectly from money you pay to them in wages, proceeds indirectly from you—in other words it creates a considerable amount of revenue for the Government which would not otherwise exist?—Yes.

365. That is your view?—I mean to say if the natives did not make the money here or elsewhere there would be nothing for the Government to get any revenue or commissions on.

366. Can you tell us anything further regarding the co-operation which exists or which might exist with other diamond producers?—We have no arrangement with anybody.

367. You, on the present basis, supply about sixty per cent. of the total production of diamonds from South Africa?—Of the total value—not weight.

368. Yes, we will adhere to values. And the Premier Mine supplies——?—I would not like to speak for them; I have not worked these figures out. I do not know that we can do that except by taking their reports.

369. You have no figures in your head of the proportions?—No.

370. Can you say whether the respective proportions are increasing or diminishing, or whether your respective proportion is increasing or diminishing?—I should say ours must be diminishing. Every new field that is discovered must affect the proportion contributed by us to the total.

371. And I suppose you would say that the distinction between you and the others is that they are working full rate, and you are throttling down?—I won't say that, but we have made it a part of our policy to restrict our production. We could increase our production without erecting extra machinery by 100 per cent., and by erecting other machinery we could do four times what we are doing to-day.

372. But without erecting additional machinery you have now the plant necessary to double your annual production?—Yes, without difficulty.

373. Would that lower the average level of your production, or would you maintain the quality about where it is?—No, the quality would remain where it is.

374. It would not be going from richer to poorer areas in the mine?—No. The mines vary in value, but taking it all over, we get a very fair average.

375. And doubling your production, with your present plant, you could still maintain your present quality?—Yes.

376. And at your present rate of production, you estimate you have still fifty years of life before you?—Yes.

377. That is not ore in sight?—It is practically in sight.

378. Strictly speaking, in sight?—We can demonstrate that we have the ore at present rates to last us fifty years, and then we have no reason to think that we cannot go on for another fifty years perhaps.

379. Using the term in the mining sense, you have, you say, fifty years' production in sight?—I would not say we have developed all that, but we can take our experience in the Kimberley and De Beers mines as a guide. The Kimberley Mine is at present 3,500 feet deep, and the De Beers 2,500 feet. And we have three other mines bigger than either of those, and not one of them is over 1,000 feet in depth, and working on the assumption that the occurrences in these mines are similar to those in the Kimberley and De Beers Mines, we may say with confidence that we have fifty years' life at the present rate.

380. What is your present deepest depth of working?—3,520 feet.

381. What depth do you suppose is possible?—I could not say, but a good many mines in the world are deeper than 3,520 feet and there has been no very great increase in heat down there.

382. What is the increase of heat per 100 feet?—The temperature increases approximately 1 degree in every 180 feet of depth. The warmest mine is Kimberley Mine. The approximate average temperature at this mine is between 87–90 degrees. Some rock and water temperatures, taken on the 3,520 foot level at Kimberley Mine, were 96 degrees and 98 degrees respectively. The rock temperature will vary considerably with the seasons and also with the amount of ventilation.

383. Is it assumed that these deposits go down to an indefinite depth?—As far as we know, there is no indication whatever of any bottom to the mines.

384. So the limit of working will not be the shute or pipe pinching out, but the heat will become too great for men to work, or the cost of haulage and so on will be too heavy to make it a payable proposition?—Yes, those are the factors.

385. Are there any others?—No; just the question of depth of working for a human being and the question of hoisting.

386. So, if you assume that the heat does not become excessive and the cost of haulage is not too great, there is no reason why you may not work down to 10,000 feet?—We have no reason to give why the mines should not go down to 20,000 feet or even 50,000 feet.

387. In your deeper workings, do you have to adopt any special means for ventilation or cooling?—No, not more than at ordinary depths. We have ventilating shafts—up cast and down cast, and we occasionally have to instal a fan to improve the movement of the air, but we have no difficulties of any kind.

388. It would be of interest if you could give the Commission a little more detail in the form of a written statement about what you said just now—that certain workings have gone down 1,000 feet and the possibility of their going down to the same level as the deepest?—Perhaps if I gave an extract from the speech made by our chairman at one of our annual meetings, dealing with this question, it would probably supply what you want.*

389. Yes. What do you say regarding the probability of other diamond deposits being found in South Africa?—I do not know. It is very difficult to say. I can give you an instance of what happened here to my knowledge. The principal four mines here were discovered in 1870, and a good deal of prospecting went on round the country for years afterwards in the neighbourhood of these mines, and it was not until twenty years afterwards that another mine was discovered within two miles of one of these four. And even then the discovery was only made through a mere accident. A prospector saw some indications of diamondiferous ground thrown out by an ant bear, and he followed it up, with the result that the Wesselton Mine was discovered. That is within two miles of the other mines which had been working for twenty years. So although there may be many rich mines in the country it does not follow that they are going to be found.

390. To what do you attribute the greater stability of underground labour here, both white and coloured, as compared with labour in other places—I mean the men staying longer, and returning?—I would not like to compare it with other places. But I take it that the policy we have pursued all these years has had some effect in that direction. From the General Managers downwards, and also as regards the directors and everyone else, the policy has always been to be fair and just to the men and pay good wages. The industry demands that we should pay good wages, because there is a great deal of temptation, and fair dealing should be given to the men. If any man or any body of men have grievances we encourage them to come and lay them before us and we will discuss them, and use our endeavours to remove them if they are legitimate grievances. We are willing to argue the matter out with the men, and if we find that they have a fair case, we set

* *Note.*—The following is the extract referred to:—

The original surface area of De Beers Mine was 622 claims, and of Kimberley Mine 470, a total for the two mines of 1,092 claims. The lowest working level of the former mine is 2,040 feet, and of the latter 2,520 feet. These mines have been working constantly for over 36 years, and have still a long life before them. The surface areas of Wesselton, Bultfontein, and Dutoitspan are, respectively, 1,162, 1,753, and 1,777 claims, a total area of 4,692 claims, or about 4½ times as large as Kimberley and De Beers combined. Although an enormous amount of work has been done in these three mines by individual diggers and companies in years gone by, there is in sight over 50 million loads of blue ground above the 500 ft., 600 ft., and 750 ft. levels.

ourselves to remove the grievances. On the other hand, if we think the grievances are not justified we generally manage to convince them of that, and they go away satisfied. Whether a man be a tally boy or miner or anything else, he is free to come to the office and see the General Manager or the Chairman of the Company and put his case before them, and we will make all proper investigations into it.

391. Does the fact that you are alone and isolated as compared with mines that have other mines alongside make any difference in your favour or against you?—I should not like to say, but I should think that, as the whole of the mines are under one management, it has some effect. There is no temptation to shift about from mine to mine, nor is there any inducement held out by one mine manager to draw away a good man, and such like cases, which occur in other mining centres.

392. On the other hand, I suppose it may be said that a large market is usually cheaper than a small one?—I suppose that is so. Because where there is a large market, naturally people would rather go there, because there would be more scope or opportunity than in a confined market.

393. In other things the large market is usually cheaper?—Yes.

394. It might militate either for you or against you?—Yes.

395. **(Mr. Campbell.)** In reply to the Chairman, you said, I think, that there was no arrangement between De Beers and any other mines. But has any arrangement been contemplated, or is any new contemplated?—Not to my knowledge. I know of no idea of any kind. But I daresay if any groups care to approach each other they would listen to proposals. But I do not know that even any preliminary step has been taken.

396. Could you say, in regard to the Premier Mine, which I suppose is your largest competitor, whether any restrictive policy for the sale of diamonds is carried out?—I should think you had better ask them that question. It is hardly fair to ask me to express an opinion in regard to other mines. I can only say what our own policy is.

397. Assuming that there is no restrictive policy carried out by the Premier Mine, has that in any way affected the diamond market in the past?—I think it must naturally follow that if any producer produces an unlimited quantity of diamonds and produces together with other people more than the market requires, that must affect the market.

398. Would you object to say what is the cause of the difference in price between the Premier diamonds and the De Beers diamonds?—No, it is a matter of quality.

399. Their price being about half, roughly, of yours?—Yes, but I do not think it is quite half of our average all round.

400. Of course, you have had practical control of the diamond market since 1888, and have had a fair experience of the working of the restrictive policy. You have had fluctuations in the demand for diamonds during that time, I suppose?—Yes.

401. Could you say from what those fluctuations arise?—Well, a good many years back, in the early days, before the amalgamation, and before there was control of the market, and before the diggers had a sufficient capital to work on, a digger had to sell practically from hand to mouth in order to be able to pay his wages on Saturday night, and he had to take what he could get. A digger may have had 100 carats, and have to sell those to a buyer for £100, whereas his neighbour, who had more capital and could afford to hold out, might get £150 for the same quality and quantity. So there was no control of the output and no control of the prices.

402. I am speaking of the market since you have had control of it during 25 years: there must have been periodical fluctuations arising from one or more causes: is it fashion?—No. It is just the spending power of the consumers—the amount of money available for the purchase of stones.

403. The diamond being looked at from the point of view purely of a luxury?—Yes.

404. But it is as a matter of fact an investment, is it not?—I believe that a great many Americans invest in diamonds rather than take a fixed deposit at a bank, with the idea that they can always realise on them whenever they want cash.

405. Have those fluctuations been very violent?—No. Except that about five or six years ago, in 1907 and 1908, there was a very sudden drop in prices of diamonds, and that lasted for a considerable time, and then recovered almost as suddenly.

406. Due to what?—To the state of the trade in America.

407. In the event of a world-wide depression, the market value of the mine would diminish considerably?—I have no doubt.

408. What is the ratio of cost of production to market value of the diamonds?—One can only say that in regard to any particular year. Cost of production is fairly steady, but the ratio would vary with the selling price.

409. You cannot give that figure?—I cannot say exactly, but you could work it out for the last year from the balance sheet you have here, and from the figures you have there in the profit and loss account. Those figures would enable you to get at what you want, I think.

410. You could not say, roughly, what is the percentage of cost of production as compared with the market value?—No. I should just in a rough way say that the cost of production is about one-third of the value. That is to say, the value is about three times the cost of production. You will probably find that is somewhere in the neighbourhood of it.

411. You have a very big margin?—Yes.

412. We have heard it said that, on account of the peculiar taxing arrangements now existing in respect of the new finds of diamonds, this has a retarding effect on the industry. I understand that the Union Government, in regard to new diamond finds, exacts a rate of taxation that is in force on the Premier Mine, for instance, is that not so? Or rather that 60 per cent. of the new diamond field is reserved by the Government to be dealt with as it pleases?—No, that is not quite right. In the Transvaal the Government is a partner to the extent of 60 per cent. It is not taxation at all in the proper sense. In the Free State the Government share is 40 and the owners' share is 60 per cent., and in this Colony it is 50 and 50.

413. Those would be the rates on discoveries of new fields?—Yes.

414. It has been suggested that pipes have been discovered, but the existence of them is concealed, for the time being, in the hope that this heavy contribution to the State will be altered? Do you think there is anything in that?—No, I know of no such case.

415. As to the life of the mine, I suppose you can judge much more accurately of the life of a diamond mine than of an average mine such as gold, silver, or copper, because of the pipe formation, which gives you a fairly good guide as to the volume of the lode?—Yes, generally speaking.

416. You could give a much more certain estimate in respect to your mine?—I should imagine so.

417. In regard to the efficiency of native labour for mining, have you any data at all showing what is the difference, if any, in the relative efficieney of the white miner for the removal of ordinary material and the native miner?—You are assuming that the white miner does the work himself?

418. Yes, I am thinking of the possibility of your being reduced to white labour.—No, because we have never had such a condition of affairs. White labour here is simply supervising.

419. From what source do you derive your men, specially? Is it in the Union?—Practically the whole of it from British South Africa.

420. That includes Rhodesia and Bechuanaland?—Not from Rhodesia. But Bechuanaland, Basutoland, and the Transkeian territories in the Cape Colony. Practically nothing from Portuguese territories.

421. Is there any objection to labour being had from Portuguese territories?—We do not want it; we get all we want as it is.

422. Has there been any objection raised to getting labour from those territories?—From the point of view of quality I do not think there is any objection. Probably they would be just as good.

423. In regard to the supply of stores to the compounds, you said that at one time the Company supplied them practically at cost price, and since then they have supplied the goods at town prices, which apparently represent a different figure. And judging from what you say, the Company has no wish to take a profit from dealing with the natives. Would there not be an alternative in the supply of these stores to the natives at town prices, to charge the same prices as now, but to use the profits for the purpose of paying compensation in the case of accident or death to the natives or their relatives. Would that not be a policy which would suit the company's conscience as well as the merchants' objections?—It is in existence now.

424. But you do not use the profits for that purpose?—When we pay compensation or supply medical comforts and hospital accommodation and food for the injured and ill, we do not actually charge those expenses against the profits of trading, but it would be a fair thing to say that the native does benefit materially from the profits we make on sales to him.

425. I was suggesting that it would be a policy which would relieve your consciences and also obviate the merchants' difficulties?—We have a direct charge of 10,000*l.* against the profits, which is distributed among the public institutions in the country. But in the compounds, we have very elaborate and well-equipped hospitals where the natives who are ill or suffering from accident get their medical attention free, and free food, but no wages, of course. I say it would be quite fair to say that that is an application of the profits. Then in the case of an accident, resulting possibly in death, the compensation we pay to the native or his relatives is on a very liberal scale. The law compels us to make some compensation, but we exceed the legal maximum by a very large amount. For instance, in one year, the compensation assessed by the Government officials would probably be in the proportion of 40*l.* to 800*l.*, and we pay the higher amount. The law limits the amount of compensation, but we pay many hundreds more than any man can recover by law.

426. You spoke of convict labour; I do not think you gave the proportions that you use?—Well, the numbers vary. We have anything from 1,200 to 1,500 men.

427. What is the arrangement with the Government?—Well, we feed them, clothe, and guard them, and take off the Government's hands all this expense, and in addition we pay the Government a certain sum in cash. It comes to about 3,500*l.* a year.

428. Is there any amount paid to the convicts themselves—to be paid on release?—Only amounts they get in the case of receiving an injury. Then we compensate them at the time of their release. If they find diamonds we credit them in the book with 6*d.* a carat. The free labourer gets about 5*s.* for the same thing. But we would not be allowed to credit them with any excessive amount. But on their discharge this amount is paid to them.

429. Cost for cost, do you get as much work out of the convict labour as the free?—On the whole it is as good. We only take long-sentence men, and once they are trained they are there for a good many years without any further teaching. I think we do not take anything less than six months, and we have several ten years and even more.

430. Do you have any serious trouble in regard to that kind of labour in the way of an outbreak?—No, nothing that has not been settled in an hour or so.

431. **(Mr. Sinclair.)** A good many questions I intended to ask have been put by others, but there are a few further questions I should like to ask, first of all, about the distribution of the Company's wealth. You told us that the Company's capital consisted of four-and-a-half millions?—Yes.

432. How many shareholders are there in the Company?—It it impossible to say, because the bulk of the shares are bearer shares.

433. There is no register of the individual shareholders in the Company?—Only of the holders of registered shares.

434. Are you able to give the approximate proportions of shareholders who live outside the Union and those who are resident here?—No, I cannot; but the bulk of our shares are held in England and on the Continent.

435. It follows from that, does it not, that the bulk of the shareholders of the Company do not live within the Union?—Yes.

436. And can you give us approximately the proportion of the annual dividends that are distributed to shareholders who live in the Mother Country?—I think that could be got for you.*

437. It bears closely upon the question of the Empire distribution of the Company's wealth?—I doubt very much whether it could be done with any very great degree of accuracy. The Continental shareholder hands his coupons to his banker and these are remitted to London and presented for payment, and we have no means of knowing where they come from.

438. You have told us that the bulk of the shares are held in the Mother Country and on the Continent. Could you say what proportions approximately are held in the Mother Country, on the one hand, and, on the other hand, on the Continent?—I do not think so. I do not see how we can possibly do that, for the reason I have given already.

439. You cannot help me to a closer statement of the proportion of shareholders who live in the Mother Country and those who live in other parts of the Empire?—No, I should think it would be a matter of impossibility for us to say.

440. We may take this, I suppose, as being approximately accurate: that a very large proportion of the annual earnings of the Company is paid in the shape of dividends and goes to the Mother Country?—All I can say is that a very large proportion is paid out in London, but whether it remains in England or goes elsewhere I do not know.

441. That is as close as you can get?—Yes.

442. And those who get their dividends in the Mother Country presumably largely spend the income derived in the Mother Country and pay taxation on that income there?—Yes.

443. As to the machinery which is in use by your Company; most of it, I think we learned yesterday from an inspection of the workshops, is imported?—Yes, the tools and such like, because there are no industries of that kind here.

444. And the well-equipped buildings that we inspected are used chiefly, are they not, for the purpose of repairing?—Yes.

445. Will you tell us what is the country of origin of that machinery?—Practically the whole of it comes from England.

446. I think you have given the numbers of those employed in the mines?—Yes.

447. And, in addition to those that are directly supported by the Company, I take it a very large number of individuals are indirectly supported through the same source?—Families, yes.

448. In answer to the Chairman, you said that you would supply figures as regards the death-rate of white workers in your mine?—Yes.

449. Have you any figures which would show by comparison with other mines what the longevity of workers in your mine is?—I have no figures relating to other mines. I have a statement here regarding

* *Note.*—The witness subsequently supplied the following figures with regard to the dividends paid in respect of the year ended June 30th, 1913:—

	£	*s.*	*d.*
Amount paid in the Union of South Africa	162,848	15	0
Amount paid in London	2,512,151	5	0
Total Dividend paid ...	2,675,000	0	0

the death-rate among our natives which I can hand in.*

450. What I was leading up to was the question of the longevity of workers in your mine as compared with other similar mines in the country, if I could get the information?—I do not know whether it would meet your requirements if I say that we have no disease or anything detrimental arising from the work in the mines as mines.

451. From the thoroughness that the Company does everything, it goes without saying that it does everything in its power to improve the conditions of the worker, his surroundings, and to promote his general health?—Yes, it is our constant endeavour

452. What I wanted to get at, if I could, was, what working in a mine such as yours really involves. Am I right in assuming that the chief disadvantage from which workers suffer in the mine, if they do suffer at all, is from blasting operations?—Naturally, any blasting that vitiates the atmosphere must affect men if they go down to work too soon, or no means are taken to remove the poisonous gases.

453. In so far as dust is concerned, that does not trouble you from the nature of your working, but the other evil that does affect workers in some mines is the consequences of blasting. May we take it that your Company does everything that is reasonably possible in order to minimise the unavoidable evils that must arise from blasting operations?—Yes, we do a great deal more than the law could compel us to do.

454. You have not so far been in a position to collect information which would throw light on the comparative longevity of the workers who work in your mine?—No, I have some figures, I think, in regard to the ages of our men which may be useful, and which figures are divided into periods, say up to 30, 40, 50, and 60, prepared in connection with our Benefit Society.†

455. That will throw some light on the question, no doubt?—I will supply it.†

456. You told us, I think, earlier in your evidence, that the Company has in its employ workers that have worked in the mine for considerable periods?—Yes.

457. Does it not follow from that that you have workers in the mines—I am speaking now of the native workers—who would be affected by the blasting conditions—does it not follow from that that a proportion of them must be well advanced in years?—Yes.

458. Can you tell us, generally, are the natives who work in your mine young men, middle-aged men, or approaching the elderly?—There are a great many quite young men. The only restriction we make is that we won't take picanninis. The law forbids us to take anybody underground under the age of 16 years, and, as a matter of fact, very few of those are any good to us. There are a few for whom there is a certain class of work, but the bulk are adults.

459. Is there a substantial proportion of those workers over, say, 40 years of age?—I would not like to say that. You can see for yourself to-day when you visit the mine the class of men and their ages.

460. I am not sure if I could tell their ages. However, those who are engaged in the compounds have to remain there for a certain fixed period?—Yes, four to six months. Those are the contract periods.

461. Do you find that many of them renew their employment when they leave the compounds, without an interval?—No, I think comparatively few do that. Most of them would go away for a few weeks.

462. Would it not be the case that the interval between those courses of employment would be in favour of the health of the worker and tend to prolong his life?—That seems to assume that there is something detrimental in their work in the mines, but I do not think any of the health returns will indicate that the men suffer in any way from their occupations in these mines.

463. The official records, so far as they exist, prove that the men are working under sound conditions?—Yes.

464. Now as to wages: you told us, I think, that the average wage earned by the coloured worker was 3*s.* 4*d.* a day. It is not possible, I suppose, to give any comparison between the wages earned by the coloured and those earned by the white, for the reason that the white man does not do corresponding work?—No.

465. Can you give the Commission any information as to the proportional increase of wages paid to black workers in your mine during, say, the last ten years?—I do not know that our wages have varied in any appreciable degree during that time.

466. Has the tendency not been upward as it has been in other parts of the world?—I do not think so. I think we have always paid much about the same wages as we pay to-day.

467. That would seem to suggest, would it not, that the cost of living, which has gone up so greatly in other parts of the world, has remained fairly stationary here: I am speaking now more particularly of the native worker?—The native comes here with the idea of making so much money. For instance, he does not look at it quite in the same way as a white man. He would not take into consideration the number of hours he has to work in the week, but he would calculate how much money he would get at the end of the week, and he would make up his mind that he would take so much money home, and would feed himself accordingly. So I would not like to say that there is any relation, as far as the native is concerned, between the rise or the fall in wages and the cost of living.

468-9. So that the trend has not been appreciably upward?—Not as far as native wages are concerned.

470. What is your opinion as to wages in future? Do you think that the trend will be upward?—I would not like to express an opinion in regard to that.

471. Is the native, generally speaking, satisfied with the pay that he receives?—He would not come back if he were otherwise than satisfied, I think. At any rate, there is no sign of any dissatisfaction.

472. There is no evidence of any movement towards combination?—None whatever.

473. Generally then, we may take it that they are satisfied?—Yes, I think they are from what can be seen.

* *Note.*—This return was as follows:—

De Beers Consolidated Mines, Ltd.

Native Death Rate per 1,000 from Diseases and Accidents.

Year.	Average Daily Number attended in Native Hospital.	Pneumonia.	Death Rate per 1,000.	Other Diseases.	Death Rate per 1,000.	Total Deaths from Diseases.	Death Rate per 1,000.	Accidents.	Death Rate per 1,000.	Total Deaths from all causes.	Total Death Rate per 1,000.
1907	20,376	318	15·61	154	7·56	472	23·16	58	2·85	530	26·01

† Not reprinted. The figures show that the average age of members on April 1st, 1913, was 36·12 years.

474. Now, as to accidents: I suppose that records are kept of accidents that occur in the mines?—Yes, every accident is recorded, certainly.

475. Is your mine inspected periodically by an officer appointed by the Government? — There is a resident inspector of mines in the town, and he visits the workings continually.

476. He periodically inspects the mines and the working conditions, and presumably makes reports to the authorities as to what he finds the conditions to be? — Yes, and he investigates every accident that happens and every breach of the regulations. We have to report to the Government every accident, and send elaborate returns in connection with our labour every month.

477. Are inquests held?—In the case of fatalities occurring, yes.

478. So the inspector makes his report, and in addition to that there is an inquest and an official enquiry held by the magistrate?—Yes.

479. **(Mr. Campbell.)** Is there any taxation on the Company, as a company, in the United Kingdom?—Not now. There was, up to a couple of years ago. We had to pay the usual income tax. It does not exist any longer because we altered our trust deed so as to remove any basis for taxation. We did not think it fair that as our profits were made here we should pay English income tax. Shareholders, of course, pay it still on their dividends.

480. **(Chairman.)** You did away with your Managing Committee in London?—With the Board of Directors holding meetings there. A great many companies have committees in London and they are not subject to the tax, but if you have a Board of Directors sitting as a Board in London, you are liable to pay income tax.

481. **(Sir Jan Langerman.)** You estimate the life of your mines simply by analogy?—Yes, to a great extent, and to a certain extent on absolutely ascertained data.

482. Because one mine has gone to a certain depth you consider that the others will also go to the same depth?—Yes, that is in addition to absolutely ascertained facts.

483. Have you bored at all to find out?—No.

484. What is your experience of the value of the mine? Has the value improved or decreased in depth? —Our published statements show that, compared with near the surface, our mines are poorer to-day than they were then.

485. What is your system of benefit societies here for the workmen?—We compel every man to join the Benefit Society when he enters the Company's service, and the contribution for men in receipt of over 11*s.* a day is 6*s.* per month, and the Company contributes on the £ for £ principle. There are varying rates for lower wages. I can put in a copy of the Benefit Society's rules showing all this information in detail.

486. **(Chairman.)** Yes, I should be glad if you would.*

487. **(Sir Jan Langerman.)** What are the benefits? —They get sick pay, hospital expenses paid, travelling expenses and a coast allowance for living down at the coast according to the class of medical certificate they receive, and they receive also special relief where cases are dealt with on their merits, such as, for instance, where a man's wife has been sick, or his children, and they are ordered away to the coast; but the amounts are entirely in the discretion of the Committee, whereas the other benefits are fixed by rule.

488. Do the widows benefit at all?—No, it is nothing in the way of a pension scheme.

489. They come under the Workmen's Compensation Act?—Of course, we are subject to that Act.

490. Who manages this Benefit Fund?—It is managed by a Committee consisting of representatives of the different Departments of the Company. The Chairman of the Society is the General Manager or the Secretary of the Company.

491. The men have no representation, have they? —Oh, yes, there is a representative for every Department. For instance, each mine has its representative.

492. Is it elective?—Yes. The men elect their representatives. Each Department has its own direct representative.

493. What does the Company do towards housing the men?—Principally, the men look after themselves, but there is a village at Kenilworth which was built by the Company, and I have a statement here which will give all information for you. There are 125 houses, all occupied, and the rents are as follows:—17 houses at 2*l.* per month, 56 at 2*l.* 10*s.*, 19 at 3*l.*, 23 at 3*l.* 10*s.*, 1 at 4*l.*, 6 at 5*l.*, 2 at 8*l.*, and one at 12*l.* 10*s.* There are also 42 single rooms, 16 only occupied, at 10*s.* per month, inclusive of water and sanitary fees. The population consists of 179 men, 169 women, and 213 children. Electric light is installed free. Current is supplied at the rate of 4*d.* per unit, with a minimum charge of 1*s.* 6*d.* per £ rental monthly. A fixed charge of 2*s.* 6*d.* per month is made on the single rooms. Filtered water is supplied for domestic purposes at 4*s.* per house per month. For garden purposes, 3,000 gallons of unfiltered water is supplied monthly free, in excess of which amount a charge of 5*d.* per 100 gallons is made. Sanitary and dust removal is free. The cost of maintenance of houses for 1913 was 4,776*l.* 10*s.* 11*d.*, against a gross revenue of 4,365*l.* 11*s.* The total cost of erecting six new houses was 5,380*l.* 17*s.* 2*d.*, and the cost of installing the electric light was 3,494*l.* 0*s.* 2*d.*

494. Have you a system of boarding houses on the mines?—We have one at Wesselton, which is rather away from the town and is a considerable distance for the men to come and go to meals. We have built a boarding house, and the caterer in charge is paid by the men 30*s.* a week, I think, for board and room.

495. And you control the affair?—We lay down the amount that he can charge: he cannot exceed that.

496. In regard to the cost of kaffir labour: you say it is between 3*s.* 4*d.* and 3*s.* 5*d.*?—Yes.

497. Does that include recruiting fees?—No, that is wages.

498. And food?—No, we pay their wages and they feed themselves; we do not supply food.

499. That 3*s.* 4*d.* is including his food?—We have no other expense than that: that is the full wage. Our recruiting is practically nothing.

500. On the Rand it is 3*s.* 3*d.*, which includes recruiting expenses and feeding. So that you are not far out: you are about the same?—I should say we paid better, because your recruiting expenses are very heavy there.

501. What is the arrangement as regards the convict labour feeding, and so on?—We have a station built, which is run by the Government officials, paid by the Company. There is a superintendent and officials appointed by the Government. It is run practically as an ordinary Government convict station, except that the prisoners have a few greater benefits than they would get at the ordinary station in the way of better food so as to fit them for the hard work.

502 And they work the same as the free labourers? —Yes, there are none in the mines: they only work on the surface, not underground.

503. Nothing beyond what the ordinary free labourer does on the surface?—That is so.

504. Altogether, they have a good time compared with the ordinary prisoners?—They have to work a great deal harder, but they are fed better.

505. **(Mr. Tatlow.)** In regard to the wage of 3*s.* 4*d.* for the native workman, you said it was the average?—Yes.

506. And the lowest 2*s.* 6*d.*?—Yes.

507. You did not tell us how high you went?—They go up to 5*s.* and 6*s.* I will show you the wage sheets to-day at the compound and you will see the wages paid to each boy.

508. Does it mean that the man who receives 6*s.* a day does superior work to the man who receives 3*s.* 4*d.* a day?—No, that is contract work—piecework.

509. In regard to native recruits, you said that you paid the fares of those who contracted for six months?—Yes.

510. Is that irrespective of the distance from which they come?—Yes.

511. They come very long distances?—Yes, hundreds of miles.

512. Is there any reduced fare?—I think there are special fares for the boys coming in batches. A single boy would not come at the same rate as twenty or more.

513. If they come in small numbers do they pay the ordinary fare charged to the general public?—No.

* Not reprinted.

I think there is a special fare for natives travelling as they do, because there is special accommodation provided for them.

514. What is about the greatest distance they travel?—We get boys 350 miles away from beyond Mafeking, and they come from the Transkei, Pietersburg in the Transvaal, and from Basutoland, but probably the greatest distance they travel would be between three and four hundred miles.

515. Do a large proportion engage for six months?—Yes.

516. It is a consideration to them when they travel a long distance—the railway fare?—Yes, I take it so.

517. **(Mr. Lorimer.)** When I was in the Company's workshops yesterday, I saw, of course, a great many coloured men—I do not know how you would classify them—but I want to ask, is it a fact that these men, or any of them, are of the same race as those in the mines?—Do you mean the native? There is a great deal of difference between the "coloured" man and the native.

518. The men who work in the mines, are those natives?—Yes.

519. Have you any natives in the workshops?—Yes, about 300.

520. So that the compound system is not intended to effect a segregation of races?—No.

521. But to ensure a minimum loss from theft?—Yes, and to ensure that you have sober men to start work on Monday morning.

522. With respect to what was said about the hospitals, I suppose you get a daily return of the number of men in the hospital?—Yes.

523. Do you happen to remember what the average is?—I should say about one per cent.

524. Do the men who are unfit for work necessarily go to the hospital, or do they remain in the compound?—A great many are treated for minor complaints in the compound. If a man has a headache or such like ailment he is treated in his bunk.

525. The doctor sees them in their compound?—Yes.

526. In regard to the apprentices—do you train these boys to special trades; do you train them in mining exclusively, or in mechanics exclusively, or chemistry exclusively?—Not chemistry. But all the trades such as mining, carpentering, fitting, blacksmithing, electrical work, and so on.

527. And you employ qualified teachers?—Yes.

528. And do the boys pay for that training?—No, we pay them for the work they do while being trained. They pay no premiums of any kind.

529. A good boy is encouraged in that way?—Yes.

530. You said in the course of your evidence that the amount paid directly and indirectly by the Company to revenue was over 700,000*l.* a year?—Very nearly 800,000*l.*

531. But you do not call that taxation?—No, except, of course, the profits tax, 426,000*l.* That is a direct tax on our profits.

532. Your Company owns its own explosives works?—Yes.

533. How much of the output do you use on the mines here?—About 12½ per cent. is used here.

534. And do you find a market for the remaining 87½ per cent?—Yes, at Johannesburg principally.

535. Do you ship any of it outside of South Africa?—A small proportion is sent to Australia, but nowhere else.

536. **(Chairman.)** You said the mines were getting poorer in depth; can you say at what rate?—The fall in value has been very, very gradual indeed, and it varies a good deal. Sometimes it will jump up, and then go down, so that it is impossible to set any rate whatever on it.

537. But there is a distinct falling off in depth?—Yes, our published accounts will show that.

538. In answer to Mr. Sinclair, you said there was no tendency to increase the rate of pay for black labour. Would you say the same in regard to white?—No, our wages to white men have been increased at different times. There has been an increase in our rates, especially to miners, and within the last six months there has been an application for a further increase, coming after an increase which had been made only a few months before.

539. Compared with fifteen months ago, can you say what the increase has been?—Yes, in some directions. We are paying our qualified miners to-day in the chambers 22*s.* 6*d.* a shift, and a few years ago for similar work we paid only 16*s.* 8*d.* In shafts we pay 25*s.*

540. As compared with what?—That was always well-paid work. I do not think there has been much change there.

541. On the surface?—Wages vary in regard to the different classes of men, but practically there has not been the same increase on the surface that there has been in regard to the actual miners. I have a list here of the wages paid for the different classes of work.*

542. I notice in your balance sheet you put Investments in Stocks and Shares at 1,339,000*l.* and in Reserves Investments 1,932,000*l.* There is a total block of 3,200,000*l.* Do you publish details of these investments?—No, but they are often referred to in the Chairman's speech.

543. **(Mr. Tatlow.)** You gave your rate of wages per shift?—Yes.

544. What number of hours does a shift represent?—Underground, eight hours for natives and whites.

545. **(Chairman.)** On the surface, 10, is it not?—You can roughly call it 10. It varies a little. In the workshops it is a 54-hour week, on the surface works and floors, for odd jobs, we call it roughly 10 hours.

546. And underground it is eight hours face to face, not bank to bank?—Yes, face to face.

547. What do you calculate the difference between face to face and bank to bank?—Anything from a half to three-quarters of an hour.

548. **(Mr. Tatlow.)** Is the work underground going on continuously?—No. At present we are working only two shifts underground and one hoisting shift. We break ground for 16 hours and hoist for eight hours.

549. **(Chairman.)** Is there any other point?—I had a list of questions here, but I think you have covered them all. There is a question here—How many shafts are working? I do not know whether that is a mistype for "shifts"?

550. No, it comes into the proportion of total output?—We are working four mines at present, and one is standing idle and has been for the last five or six years, in pursuance of our policy of restricting

* The lists were as follows:—

Europeans.—Wages.

	Per Shift.	Per week.
Banksmen, Cagemen, Onsetters	13/4-16/8	—
Blacksmiths	16/8-21/8	—
Boilermen	16/8-20/0	—
Boxmen	16/8-22/6	—
Carpenters	16/8-21/8	—
Electricians	13/4-20/0	—
Engine Drivers, Man Engines	20/0	—
,, Winding Engines	23/4	—
,, Underground Hoists	16/8	—
Fitters	16/8-21/8	
Guards	—	£3 10/0-£4 10/0
Guards, Head	—	£5-£7
Machine Men (Washing) ...	16/8-23/4	—
Miners	16/8-22/6	—
,, Shaft Sinking	25/0	—
Moulders	20/0	—
Overseers	12/0-14/8	—
Painters	13/4-20/0	—
Platelayers	16/8-20/0	—
Pumpmen	13/4-16/8	—
Riggers and Wiresplicers ...	16/8-20/0	—
Timbermen	16/8-20/0	—
,, in shafts	22/6	—
Unskilled Whites	10/0-16/8	—

Natives.—Wages.

Underground—

General Hands and Drill Boys ...	2/6-5/0 per shift.
Machine Drill Boys	"Waugh" Drills, 4/0 per 80 feet. "Flottmann" Drills, 4/0 per 80 feet. Shaft Sinking Rock Work, 4/6 per 3 feet.
Loading Boys	22/6 per 100 loads.

Surface—

General Hands	2/6-4/6 per shift.
Loading Boys	12/0 per 100 loads.

the output. There is a question about the nationality of white employees. That is as follows:—English 31·4; Scottish, 7·9; Irish, 3·0; Welsh, 0·8; South African, 52·8; European, 1·1; American, 0·4; Canadian, 0·0; Australasian, 0·9; others, 0·9. You also ask how many men are employed by the different departments and what are their principal occupations I can give you a résumé, as follows:—Technical staff, 89; Farms staff, 24; Clerical staff, 157. Other white employees:—In mine, 669; surface washing plant, 671; surface workshops, 832; surface, sundry, 436; various, 59; Total, 2,937.

ORANGE FREE STATE.

Bloemfontein, Saturday, 21st March, 1914.

Mr. G. E. B. Frood, M.A., M.I.M.M., Inspector of Mines in the Orange Free State, called and examined.

551. **(Chairman.)** You are Inspector of Mines in the Orange Free State?—Yes.

552. In that capacity, what are the principal mines you inspect?—In this State we have only diamonds and coal.

553. The largest diamond mine is Jagersfontein?—Yes, that is the largest mine we have. Altogether, we have seven diamond mines working.

554. All producing?—Yes.

555. Jagersfontein is much the largest?—Yes.

556. And in the way of coal?—We have five collieries producing coal.

557. What is their total output?—The total output of coal for last year amounted to 609,973 tons.

558. Is that output increasing?—That output is on the increase. It has been increasing of late, and I think it is likely to increase in future.

559. What is your large colliery centre?—Vereeniging.

560. That is in the Transvaal, is it not?—The town is on the other side of the Vaal River, but the coal is on this side. There was a large colliery at Vereeniging, which was the pioneer colliery in the Transvaal, but that failed, and what coal was left has proved to be very broken and useless, so they have come across the Vaal River and are opening another pit on this side now, and leaving the other side alone altogether.

561. Where is the market for Free State coal?—Principally at Johannesburg, but a large quantity also comes this way for household purposes. The railways do not take any.

562. No coal is exported or used for bunkers?—No, our quality does not run to that. It is not the best steam coal.

563. How does the quality compare with Witbank?—I think, if you took 10½ to 12½ you would be near the respective qualities.

564. What is the total diamond production for the Free State?—For 1913, we turned out 504,756 carats of a value of 1,676,756*l*.

565. How much of that was from Jagersfontein?—I should say there would be about 350,000 carats. I am afraid I have given a rather rough figure.

566. Are you acquainted with the labour conditions at Jagersfontein?—Yes.

567. What is the staff employed there—white and native?—At present it averages about 800 white men and about 8,000 natives.

568. Do they get an adequate supply of labour, both native and white, as they require it?—Yes, very easily.

569. At what rates of pay?—At Jagersfontein the native rate is round about 3*l*. 5*s*. a month, not including rations. The mine rations the natives itself.

570. That is about 2*s*. a day?—Yes.

571. What is the ration in your opinion equivalent to?—I think there has been a very considerable change in regard to the rations lately, and that matter is now regulated by the Native Affairs Department. Owing to this recent change, I am afraid the figures in my mind are not very accurate.

572. The change has been in what direction?—Towards improvement. The object has been to lay down the native's food on a more scientific scale.

573. In increasing the amount and the quality?—Yes, and I think more particularly in the direction of securing a more varied diet. The diet on our mines has a very limited range.

574. Have you formed any opinion as to the relative merits of the two systems—that of rationing the native employees and that of giving them money in lieu of rations to buy what they like? That is the De Beers' system?—I cannot speak as to the way it works at Kimberley, but I believe the system has proved disastrous in this State at times. If you allow boys to ration themselves, the tendency, as has been proved on several occasions, is for them to neglect their food in order to save as much money as possible. I have heard that this has led to considerable mortality, on one occasion in particular, but that was before my time.

575. I take it you have no personal experience of that?—No.

576. How far back is it?—I have been in this State for nearly eleven years.

577. Within your own experience, have there been cases of natives who were free to buy their own food and the system was found to be unsatisfactory?—In my time we have not had a single case, except perhaps very small matters which did not attract my personal attention. On our mines, the system has been entirely one of the Company rationing the native.

578. Is the official view of your department in favour of that as compared with the other system?—That, as I have explained already, is rather outside the sphere of my department. It comes under the Department of Native Affairs.

579. And you are not prepared to say what the Government view is regarding the health and mortality either on the diamond mines as a whole or the Jagersfontein in particular? Have you any figures that you can give us?—Yes. Our accident rate for 1913—that is our mortality from accidents—was 3·16 per thousand per annum, which is larger than in any year since 1905. Our mortality down here is very small, usually between 1 and 2 per thousand per annum, from accidents alone.

580. Now putting accidents and illness together?—Our mortality from disease during last year was very slightly over 21 per thousand per annum.

581. And previous years?—It has been going up and up. Lately we have been having a good deal more of underground mining, and there is no doubt whatever that the increase is to be attributed to this cause. It is in a peculiar degree due to underground conditions; that is the conclusion I have come to, at any rate. Lately we have been having a very large increase in underground work, especially at Jagersfontein, and the result of that has been a large amount of pneumonia. I have seen the total mortality (disease and accident) figures for the whole of the Free State as low as about 12 per thousand per annum against our present 24, and that has been mainly due to the increase of pneumonia.

582. Have you taken any special steps to deal with this increased mortality?—That, of course, has been the great trouble on the Rand also—this question of pneumonia. As you may possibly be aware we have just had a visit from two eminent authorities who

have been investigating this subject of mortality on the mines. The Chamber of Mines at Johannesburg got out, in the first place, Sir Almroth Wright to report on the matter, and they have since had Colonel Gorgas.

583. Did he come to your mines?—No, he did not.

584. Regarding the health of the white employés, have you any figures?—No, I have no special figures. It may be taken that the death rate among the whites is much less.

585. But, surely, in the diamond mines the character of the dust is less dangerous than in the case of the Rand?—Yes, that is so. That is a matter that would affect the question of miners' phthisis. I would point out that one of the greatest dangers we have to contend with in cases of pneumonia among the natives is that they are most unwilling, unfortunately, to be sent to hospital or to be taken away from their work at all, and it comes to this that, when natives are detected to be suffering from the disease, it is often too late to do anything in the way of curing them. Considerable pains are taken to detect this disease, but, as I have just stated, owing to the reluctance of the natives to lay up, it is most difficult to deal with it. The disease is generally so far advanced that it is very often a case of certain death. The number of deaths is extremely large in proportion to the cases. They do not want to be detected, and do their best to avoid it.

586. What is their motive?—I suppose they do not want to lose the money. They know that if they go to hospital they are going to be there for some time, and if they are detected as looking ill they will be kept under observation for some time. If the mine authorities see a boy is looking bad they put him in a room and keep him under observation and see if anything develops.

587. You say there is no difficulty in getting as many natives as you require?—There is no difficulty. The diamond mines seem to have a peculiar attraction for them, much more so than the coal mines. In regard to those in the north of the State, we have to compete with the Transvaal for labour, and we have the same difficulty as they have.

588. Why is that?—I think I may fairly claim that the diamond mines have taken particularly good care of the natives in the past, and the rewards which the mines allow for the discovery of stones are also an attraction to the native. They allow a certain sum for any stones which the natives pick up in the blue ground on the floors or in the mine.

589. Do the mines in the Free State have to spend large sums in recruiting?—As a matter of fact, our total recruiting charges in the Free State for twelve months do not run to more than perhaps four or five shillings each boy—a very, very small thing compared to what is necessary in the case of mines in the Transvaal.

590. And your coal mines?—They have to pay large sums proportionately.

591. Do they recruit by themselves or join the Rand Association?—They join the Association.

592. What is your view regarding that system of recruiting?—It comes very little within my experience. Two collieries are practically the only mines in my whole district which get boys from this Association.

593. Have you any views on the comparative merits of the flat rate, with or without bonus—a time rate as compared with the system of contracts?—Do you mean as regards native labour?

594. As regards native labour, yes, or as regards white labour also?—As regards white labour it scarcely comes within my experience, as we have practically no contracts. As regards native labour, we have a great deal. Truck loading and drilling are both done to a large extent by piece work. It seems to work very well. The natives like it, and they work better. I can detect no evil in the system at all.

595. **(Mr. Lorimer.)** I suppose your duties are to see that the mining regulations are duly observed?—Yes.

596. And over what area does your duty take you?—The whole of the Free State.

597. And you have seven diamond mines and five coal mines working?—Producing.

598. And are those at all near each other, or are there good distances between them?—Great distances.

599. Have you a staff of assistants?—No, except the office staff.

600. Are you single-handed?—So far as inspection goes.

601. I suppose that involves constant travelling on your part?—Yes, I suppose I am travelling from 12 to 14 days in each month.

602. Your headquarters are here?—Yes.

603. Do you find that the mine owners are willing and anxious to assist you in every way they can to keep the mines in good condition?—Exceedingly so.

604. I was in one of the mines in Kimberley and I was struck with the excellent ventilation. On that point I suppose you are entirely satisfied?—Yes.

605. What is the depth of the mines worked at Jagersfontein?—Within the last two years it has been changed over from the open mine to underground mining, and now it has become entirely underground.

606. Formerly, you had surface working?—Yes, in the open down to a depth of 720 feet. I suppose it was the deepest open mine in the world at the time it finished.

607. What is the greatest depth you are now working?—The main level is 900 feet, but we are now opening out to a depth of 1,600 feet.

607A. And the coal mines?—The principal ones run from 150 to 400 feet.

608. I noticed you said that when the boys rationed themselves, they neglected feeding and the mortality increased?—I said that had been the experience in this State before my time. I have been here eleven years and there has been nothing of that sort during my time.

609. In the diamond mines in this State the boys are rationed, are they?—Yes.

610. What was said to be the reason for the change?—I think that in the case of some mines in this State they always have rationed them from the start.

611. At Kimberley we were told the boys preferred to ration themselves and they found the results quite satisfactory?—I have no doubt that is the case at Kimberley.

612. Your percentage of fatal accidents is 3·1 per thousand?—It was last year: it has been exceptionally high of late.

613. On the other hand, your mortality from disease is 21 per thousand. Is this excessive?—We consider it is. We have been accustomed to lower figures. We get a very healthy class of native here.

614. And is pneumonia the worst disease?—Yes, much the worst.

615. Does pneumonia attack them shortly after they begin to work? I mean to say, do they seem to get resisting power after being months with you? Are the pneumonia cases the ones who have quite recently come to work?—I have enquired and I do not think they have been able to differentiate.

616. One would think that the change of conditions would make it effective at a very early stage?—Yes. In regard to other diseases it was the case. I do not think it has been so remarkable with pneumonia.

617. I should think that after being down there three months and getting acclimatised and accustomed to the conditions, he would be less likely to catch pneumonia. I think you said you had nothing but diamonds and coal?—We have some small things, such as salt, of which we produce a considerable amount from salt pans.

618. No copper or tin?—No.

619. Is there any gold in this State?—Yes, we have some reefs, but it is not found in payable quantities.

620. **(Mr. Bowring.)** Have your coal areas been thoroughly prospected?—No.

621. So that you have no idea of their extent?—No. We hope that a geological survey may come in this direction within the next year or two. But so far there has been no systematic prospecting.

622. You are of opinion that they are of considerable dimensions?—Yes, we have an enormous coalfield—undoubtedly the second largest in South Africa.

623. Is the output becoming greater annually?—It is increasing slowly.

624. Your output at present being about 700,000 tons?—Yes.

625. And the quality is similar to the Transvaal?—No, of second-grade quality only.

626. Valued at how much at the pit's mouth?—About 5*s.* 6*d.*

627. And it is mostly consumed in the provinces?—An appreciable amount comes down south for household purposes, but very little is used in the mines. A considerable quantity goes to the Rand for steam purposes. A very large power station has been started at Vereeniging which, I suppose, will take about 30,000 tons a month.

628. Where does that power go to?—It is distributed on the Rand by the Victoria Falls Power Company.

629. And your diamond mines, I suppose, are not fully prospected either?—It is like looking for a needle in a haystack. An enormous amount of prospecting has been done and an enormous amount still remains. So far as *systematic* prospecting for diamonds is possible, it has been well done.

630. I suppose mines might be found accidentally at any time?—Yes.

631. The surface indications of diamond mines are not very plain?—No, they are very indefinite. We have indications on an enormous number of farms.

632. Are there any diamonds found on the surface?—No, except at the alluvial diggings.

633. Are there any alluvial diggings in this State?—Yes.

634. But they are not very important?—No.

635. **(Mr. Tatlow.)** Pneumonia has become a terrible scourge?—Yes.

636. And the workman goes on until it has reached an advanced stage?—Often, yes.

637. Once the workman incurs this disease, is it always fatal?—No; but I must say that an unusually large proportion die.

638. If it is taken in time, is it curable?—I understand it is a matter of the course of the disease and the system attacked.

639. Is there no periodical medical examination of the men which could discover it and prevent it getting to such an advanced stage?—Yes, there is; but you can understand that a boy does not want to be detected, and will straighten himself up when passing the compound gates, and if he does not want to be detected he can generally manage it.

640. Does the medical examination come within your province and to make necessary regulations?—Everything affecting underground conditions comes within my province.

641. Including conditions of health?—That is rather a divided responsibility. The Native Affairs Department would take control of the matter generally, but if they were in a position to say they believed that the bad health was due to underground conditions, I suppose the responsibility would fall on us. At any rate, we see to the matter of ventilation and everything else like that that may affect the native's health.

642. And also that the medical examination is properly carried out?—I understand it is done, but, personally, I would not take any special steps in regard to that.

643. You do regard 21 per thousand as a very high death-rate as applied to a community of miners, where the men are usually at the healthy age of life?—Yes, and considering that we get a very healthy type of native here.

644. You cannot compare it to the death-rate of an ordinary town or city where the population includes old and young?—No.

645. You said the boys were paid 2*s.* and rations—does that include everything they require in the way of food and drink?—Yes.

646. Does it include tobacco?—At Jagersfontein they used to allow tobacco, but I do not know whether they do now. I have seen the time they allowed the boys either a tot of brandy or some tobacco.

647. **(Sir Jan Langerman.)** Have you the closed compound system here?—We have it at three out of the seven mines, or rather four.

648. Why not at all?—The conditions vary as regards the danger of losing stones.

649. Are not the chances of stealing diamonds equal on all the mines?—No. The more diamonds there are in the ground the more chances of stones being picked up.

650. The closed compound system was introduced for the prevention of theft?—Yes, mainly, and also because it operates towards the better control of the natives, which is very important.

651. They cannot get drink?—No.

652. But it is curious that two or three of the mines should not require that system?—I must explain those are small places, comparatively, and they do not seem to have thought it worth while. I do not think for a moment they would argue against the principle.

653. There is a large amount of disease through pneumonia. You would not regard that as an occupational disease?—I am afraid, as regards boys underground, we should.

654. But it is not brought about by their occupation, such as miners' phthisis?—I think it must be regarded as caused by the conditions of their occupation.

655. Have you any system of change houses and covered ways from the compound to the mine to prevent their catching cold?—Yes, everything that can be done is done, and the mines are only too anxious to be further instructed in the matter.

656. You have covered ways from the mine to the compound?—In the Jagersfontein they have a tunnel at a depth of 60 feet from the mine shaft into the compound.

657. And change houses as well?—Yes.

658. And yet you cannot cope with the disease?—It is not decreasing.

659. And you consider this is due to their occupation?—It is associated with it. When we find, say, 20 cases coming from the mine and only two from the surface, we must regard it as associated with their employment.

660. You do not think there is any chance of their catching it on the surface, by being careless after coming up from the mine?—That is possible, but not probable.

661. **(Mr. Sinclair.)** Who appoints the medical men who make these examinations?—The companies themselves.

662. Is there no medical officer appointed by the Government to undertake that work?—We have a medical officer of health here. There is the Government Medical Officer of Health for the whole State, and the figures in regard to disease are brought to his notice. Monthly statements are forwarded to him.

663. But I want to know is there no responsible medical officer appointed by the State to examine the natives to see how the disease from which they suffer is progressing?—Well, as I have already said, his attention is drawn to it, and it becomes then a matter for him to give attention to the subject. And in the Transvaal we have a Medical Inspector of Mines, whose duty it would be to look into very bad cases. The figures are brought to his notice.

664. To begin with, the majority of boys who go to work in the mines are young?—Yes.

665. Are they absolutely free from pneumonia when they go to the mine?—They are medically examined before being allowed in the mine

665A. Who conducts that examination?—The Company's medical officer.

666. You told us that the natives endeavoured to shirk exposure of their having contracted pneumonia. Is there any systematic State examination periodically of these men while they are employed on the mine?—The boys are carefully examined as they come out and in, and their appearance is noted. If anything suspicious is noticed, the boy is sent to a room for observation by the medical officer who visits these boys every morning.

667. That is an examination conducted by the medical officer?—Yes, of the Company.

668. Now, do not you think that, inasmuch as there is such a large proportion of these workers who contract pneumonia, it would be well if there were systematic State examinations periodically of all the workers in the mine?—I do not think it would be the least good. I believe these mine medical officers are thoroughly competent and they are heart and soul in the business of combating the disease

669. It is on the point of prevention that I am asking. Is it not possible that with the knowledge that, unless prevented, a very large number will contract the disease—is it not possible to do something to prevent it—that is, to arrest it before it has

gone too far?—Well, I think that everything that tends to the improvement of the mine underground tends to help us to combat the disease. That is what our mines are working for.

670. But the mortality still goes on?—Yes, we have not been successful yet, but we are fighting forward all the time.

671. Has progress been made during recent years in reducing the mortality?—No, sir; as far as I have been able to see, the increase in underground work has tended to increase pneumonia.

672. Although you do all possible to minimise the evil, it is apparently going on unchecked?—No, every suggestion that is helpful is tried.

673. With what result?—We have not been successful, but other means remain to be tried.

674. That is as to the future, but in the past, unfortunately, notwithstanding the fact that the Company has done, I am sure, all in its power, the mortality continues at this high rate at present?—Yes; but, for instance, now at Jagersfontein they are having their entire system of ventilation changed to a new system, which is being tried for the first time in South Africa, entailing enormous expense. They are putting in intermediate levels in their workings entirely for the sake of getting better ventilation.

675. Ventilation, I would suggest, must be an important factor in reducing mortality?—Yes, that is recognised as likely.

676. And developments are going on in that direction?—Yes.

677. Now we know that a very large proportion of those who die from diseases, as apart from accidents, die from pneumonia?—Yes.

678. That is the case as regards those of whose deaths records are kept?—Yes.

679. Does any considerable proportion of those who work in the mine go home and die there?—I do not think so; it is a strict regulation imposed by the Government and, I think, attended to by the Company, that no boy is allowed to leave the mine unless he is thoroughly fit to travel; otherwise he is kept for further treatment.

680. As bearing upon what you have told us about the attempt of the workers to avoid examination, is it possible to circulate information in their own language advising them of the danger of not taking precautions at an early stage?—Yes, it is quite possible, but I do not think they would pay any attention to it.

681. As regards coal mines, the area of coal in the Union is practically unlimited, so I won't ask you as to that, but can you tell us whether the system of mining is piece work or days' wages?—It is days' wages.

682. **(Sir Rider Haggard.)** Can you tell us how this high death-rate of these healthy young natives, who have all been medically examined, will compare with their normal death-rate between the same ages in their kraals?—I am afraid I cannot say that. I can tell you this, that in the last ten years I have seen the death-rate from disease down to 10 or 11 per 1,000 as against the present 21 per 1,000.

683. That is in diamond mines?—Yes, that is before we started underground work.

684. I mean they are a very healthy class of people outside in their own habitations?—The Basutos are a particularly strong and healthy class.

685. Therefore, it is the occupation that causes the death-rate undoubtedly?—Yes.

686. This pneumonia, I am told, is very often of an extraordinarily virulent and comparatively contagious type?—Yes.

687. I understand so virulent that the death-rate is often two-thirds of the cases?—Yes, that is explained, I think, largely by the boys escaping observation.

688. What is this inspection of which you have spoken? Do the boys simply walk past the medical officer as they go down to work?—No, they are examined carefully when they come in, but once they come in, I understand it depends on the compound officials picking them out if they show any signs of disease.

689. Are you talking of when they come in?—Afterwards.

690. Is there any daily examination by a medical man? You can understand that it would be impossible to have a daily examination. We have, for instance, 8,000 boys altogether at Jagersfontein alone, and the medical officer thinks he has done a very hard afternoon's work if he has examined one hundred boys.

691. I did not know if they walked past the doctor in the same way as passengers on a ship?—No, I think the compound officials inspect the boys.

692. And those compound officials may or may not, of course, have any elementary medical knowledge. I would suggest to you that a man suffering even from the very beginning of this disease ought not to be so difficult to detect by the skilled eye. Is there any sickness in the coal mines?—Yes, a great deal.

693. What kind is it?—Largely pneumonia, also.

694. These coal mines are not very deep?—No.

695. Do you think they get in the mines or outside by catching cold?—Mainly in the mine.

696. Do you happen to know if pneumonia is common in coal mines in other countries, for instance, England and so on?—I think not, comparing the figures in my mind. There is one thing I should like to explain. In the coal mines we get a particularly poor class of boy. We seem to get the rejected boys from the other mines in the north. These coal mines are not so popular as the diamond mines.

697. Have you any idea of the death-rate in the coal mines as distinct from the diamond mines?—It is rather higher, but pneumonia is not quite so prevalent in proportion to other diseases.

698. What diseases?—To a large extent, phthisis and kindred diseases, lung troubles.

699. When the natives go into these compounds are they allowed out or are they kept there until they depart?—What we refer to as the compound system covers anything inside the fence, which may represent miles and miles. At Jagersfontein the boys may have to walk a mile or more to go to work.

700. What is the right term for the place where the native lives?—Well, that is the compound. The compound system contemplates the whole mine area.

701. I am referring to a piece of ground about four or five acres with a high wall around and defended gates where these men live?—That is the compound.

702. Are those people ever allowed outside that place during their term of service?—They are never allowed outside the fence. They are allowed outside their living places because their work lies outside.

703. As far as I could see at Kimberley they go to their work through tunnels?—Those who work underground do, but 60 per cent. are employed on the surface and they can go anywhere.

704. They are never allowed to bring their families with them?—No.

705. They live in a state of celibacy during their period of service?—Yes.

706. **(Mr. Lorimer.)** I want to ask this one question. Does the fact that the boys at Jagersfontein have access to drink make any difference in their attendance in the mines?—No, they do not have access to drink. I believe that in Basutoland, and in the native territories generally, it is considered an advantage to come to a mine where the boys are not allowed to have drink; that is why so many like Jagersfontein, and it is exceedingly popular for that reason. A boy goes home with all his money.

707. Do they not get any drink at all?—No, none at all.

NATAL.

Durban, Monday, 23rd March, 1914.

Mr. Maurice Smethurst Evans, C.M.G., called and examined

(*For evidence of this witness on "Land Settlement and Irrigation" see p.* 36 *of* [Cd. 7706.])

708. **(Chairman.)** You have had a large experience of native labour. What is the cause of the apparently chronic deficiency of native labour in Johannesburg?—Well, I suppose that under our present system there is not enough to go round. Wherever native labour is used there is a tremendous wastage.

709. That is to say, native labour is used extravagantly?—Yes, this low-priced labour is used extravagantly, and, besides that, the native will only work for a short spell at once.

710. Are adequate attractions given to bring out the latent supplies of native labour?—They have recruiters all over the country, and they do their best to take the labour there; but my own opinion is that when they get them there they do not use the inducements they might to get the best out of them.

711. In what direction do you think they could get better work out of the native?—You will find the piecework system on the Rand is limited, in the case of natives, to a certain sum per day. They cannot earn as much by piecework as they might otherwise do. That is one direction in which they might be improved. There is an artificial limit of 2*s.* 3*d.*, I think it is, per day. If that labour was used to better advantage, I think they could do with fewer boys and the native labour would be more efficient. And in other ways it could be improved too.

712. **(Sir Jan Langerman.)** You say the native is limited in regard to his earning capacity?—Yes, on the Rand.

713. But is it not a fact that a native gets a certain amount if he puts in a 30-inch hole, and he can put in as many more inches as he likes, and he gets ½*d.* or 1*d.* an inch more?—I think, if you will make enquiries on that point, you will find that the practice varies on different mines, and that on some mines, if the native drills beyond 36 inches—if he drilled, say, five inches more—he would not get anything more for it. There is another point, and that is in regard to lashing and tramming and machine drilling. There the position is different. If the average boy's earnings on any mine exceed 2*s.* 3*d.* per boy, that mine is fined.

714. Fined by whom?—By the Transvaal Recruiting Association. They cannot give those boys more than an average of 2*s.* 3*d.*

715. **(Mr. Campbell.)** Does the dangerous and unhealthy character of the work on the mines at Johannesburg affect the supply of labour for the mines from this part of the country? Do the natives recognise that it is unhealthy to follow that occupation, and avoid it in consequence?—Well, they certainly regard it as unpleasant and are not fond of it; but I do not think the fact that it is unhealthy weighs very much with them. They have not recognised the seriousness of it, and investigations have not been very close among the natives. I do not think it has had any very serious effect so far, though it may, of course, prove to have such an effect in the future.

716. Other mines, like Kimberley, have no difficulty about black labour?—No, one reason being that they do not limit the boys' earnings. They can earn as much as they like at De Beers, and at the present moment the boys are paid according to what they earn. They can earn as much as 5*s.* or 6*s.* a day. On the Rand, on the other hand, they cannot earn more, on the two principal kinds of work that I have mentioned, than 2*s.* 3*d.* a day.

717. You think that has demonstrated that the offer of higher wages to the native workers attracts labour to the mines?—That is not offering a higher wage: it is allowing them to earn as much as they can.

718. Does it not mean the same thing? They can earn more at Kimberley and that attracts them more than Johannesburg?—Yes, the opportunity to earn more. But you broadened it more—you said the offering of higher wages will attract the natives more.

719. Yes, and you put it that the opportunity to earn higher wages attracts them to Kimberley rather than to Johannesburg?—Yes; there are circumstances, however, affecting higher wages that would not take a boy out. It would not have the same effect as on white men. Higher wages individually would certainly call out more boys, but not so many as in regard to white men, because the native has smaller wants. He argues that he has enough and, therefore, why should he work more?

720. And you put down the attractions of Kimberley to the opportunity to earn more money?—Yes.

721. **(Mr. Sinclair.)** Does separation from their homes and families keep supplies from Johannesburg?—Not more than in Kimberley. They are separated just as much there. Of course, they never like to leave home, but they have to. It is not that.

Mr. J. T. Williams, Managing Director of the Natal Navigation Collieries and Estate Co., Ltd., called and examined.

(*For evidence of this witness on "Railways, Harbours, and Bunker Coal," see p.* 125 *of* [Cd. 7706], *and for a statement furnished by him as to the Natal coal industry, see Appendix III p.* 148 *of* [Cd. 7706].)

722. **(Chairman.)** According to your memorandum* an adequate supply of native labour is necessary to increase the output of the Natal coal mines. What is the present position as regards native labour?—The actual labour consists of 545 whites, 3,773 Asiatics, and 7,376 natives. A few weeks ago the Native Labour Department wanted to know what was the number we would require to deal adequately with the coal industry. The replies received included all the Natal collieries and showed that we wanted 11,000 as against 10,000 at present, or in other words there was a shortage of about 4,000 natives or other coloured labour to deal with the normal output.

723. Do your native labourers stay on the mines for a longer period than at Johannesburg?—No, they observe very much the same custom in that respect. They usually contract for six months, rarely for longer periods. Sometimes natives will contract for twelve months, but we often accept them for four months.

724. Do they live in the compound or in their own huts?—Mostly in the compound, but we find it an advantage to build a number of huts on the mine so as to encourage the natives to settle on the property. One colliery that I am referring to has about 30 of these huts, and another colliery has about 20, and so on.

725. Do you get married natives to remain for longer periods than six months?—Yes, their stay is indefinite, but we have not very many.

726. But assuming that you had adequate housing accommodation for them would a large proportion of your staff remain on permanently?—Yes, but then the question of capital expenditure arises. The collieries cannot afford to provide separate quarters for all the men that work.

727. What is the cost of native huts?—I think some of our huts were built by contract for about 15*l.* each plus stores, or total about 30*l.* each.

* Appendix III; p. 196.

728. What amount of efficiency do you get from natives remaining on instead of changing every six or nine months?—I do not think I could state that in figures, but I would put it in this way. That if you have a native coming under contract for six months, for the first month or the first two months he is not of much use, his efficiency shows itself during the last three months of the period; so that whatever length of time he serves, for the first three months his efficiency is not very great, although it is increasing.

729. In the case of short contracts, do a large proportion of men who sign on consist of men who have been there before or are they largely fresh men?—Many of them have been at that colliery or another previously, but, of course, a large proportion are fresh men.

730. Cannot you state what the proportion of new engagements is to re-engagements?—I cannot state that off-hand.

731. **(Mr. Sinclair.)** You suggest that you require, for the full normal output of your present collieries, about double the number of natives you have now?—I think 50 per cent.

732. You say that for the full normal output the number required is over 14,000 and you have now some 7,000?—There are the Indians also to be added.

733. Asiatics (*i.e.*, Indians) are 3,773?—Yes, our total supply is now between 10,000 and 11,000, and the mines say they want 14,000, including Indians.

734. The mother country sends large coal supplies, does she not, to South America?—Nearly all the supplies of coal come from the United Kingdom.

735. Any portion of that trade which you might obtain by the fuller equipment of your mines in the way you suggest would come into competition, would it not, with the coal which is now sent from the mother country to South America?—Yes, practically.

736. That coal is mined by white labour at high wages?—Yes.

737. Is that the sort of development that you look for in the future if you can get a sufficient number of native workers?—We look for trade anywhere just as the United Kingdom looks for trade anywhere. They come into our market at Cape Town and they come into our market in other parts of the world.

738. They send their coal mined under the conditions that obtain in the mother country?—Yes.

739. **(Sir Alfred Bateman.)** How do you work your mines—with one shift or two?—With one shift.

740. Are the hours limited by law?—Yes. The shift is ten hours. For Indians it is nine hours with one hour off for meals.

741. How many more natives do you require to increase your output by 50 per cent?—About 4,000.

742. How much would that increase your output by?—That would increase it at least 4,000 tons a day—on the basis of a ton per man, and getting the maximum output from the existing boys.

743. **(Mr. Campbell.)** When you speak of the recruitment of native labour costing so much, what system of recruiting labour have you in mind?—In regard to the indentured Indians, that is all arranged by the Indian Immigration Board.

744. But labour within the Union?—All mines in Natal have their own recruiters. There is no organization acting for the industry collectively.

745. Is there no recruiting agency in existence now?—I am not sure whether there was not an agency formed the other day for a special purpose, but, as a matter of fact, there has not been an agency working for all the collieries.

746. Have you always been your own recruiters?—Yes, always.

747. Then the cost, of course, is simply made by yourselves. There is no one who is exacting any charge on the Company?—Yes, by ourselves, certainly. But the price is determined by what the recruiter can get from another colliery for doing the work.

748. It is just a matter of the necessary expense of the labour; you are not complaining about anybody outside the companies themselves?—There is no organization acting for more than one colliery, but we get our labour by recruiting agents working for individual mines—not a labour association—so the cost of labour depends on what we have to give these recruiters.

749. Is there an organized recruiting agency working throughout the Union for the purpose of supplying labour to the mines?—Yes, to the Rand Gold Mines. It is called the Witwatersrand Native Labour Association. They have recruiters right through the Union, and it is the competition of their labour which makes our costs so high. We have to pay recruiters practically the same rates as the Transvaal mines pay theirs, otherwise they get preference.

750. With the recruiting agencies at work, are their recruiting costs as great as yours, or less?—I think they are greater.

751. I suppose they have to get their labour from a greater distance?—Yes, and have highly paid men and a very widely spread organization.

752. And that is the reason you would give for the shortage in the supply of your labour—namely, the competition of the Transvaal gold mines?—Yes.

753. Do they pay higher wages?—Yes, not only to recruiters, but also to the boys themselves. They also have access to areas from which we are prohibited. For instance, the Transvaal can recruit in Natal for work on the mines in Johannesburg, and we cannot recruit in the Transvaal for work in Natal mines.

754. What is the reason for that restriction?—It is owing to the way the Native Regulations are carried out.

755. Is there any reason for those Regulations?—I suppose they want to preserve an adequate supply for the gold mines.

756. Who puts the Regulations into force?—The Native Labour Department put them into force, based upon their Act, which regulates recruiting for native labour. At present we are in constant communication with the Native Labour Department, and one of the suggestions we are making is that the Transvaal should not be allowed to come into Natal to recruit for the gold mines, and that Natal should be free to recruit solely in Natal themselves.

757. That is to say, let each Province of the Union depend on its own resources for its native labour supply?—Yes. I do not think they will agree to that, but I think it will be found that they will meet us to some extent by restricting the area within which recruiting for the Transvaal will be allowable. We know, for instance, that they stopped two districts on the north and south coast of Natal for recruiting from Natal for outside the districts, and those are now confined particularly in the interests of the sugar industry.

758. Would you have a sufficient supply of labour provided you were dependent on Natal alone?—If you include Zululand and Natal, I think we would. The figures show that to-day there are 16,000 natives from Natal and Zululand in the employ of the gold mines on the Rand. If those were available for Natal industries only, I think it would be found that we would have about enough. That would considerably help our local industries.

759. Is Basutoland drawn on for labour?—Mostly by the Transvaal.

760. There are no restrictions, so far as Natal is concerned, in regard to Basutoland?—No.

761. As between the imported Indian labour and the native labour, which is the more efficient?—Native labour, as a rule, is more useful for the mines, although, as far as efficiency goes, the indentured Indian is a very useful man. His physical strength is not to be compared with that of the native. For underground work the native is practically indispensable. Speaking of the collieries where the trucks are supposed to carry a certain quantity down below, the Indian cannot push them, although the native can do so quite easily. In other work, again, the Indian is the more useful. In regard to machine work, for instance, the Indian is more useful than the native because he is more adaptive and more intelligent.

762. **(Mr. Lorimer.)** How long does your coal stand in bin without firing?—It depends on the coal.

763. Some of it is very sulphurous?—A very small proportion.

764. Has it improved of recent years in that respect?—The percentage of sulphur coal is very much less than years ago.

765. Because I remember having a very curious experience, over thirty years ago, of the extraordinarily destructive effect on copper that it had, and people wrote about it, and I suggested that probably the coal was very sulphurous, and that it would be well to analyse it. It was analysed, with the result that there was a terrible percentage of sulphur. That was a new colliery, and probably the coal is better now?—Broadly speaking, about thirty years ago there were only one or two collieries in existence, and apparently an unfavourable report in regard to one colliery you are referring to kept back the whole industry for years, whereas later we found that the coal contained a much less percentage of sulphur.

766. Is there any of it that requires to be coked in order to make it useable?—There is no coke made in Natal to any extent—only a few hundred tons a month.

767. Then the coal must be better than it was before?—Yes.

768. **(Sir Alfred Bateman.)** Do you have a great deal of smalls lying at the pit?—Yes, the tonnage of smalls is very considerable, owing to there being no market for the dross or duff coal, as it is called. All coal sold is of the size of peas, nuts, or large coal. There are only one or two customers who use dross coal, notably the Durban Corporation.

769. There is no way of utilizing it?—No, not at present.

Pietermaritzburg, Friday, 27th March, 1914.

Mr. David Forbes Forsyth, B.A., Chairman, and Mr. Robert Dunlop, Secretary, of the Pietermaritzburg Chamber of Commerce, called and examined.

(*For the evidence of these witnesses on "General Trade Questions," see p. 171 of this Vol., and on "Steamship and Cable Communications," see p. 80 of* [Cd. 7706].)

The following Memorandum was handed in by the witnesses:—

Iron.—The most important of all latent industries is that of the development of the iron ores that exist in the vicinity of Maritzburg. There are three kinds of ore to be found in the district, viz.:—

(1) Very pure hydrated sesquioxide, the analysis of which is as follows:—

Iron	62·0	per cent.
Silica	2·75	,,
Lime, &c. ...	trace	

This ore is found at an elevation of 3,500 feet. As in Spain, the Forest of Dean, and elsewhere, this ore is patchy, the ore bed being fairly continuous, but varying in thickness from 4 feet to 1 foot. Outcrops can be traced for about 30 miles.

(2) Manganiferous Hæmatite, the analysis of which is as follows:—

Iron	50·0	per cent.
Manganic Oxide	2·36	,,
Phosphorus ...	0·30	,,
Silica	6·08	,,

This is found at an elevation of 2,250 feet, in the lower carboniferous formation, ecca shales. There are a number of veins varying from 6 feet to 1 foot in thickness. Millions of tons of this ore could be got easily and cheaply.

(3) Brown Hæmatite, the analysis of which is as follows:—

Iron	35·0	per cent.
Silica	30·5	,,
Alumina ...	10·30	,,
Phosphorus ...	0·14	,,

This ore is derived from the decomposition of the beds of manganiferous hæmatite, the shales having been washed away, the broken ore has collected on the flats, and has been cemented together again by the product of its own decomposition. There are very large quantities of this ore. The average cost of ore at furnace would be under 5*s.* per ton. Experimental work has been carried out in smelting ores with a blast furnace. The coke used was prepared from Natal coal, and coke is now being produced of excellent quality and fit for the best foundry work, the percentage of ash and sulphur being, ash 9·20 per cent., sulphur 0·90 per cent. The lime used for flux has been obtained in the Province of Natal, but owing to its distance from the iron and coal beds it has been rather expensive. Abundant supplies of excellent lime exist in this Province, but are situated a considerable distance from a railway line. The materials for furnace use, such as fire clay, ganister, &c., exist in large quantities in this neighbourhood, and a small company has successfully experimented with local ores, mixing them together and producing a good foundry iron, which drills and files easily. As the blast furnace for this experiment was working by day only, the iron only lightly carburetted. Careful calculations show that the iron can be produced at a cost which would enable it to be sold as pig-iron at a price under that of the imported article. The establishment of a foundry for the production of castings, which are now imported at a cost out of all proportion to that at which they are invoiced by the manufacturer, should be a very profitable business, when one takes into account the bulk and consequent heavy freight, and liability to breakage in transit of imported castings; such articles as water pipes, plain iron columns, telegraph and telephone poles, &c., can be made here at a price considerably lower than those articles can be imported for. It will be necessary, however, in order to establish such an industry, to employ skilled workmen from England or Scotland. The potentialities of a base metal industry like iron are immense, and it is hoped that the wealth of this industry will soon be developed.

770. **(Mr. Lorimer.)** I am rather interested in what you say about your iron ores. I hope to see one of these fields to-morrow, but some of them, from what you say, look well and some of them are not so valuable. The analysis is not so complete as I should like to see. Can I get a complete analysis of these ores anywhere?—**(Mr. Dunlop.)** I can give you an analysis obtained from the Imperial Institute, London. I have also some samples here.

771. Has the Imperial Institute had samples sent to it?—Yes, samples of the second ore, and the first analysis is by Messrs. Brown and Company of Leeds.

772. You have given me three, one has a very good percentage of metallic iron, that is the first one. But the analysis practically stops at that. You give silica $2\frac{3}{4}$ per cent., but no more, and in the next one there is also a good percentage of iron and the phosphorous is quite moderate and the silica. But I want to know a little more about it. In respect of the third sample, the percentage of the metallic iron is very, very small, but the percentage of silica is enormous, so we cannot make much use of that, but the other two I should like to see a fuller analysis of. Can you get me that?—We will try to-morrow.

773. To whom do these outcrops belong. Are they the property of the nation?—No, they are mostly held by private individuals.

774. And have you any idea whether these people would allow these outcrops to be worked?—They would be very pleased, indeed, in most cases, I think, to have the deposits worked on a royalty basis.

775. Because in Durban the other day we had a proposition of this sort made to us and it was withdrawn on the ground that the owner preferred to farm his land rather than allow it to be worked as an iron mine. That would not be the case here, you think?—No. We have already very considerable areas under option. At the present time the attention of some London financiers has been directed to these iron fields, and cable negotiations are going on this week in regard to them.

776. Have you any foundry in the Union at all?—Yes, we have several, especially on the Rand.

777. But none in town here?—We have foundries in Durban. There is a foundry in connection with the railway works, and a very good one it is.

778. But, for general customers, is there or is there not a foundry?—There are several small foundries for general work.

779. Have they to import all their pig iron?—Yes. All the pig iron they use is imported and so is the coke, or it was until just recently. The Government themselves are the biggest sinners in that connection.

780. Do you not make coke from Natal coal?—Yes, we do.

781. Would they not buy that for foundry purposes?—They buy very little; I presume it is because of the larger percentage of ash in South African coal in comparison with imported coal.

782. I had some experience myself many years ago in regard to Natal coal, which was disastrous to use on account of the sulphur it contained.—That may be.

783. Now, is the coal coked in ovens or in the open?—In ovens, and these have been very much perfected recently with the object of getting rid of the sulphur.

784. And is this sulphur practically eliminated?—The figure now is 0·90. As you may be aware anything under 1 per cent. is admitted by iron founders to be a negligible quantity.

785. What can you sell it at?—Natal No. 1 foundry coke is sold in Johannesburg at 4*l.* 15*s.* a ton.

786. What would you sell it at in Durban?—The price would very greatly depend on the purpose for which it was wanted.

787. You know you can get first rate coke at home for 25*s.* a ton?—Yes, it is 24*s.* 9*d.* f.o.b. Sunderland.

788. And what is the freight?—The freight is 37*s.* 6*d.*, I think.

789. That is 3*l.* 2*s.* 6*d.* and you want 4*l.* 15*s.*?—It is a very bulky freight, it is a measurement freight, it is not avoirdupois. All the coke imported here, or most of it, comes out in tramps or wooden bottoms.

790. At what price could you afford to put it on trucks here for foundry purposes?—About 45*s.* or 42*s.* 6*d.*

791. What makes it so dear when your coal is only 10*s.*?—In the first place Natal coal is very much dirtier than Welsh coal or Durham coal. We usually have to have at least three or four washings. The result of that is that to make a ton of coke you require to use over 1½ tons of coal, and then the difficulty in the coal fields has been to obtain an adequate water supply. The best coke made in the Colony to-day is made near this city, and the coal is actually carried down from the pits and a carriage of 7*s.* 9*d.* a ton is paid on it. Half a ton of every ton of that coal is wasted in washing, and yet the coke is returned and sold in Johannesburg and competes with imported Durham coke, which, I may say, goes to Johannesburg via Delagoa Bay, and is sold in Johannesburg at 7*l.* 15*s.* per ton for No. 1.

792. And what is the comparative value of yours and theirs. I won't encourage you to say it is just as good, because I suppose it is not?—Well, I am not going to say it is any worse, but for all foundry purposes it serves the same purpose as the imported coal, but one can conceive that there may be cases where it would not be quite so suitable.

793. What do they use it for?—They use it for amalgamating and smelting and all ordinary foundry purposes.

794. They do all their smelting with coke? Yes, mostly.

795. It looks as if you should be able to develop your business with the imported coke at 7*l.* 15*s.*, and if you have something equally good you can deliver at 4*l.* 15*s.* you have a considerable margin to work upon and you do not want any help from us from that point of view?—No, except in connection with the flux for the iron smelting. We have had considerable difficulty in getting a suitable flux. We have Natal lime, but, as I have pointed out in the report, it is a very considerable distance from the railway, and the Government has not looked on it with favour sufficient to extend a branch line in that direction.

796. Is there no railway to-day?—No, the lime we are using at present, and a sample of which I will show you, is brought from Port Shepstone, on the south coast of Natal, and thence to Maritzburg by rail.

797. What does the freight cost? What would it cost to bring it from the mine here?—I think about 8*s.*

798. I suppose you have made a good many researches to see if you can find something nearer to hand?—Yes, we have found some very good lime in Umvoti county, but we cannot get the railway to it. There are some valuable deposits there which have not been developed.

799. Then you have all the elements for successful working of this iron ore within your reach?—Yes.

800. **(Sir Rider Haggard.)** About this coke—would it not be possible to establish coking works close to the mines? Would there be any possibility of reducing the enormous cost of this manufactured coke?—Is it enormous—I am not so sure of that.

801. Well, it is enormous compared with English prices?—But it must be remembered that in England this coke is produced by recovery plants. It is returned to the colliery as a free gift. The coke is handed back to the colliery people in recognition of the fact that the man who makes the coke obtains the by-products, such as tar, benzol, and other things. In this country we have not got recovery plants at present. There is a company called Ammonium, Limited; this company has just been formed in London with a capital of 325,000*l.*, and I understand that Messrs. Brunner Mond and Company are connected with it. It is for the purpose of establishing by-product plants on the Vryheid coal fields, where they are going to produce sulphate of ammonia. Whether all the coke which they make will be marketable or not I do not know, but I do not think it will be marketable as foundry coke.

802. As I had the opportunity of seeing the other day, you can put out the coal at anything from 7*s.* to 5*s.* per ton?—Yes.

803. And the difference between that and the price of 4*l.* 15*s.* is very considerable?—It is delivered in Durban at about 47*s.* 6*d.*

804. But the difference between 47*s.* 6*d.* and the figure I mentioned just now is very great? Yes, the distribution costs at Johannesburg are very high.

805. You talked of the waste through washing, but even supposing there was waste through washing, the initial price of the coal is very small?—You are referring to the coal fields, not to the coke manufactured near here.

806. No, I am referring to it being done on the most economical scale and at the most economical place?—I admit it is a foolish thing to try to defend the practice of bringing coal down here and sending it back as coke, but there are extenuating circumstances in favour of continuing that course. The coking business in this neighbourhood was started with the primary object not of making coke for general purposes, but of making a coke suitable for using with local ores for smelting purposes at the present works.

807. I am only asking this question because it seems to me that, as coke enters largely into the necessary preparation of iron and so forth, it does not look as if you had much prospect for the iron industry unless you can bring down the price of coke.

808. **(Sir Alfred Bateman.)** You have had a report from the Imperial Institute, you say. Was that in connection with the work done for the Iron Trade Association some years ago, where ores were obtained

and sent home for report? Did you have anything to do with that?—No, I was not interested in that, but I have some samples of ores here, which are referred to in my statement, if anybody wishes to see them.

809. I think you said that only one was reported on?—The first ore is reported on by Messrs. Brown's Armour Plate Company, of Leeds; No. 2 by the Imperial Institute; and No. 3 by the Government Analyst in Natal, Mr. Neville.

810. The third one has not been sent home?—No. Not by me, at all events. These ores have all been reported on favourably years ago by Mr. North. You will find these reports confirmed by him, and you will find Dr. Hatch's report on the mineral resources of Natal. He gives the first sample a higher percentage of iron even than the Imperial Institute.

811. You know that the Imperial Institute do this work free of charge for the Colonies? I was not aware of it.

812. It would be your best plan to obtain reports from the Imperial Institute on any similar ore which you may have. They will be pleased to make reports of this kind at any time?—Thank you.

813. **(Mr. Garnett.)** Could you tell us what the production of South African coke is?—I am afraid not, at the moment, but I could give you the figures this afternoon.

814. Because, if Durham coke is sold at 7*l.* 15*s.* and has to be imported at that figure and you can put coke in Johannesburg at 4*l.* 15*s.*, it would seem that there must be a considerable field for the extension of this business, always assuming that price for price your South African coke is capable of producing as good results?—Yes; I did not say that.

815. No, you were careful to say that you were not in a position to state whether your South African coke could be used equally advantageously as the Durham coke. I find that 29,131 tons were imported, of which 29,000 tons came from the United Kingdom—50 tons from Belgium and 42 tons from Germany. You cannot tell us what your production is?—The production in Natal for last year was between 7,000 tons and 8,000 tons. Our coke is not being used for purposes yet that imported coke is being used for.

816. Are you confident that you have the class of coal that can make coke equal to the Durham coke?—I am confident that we have the coal in Natal, if it is properly handled, and we are hopeful that with the interest now being taken in the matter of by-products and with the highly technical men coming out to work these bye-product plants a great advance will be made in this direction, and, later on, we will be able to stop the importations.

817. You are losing all the residuals at present?—Yes.

818. **(Sir Alfred Bateman.)** In regard to this coke is there much extension of gas-making?—There is no gas-making that I know of. I think there is only one town in South Africa where they have a gas-producing plant, and that is Port Elizabeth. I do not know of any other.

819. They have never tried to do it in connection with this coke question?—No.

820. **(Mr. Lorimer.)** Suppose we found that there were very large quantities of high-class iron ore throughout the Union—far more than you can utilise yourselves for a very long time; would your Chamber want to keep it to themselves, or would you approve of exporting it as ore? We have gone into the question of the possibility of Natal ore competing with Spanish ore at Middlesbrough, but, as you know, 50 per cent. Spanish ore to-day at Middlesbrough is fetching from 21*s.* 6*d.* to 22*s.* 6*d.* We could not land Natal ores with the present freight of 12*s.* 6*d.* in Middlesbrough for 22*s.* 6*d.*

821. I quite realise that there are plenty of places where you want railways in order to take the ore to the ports.—Yes.

822. No doubt the Government might entertain favourably the possibility of building a railway if they saw a large traffic ahead of them. Then, of course, in addition to that, there is the question of sea freight, and that, while it would vary from time to time, would add considerably to the cost, and so the whole thing would depend on the quality of the ore. Your inferior ores it would be impossible to export. The high-class ores you might?—Yes.

823. They are becoming scarce, and as they become scarce they rise in value, so that you could look to get better prices for your high-class ores now or in a few years hence than, say, twenty years ago?—Yes.

824. But you are prepared to entertain the idea of shipping?—Yes, if the ores are not going to be smelted here. But if we are going to smelt here, we do not want to export all our high-class ore, because we are mixing our ores in three equal parts.

Mr. John Thomas Audas, Head of the Administrative Branch of the Mines Department, Natal, and Mr. F. A. Steart, Inspector of Mines, called and examined.

825. **(Sir Alfred Bateman.)** You hold an office in the Administrative Department, Mr. Audas?—Yes, I am the Head of the Administrative Branch in Natal.

826. And you, Mr. Steart?—I am Inspector of Mines, stationed at Dundee, in the coal district.

827. What you propose to give, I understand, is evidence entirely about the mining industry in Natal. Could you give us a short account?—The mining in Natal is principally confined to coal. The other mining has not yet been established on a sound basis, and it is mainly in the prospecting stage. We have a gold output, but it is very small. In regard to the coal, the information I have deals with the coal output from 1889-1913. In 1889 the output was 25,609 long tons, and the value 12,805*l.* The output increased annually up to the time of the war, when it reached 387,811 tons.

828. Is that for 1898?—Yes. The value then was 175,015*l.* During the war, of course, the output decreased. It went down to 241,330 tons.

829. We have had from the Coal Owners' Association in Durban a good many figures as to the extent of the industry, the numbers employed, and that sort of thing?—I was giving a statement just to show the wonderful advance that has been made since the war. The tonnage in 1898 was 241,330. Now, at the end of 1913, it has reached an output of 2,588,148 tons, valued at 868,185*l.*

830. What does that work out at per ton?—About 6*s.*

831. What is the present selling price?—The contract for coal for 1913-14 is—for export, 14*s.*, 15*s.*, and 15*s.* 6*d.*, according to the quality of the coal supplied. Of course, it should be noted that coal in Natal varies very much in quality.

832. But this has got the railway charges on it as well?—Yes, everything. That is delivered on the ship at Durban.

833. But the railway charge is about 5*s.*, is it not? You have nothing to do with those charges for shipment or railage, have you?—Well, we could give them.

834. We have had them already from the Coal Owners' Association and we won't repeat them, unless you have some special views you would like to give the Commission?—No, I do not think we have any special views on that point.

835. Then you do not enter into that question about the competition between the Transvaal and Natal coal at Cape Town?—Of course, we have our private views about that, but I do not think that we as officials should give those.

836. In regard to the conditions of the industry, you must have some valuable information on that, have you not?—The conditions of the industry greatly improved up to the date of the coal strike at the end of 1913. The conditions of coal-mining at that time had reached a position higher than they had ever reached before. That is to say, the selling price of the coal had risen to what was considered a very satisfactory figure, and the demand for the coal was actually greater than the output.

837. How was that?—The whole of the coal up to the time of the strike was sold, and I believe that the present glut is only temporary, and is due to the boats which took regular supplies from Natal going elsewhere on account of the strike.

838. Then, you think there is every chance of the demand for Natal coal increasing?—I think so.

839. Do you think there is likely to be an increase for internal use?—**(Mr. Steart.)** Yes, a small increase, I think.

840. If you get these manufactories either at Durban or here you will want coal?—Yes, I think so. **(Mr. Audas.)** We were depending on local consumption practically ten to fifteen years ago. It is only of recent years that we have had this big shipping trade.

841. You have now a big shipping and bunkering trade?—Yes, and export, of course.

842. Do you consider that Natal coal is of good quality?—We have had it tested, and our tests showed the coal to be equal in many respects to Welsh coal. Of course, it is not so clean.

843. It is very dirty?—Some of it, but, of course, we take great pains in washing it.

844. Then, what other information is there that you think would be useful to us?—It might be of interest to know the conditions under which coal can be acquired and the royalties paid on coal properties.

845. Yes, I do not think we have had that information very satisfactorily given as yet; could you just give us a short statement?—Previous to Union, all minerals mined in Natal had to pay a royalty of 1½ per cent. to the Government on the value of the output. When Union took place, the Profits Tax Act was passed, and this meant the payment of a percentage of the profits. It is on a sliding-scale basis, and varies according to the profits earned. I think if a colliery or mine pays less than 5 per cent. they do not have to pay Profits Tax, and after 5 per cent. dividend they pay a Profits Tax varying from 2½ per cent. up to 20 per cent., or whatever the earnings of the mine in dividends are.* Title to the coal is acquired here by the taking out of what is known as mineral claims. These mineral claims are approximately of 100 acres.

846. Can anybody take out a claim?—Yes, anybody can take out a claim. The claim is acquired by a person applying for a licence, and then he pegs off his claim. He first of all takes out a prospecting claim, which costs him 4*s.* a year for his licence, for 100 acres, and after it is prospected he has to convert into a mining claim before he can extract minerals for sale. The mining claim licence costs 2*l.* per month.

847. Is that for all minerals?—No, that is for coal. For other minerals the area is 18·595 acres taken out on the same basis.

848. That is including iron ore?—Yes. Of course, all minerals are reserved to the Crown, but in some cases the Government has not got the right to the coal. Some old titles were issued in which coal was not reserved, and in these cases the owner of the farm owns the coal. But coal can be taken up on private lands by the procedure I have just explained. Of course, everybody cannot get a licence for private lands. The circumstances would be taken into consideration, and the Minister has the right to refuse a licence or grant it as the case may appear to warrant.

849. If a licence is taken up on private lands, there are three parties to the profits, I suppose, the State, the original owner of the land, and the licensee?—Yes, quite so.

850. Could you give us any idea what proportions are allowed to each of those three parties?—The licence fees that are paid to the Government, and the profit tax collected from the mine, are divided with the land owner and the Government. Of course, the miner gets the remainder.

851. If a man has got a good farm, or good land, would it pay him as a rule to have his land used for coal?—It would, of course, all depend on the value of the coal and the value of the particular farm.

852. Well, it means interfering with his own use of it?—In coal-mining, of course, they do not break up the surface very much, but the establishment of a colliery on a farm interferes considerably with the use of that farm, owing to the number of labourers crossing the surface. But he has compensation. I might say that the major part of the coal is mined on land which the Imperial Government had reserved in the early days as far as the sole rights to coal were concerned, and the land was sold with this reservation, and the owner when taking up that land knew he had no right to the coal, but for many years the law was not put into force—in fact it was not put into force up to the time of Union. When the Union Government put this law into force, many farmers had utilised their land as though they had the full rights to coal and had leased the coal, but, of course, when that law came into force they had to come under it, and they are now only entitled to the dues that are payable under the law. I might say, in this connection, that all the old leases, as far as I know, entered into between coal miners and private owners are still in existence. The coal miners have not disputed their liabilities under these leases, and they still continue. Many persons make it a practice at the present time to enter into leases with farmers with the object of acquiring large areas. The reason for that is that only a limited number of licences—that is, four licences—can be issued to any one person for a farm, and if a farm is of 2,000 acres, only 100 acres can be granted to an outsider, and the owner has the right then to select the remainder, or to peg it out if he likes.

853. If he had half a dozen children, could he put them in?—He has no need to if it is his own land.

---

* The witness subsequently furnished the following extract from the Mining Taxation Act of the Union, No. 6 of 1910:—

MINING TAXATION ACT.

Taxation on Profits of Mining.

3. There shall be levied annually a tax:—

(*a*) On the profits of mining for diamonds, 10 per cent.;
(*b*) On the profits of mining for gold, 10 per cent.;
(*c*) On the profits of mining for other minerals, according to the following scale, that is to say—

Scale.	*Rate of tax.*
If the amount of profit do not exceed 5 per cent. of the gross revenue derived.	2½ per cent. of the profits.
If the amount of profit exceed 5 per cent., but do not exceed 10 per cent. of the gross revenue derived.	3 per cent. of the profits.
If the amount of profit exceed 10 per cent., but do not exceed 15 per cent. of the gross revenue derived.	3½ per cent. of the profits.
If the amount of profit exceed 15 per cent., but do not exceed 20 per cent. of the gross revenue derived.	4 per cent. of the profits.
If the amount of profit exceed 20 per cent., but do not exceed 30 per cent. of the gross revenue derived.	5 per cent. of the profits.
If the amount of profit exceed 30 per cent., but do not exceed 40 per cent. of the gross revenue derived.	6 per cent. of the profits.

and thereafter for every additional 1 per cent. of profit an addition of one-tenth per cent. to the rate of the tax.

854. But if it is other people's land?—It is according to whether they fulfil the requirements of the law. They would require to be over 16 years of age.*

855. Now, are the figures about the coal production, values and so on, official?—The figures I have given are official.

856. We had figures given by the Coal Owners Association?—I think those were supplied from the Department.

857. You think they are reliable?—I do not know so much about mine—I only had a very short time to get them out.

858. Does each coal owner make a return to you?—They do make returns. The returns up to the time of Union were made to the local department, but the whole administration of mining is now under Union, and a department in Johannesburg under the Government Mining Engineer deals with returns and statistics.

859. We shall get all those statistics for Natal up there?—Yes, quite so.

860. **(Sir Alfred Bateman, to Mr. Steart.)** You have some information, I think, about the extent of the seams, the formation, and so on?—**(Mr. Steart.)** Yes.

861. What is your general thesis?—If this is any use to the Commission, I have here a statement that was got out for the Geological Congress in Canada last year, showing the areas of the various coalfields in Natal and Zululand, and the approximate tonnage. I do not know if it would be of value.

862. We shall be very pleased if you will put it in?—I will put in a copy of it.†

863. Could you shortly describe the general geology of the coalfields in Natal?—Well, personally, I am acquainted more particularly with the Klip River coalfield—that is from Dundee upwards, which is the principal one, and I can give you the approximate extent of that coalfield. I have roughly marked it on the map and this may interest the Commission. It extends from a little south of Elands Laagte to Charlestown—a distance of about 70 miles.

864. And how much in width?—It is nowhere more than about twenty miles wide at the widest part.

865. Is that the principal one in Natal?—Yes, of course, that is not all good coal. It is very much intersected. It depends a good deal on the general elevation of the country, and a good deal of the area I have mentioned is below the coal horizon and contains no coal at all, and further much of it is overlaid with igneous sheets, and intersected by dykes, and is, therefore, useless on that account. The coal does not extend on the west of the main line anywhere more than ten miles from the railway.

866. Have you to do with any other minerals besides coal in this Province?—No, nothing except coal since I have been in Natal.

867. Where shall we obtain particulars of the iron ores worked?—There are none being worked that I know of.

868. Not in small quantities?—Not in my district. **(Mr. Audas.)** I could prepare a statement in reference to the iron ores and deposits. There is nothing in the way of iron developed in this Province at the present time. There are a number of known iron deposits; none of them have been developed to give any reliable information concerning their values. I suppose the furthest development that has taken place in the matter of iron is a small works outside Maritzburg where they have actually smelted and produced pig iron, and that iron has been reported on to be of excellent quality, but the extent and size of the lodes have not yet been demonstrated.

869. So it is hardly a commercial proposition yet?—No, there is not sufficient known about it, I think.

870. Are there any other minerals in Natal that are worked?—I will put in a short statement* giving the output of the various minerals covering the past three years. The gold output in Natal is small, although we have a very large area of land held for gold-mining in the country. The prospects in many cases are said to be good, but we have had very little real development in the gold industry in this Province yet.

871. **(Mr. Sinclair.)** Does this large area of which you speak comprise the bulk of the coal measures of Natal?—**(Mr. Steart.)** Yes, I think so.

872. How many collieries are being worked in that area?—At the present time, I believe there are 22 being worked.

873. All worked, I take it, by the same class of labour? The class of labour is common to all?—Yes.

874. Does this large number result in combination or competition as to price?—I suppose it does to some extent result in competition.

875. Are the prices approximately the same?—Yes, I think so.

876. Are those prices arrived at by united action on the part of those who are working mines?—Generally speaking, I think so.

877. That is to say, the price is really brought about by combination?—Yes, generally speaking. But there are some mines outside of it, I think. **(Mr. Audas.)** I have a little information about that. The coal owners formed a body known as the Coal Owners Association, which is a combination formed for the purpose of regulating the selling price of coal. It was formed about three years ago, and it is really an annual agreement. That is to say, the members meet each year and decide whether they will continue or not. I might say in this connection that since the formation of the present Coal Owners Association, they have raised the price of coal from 1*s.* 6*d.* to 2*s.* 6*d.* per ton. Of course, the price varies with the quality of the coal. Previous to that, of course, the collieries were competing independently in the market, and a number of collieries which were not producing very good coal had a difficulty in selling their output at all. But the Coal Owners Association have done away with that, and they have made the price of coal more regular, and the sale of the coal up to the time of the strike was very satisfactory, and, in fact, all the collieries were selling their output without difficulty.

878. The rise has been about one shilling a ton?—From the time that the Coal Owners Association was formed the price has improved from 1*s.* to 2*s.* per ton. I have some figures here where contracts were made in 1913 at 13*s.* 3*d.*, and the same coal is now sold at 15*s.*—so there is a rise of 1*s.* 9*d.* in the past year.

---

* The witness subsequently furnished the following statement with regard to mining claims in Natal:—

Mining in Natal is administrated under Act No. 43 1899, and subject to the provisions of this Act the right to mine for and dispose of all minerals on lands situated within this Province is vested in the Crown

The title to mine is granted in the form of claims, which vary in size according to the mineral or metal required to mine. An Alluvial Claim is 100 feet by 100 feet, a Metal Claim 300 yards by 300 yards, and a Mineral Claim 700 yards by 700 yards. An Alluvial Claim is granted for the purpose of mining for alluvial or precious stones. A Metal Claim is granted for the mining of all minerals excluding alluvial and precious stones. A Mineral Claim is granted for the purpose of mining for coal, limestone, stratified ironstone, slate, soapstone, oilshale, and phosphates.

These claims are acquired by first obtaining Prospecting Claim Licences, costing 1*s.* per licence for three months, and can be obtained from any Magistrate's office, for all lands except private lands, the licences for private lands being obtainable only from the Office of the Commissioner of Mines.

An applicant for licences cannot take out more than four licences for each class of land in his own name, and such applicant must be a European over the age of 16 years. After the issue of the licences, claims can be pegged and registration applied for, the Registration fee for Prospecting Claims being 5*s.* per claim.

If each claim is worked by a European, only the Licence fee 1*s.* per claim per quarter is required to be paid during the prospecting stage, which may continue for any period up to the time outputting commences. When outputting commences the Prospecting Claim must be converted into a Mining Claim, which must be surveyed and registered. The Mining Claim Licence costs £2 per month for Alluvial and Mineral Claims, and £1 per month for Metal Claims.

If claims are required on private lands, the landowner is notified when the application for licences is made, and has the right to lodge any objections to the issue of such licences. These objections are considered and the licences issued or refused according to the circumstances. Only four licences in the first instance, can be granted to outsiders over private lands, but three months after the issue of these licences, the issue of licences to outsiders can be resumed. During this period of three months the owner has the right to take out as many claims over his property as he desires.

Mining on private lands is not permitted to interfere with any homestead, orchards, plantations, water-furrows, or cultivated lands unless compensation is paid.

The owner of private lands receives from the Government half licence fees and royalties received in connection with claims on such owner's land. All titles to land issued in Natal since 1870 contain a full reservation of minerals to Government.

† The witness put in a statement showing the estimated coal resources of Natal and Zululand to amount to 7,931 million tons.

* Not printed.

879. Have wages gone up in this interval?—Of course, the coal is mined here mostly by Asiatics and natives, and only supervised by white labour.

880. Has the cost of labour gone up proportionately to the increase in the price of coal, or is the increase in the price of coal simply the result of combination?—Well, I do not know of any increase in the price of native or Asiatic labour. I do not think the price of that has been increased, but, of course, the strike of the miners recently was due to the fact that they were not satisfied with their rate of wages. I believe the average wage was about 15*s.* a shift prior to the strike, and the men struck for 1*l.* a shift. The Coal Owners Association offered seventeen shillings, and some of the men returned to work at that rate and the others who did not return at the time are now working at the old figure, so there has been really no great advance in the rate of wages.

881. What is the length of shift?—Ten hours.

882. Worked at the face?—**(Mr. Steart.)** No, it is ten hours underground.

883. And how long does that mean working at the face?—As far as the natives are concerned they come up when their task is finished. Some of them might finish in five or six hours, but the white miners have to work ten hours from bank to bank. They do not do any actual face working. They only supervise the natives. They do little manual work.

884. What is the average cost of coal at the pit head?—I think it is about 6*s.* 6*d.* at the present date.

885. That is for the best coal, is it?—That would be the average.

886. Are any of the mines in this locality troubled with soft coal?—No, the coal is not very soft in any of the collieries that I know of.

887. They are not troubled with seams of soft coal?—No, the coal is fairly uniform. We have only two seams in the Klip River coalfield, and we have fairly good roofs generally.

888. Are there many faults?—No, there are some very big ones, but not many. But there are innumerable dykes.

889. Is heavy timbering required?—No; frequent timbering, but not heavy, is required in most of the collieries.

890. I gather that the gum is used for timbering?—Yes, but they use more wattle in the Dundee district.

891. Is it cheaper?—Yes, I believe so.

892. Are there large areas, do you think, untapped? Well, the area of the coalfield, Dr. Hatch says, is enormous, but the area of coal of good quality is, to my mind, limited.

893. In regard to the area of coal outside this limited area that you speak of, is it faulty, or inferior coal?—Much of the coal is spoilt by the intrusion of igneous sheets.

894. Would it not be workable at a profit?—No, the calorific value is very low.

895. It is all a true coal, I take it—it is not a lignite?—No, it is true coal. I can give you the analyses, if you wish.

896. You might hand it in.* Are there coke ovens at any of the collieries?—At two only that I know of.

* The witness handed in the following statement:—

Analysis.	S. end of Coalfield.	Middle portion of Coalfield.		N. end of Coalfield
	Elandslaagte, Pit No. 2.	Natal Navigation.	Durban Navigation.	Newcastle.
	Per cent.	Per cent.	Per cent.	Per cent.
GENERAL—				
Moisture	1·00	1·16	1·50	2·60
Volatile Hydrocarbons	22·54	19·90	29·06	28·96
Fixed Carbon	56·90	67·82	57·63	56·10
Sulphur	1·60	1·58	1·20	1·23
Ash	18·50	10·08	11·02	11·52
INORGANIC CONSTITUENTS—				
Carbon	65·91	78·12	69·16	65·26
Hydrogen	4·05	5·20	4·56	3·72
Nitrogen and Oxygen	8·94	6·60	12·56	15·67
SPECIFIC GRAVITY ..	1·427	1·342	1·363	1·388
Calorific power (lbs. of water evaporated per lb. of coal), as estimated by Thompson's Calorimeter.	13·32	13·80	14·46	14·31

897. Is coke extensively manufactured?—At one colliery they have 12 ovens at work and 12 at another. The average coke output is 150 tons per month.

898. Are there bins at any of the mines for storage?—Yes, I think all the collieries, with one or two exceptions, have bins.

899. In regard to coal that is supplied to the Admiralty, is it a condition of the contract that there shall be storage bins?—No. I do not think they supply any coal to the Admiralty. I am not aware of it.

900. You told us that by the strike some mines lost trade?—Yes.

901. Can you tell us whether that trade has been recovered?—The time is not sufficiently long to be able to say whether it is recovered yet, but I do not think it is up to the present.

902. **(Mr. Tatlow.)** On the whole the prospects of the Natal collieries are good?—Yes, for some few years to come, I think.

903. Have you any estimate formed as to how long a life the coal measures have here—how long the mines will hold out at the prospective rate of production?—That would be very difficult to say. It may be that some of the coals now considered useless may be used in the future for gas engines and so on.

904. But there is everything favourable at present to the business. You have a good market and a good demand for the coal?—Yes.

905. A good supply of labour?—I am not so sure of that. I think that is the great difficulty.

906. You gave the figure of the output at 2½ million tons?—Yes.

907. Has that been increasing year by year, and does it still show an increasing tendency?—Yes, the Natal output has never had a set-back except during the war. It has steadily increased, and I think it will continue to do so.

908. You have great advantages in regard to coal for bunkering, and can deliver the coal at a very moderate price. If you largely increase your trade can you find labour readily?—No, not readily, I think. I think that is the greatest obstacle to the rapid extension.

909. Given that labour you could very largely increase the business?—Yes.

910. Is there any drawback concerning the business at all—any deterrent to its expansion?—The great deterrent during the last two or three years has been the truck supply.

911. That is the question I was leading up to. Is the business of the colliery retarded at times from this cause?—Yes, very considerably.

912. You know how the trucks are kept under load at the port?—I have heard of it. I do not know the reason for the shortage, but I know it is a very serious difficulty.

913. You say that the profits are taxed; do you know what is the maximum tax on the profits?—No.

914. It will rise in proportion to the dividend that is paid by the companies, up to the maximum?—Yes.

915. Do any of these collieries pay very high dividends?—No. I do not think so.

916. **(Mr. Lorimer.)** We are anxious, of course, to have our figures correct, and I see here that while the coal output in 1889 was 35,609 tons, with a value of 12,805*l.*—just 10*s.* a ton—in 1898 it was 387,811 tons, with a value of 175,015*l.*, and this diagram shows that each year the production is increasing?—**(Mr. Audas.)** Yes, since the war.

917. Since the war there has been unbroken progress?—Yes, there was a check during the war.

918. Does that increased production represent increased export?—Yes.

919. A larger output goes abroad?—Yes.

920. Now, you say the coal is equal to best Welsh. That is the first time I have heard that. I have heard a good many say it is perhaps 10 per cent. less. In any case it must be very dirty?—No.

921. Are there any washing machines?—Almost all the collieries have washing machines.

922. Are they in constant use?—Yes.

923. And the coal is screened to a definite dimension before getting it away from the pit?—Yes.

924. So if it is dirty at all it is inherent in the coal?—Yes.

925. Not in the external shale?—It occurs principally in the way of shale bands, and these shale bands are extracted from the coal.

926. Has the Province been geologically surveyed completely?—No, only very partially.

927. So you do not know very much yet about what mineral wealth you actually possess?—No.

928. Have you any idea from the surveys that have been made how many millions or hundreds of millions of tons of coal you have yet to raise?—**(Mr. Steart.)** Yes. We calculate in the Klip River District there is about 4,369,920,000 tons.

929. And your rate of output at present is what?—About two millions.

930. Then we don't need to concern ourselves about the future?—But that is not all good coal.

931. You cannot raise all that?—No, only a small percentage of it is good coal.

932. But there is enough coal according to that figure to supply all requirements for many generations?—Yes, if some use is found for the inferior coal.

933. Have you any output of gold?—**(Mr. Audas.)** The output of gold last year was under 1,000 ozs.

934. A negligible quantity?—Yes.

935. Was it combined with anything else that you were raising?—In 1910 we had an output of about 10,000 ozs. This gold was derived from a number of prospecting claims. The area of gold is very large, but none of the mines have reached really a proper development stage.

936. You have no expectation of any large quantity of that being got, as far as you know at present?—No.

937. Have you any copper or tin?—Yes. We have quite a number of minerals that have not been mined on a commercial basis. We have very many copper deposits, but they are small and irregular in size. The lenses are very small and uncertain, although the ore is very rich.

938. What percentage of copper do you find in the ore you get?—It varies. We have had some extraordinarily rich ore.

939. Why don't you go on with it?—The cost of following up these small lodes is too great at present. I might say it has never had a proper trial yet. Of course, it may be possible to draw the ore from a lot of these small deposits and smelt it at a central smelter, but that has not yet been tried.

940. You said a little time ago that no iron ore fields had been developed. Did you hear the last witnesses?—No.

941. They gave us some specimens of iron ores, but I suppose these must have been taken from the outcrops?—Yes.

942. There has been no actual working of an iron-field?—No.

943. Now to revert for a moment to your coal: is it sulphurous?—Some of it. According to the general analysis, we get sulphur from 1·2 to 1·6.

944. Is that on the average coal?—Yes.

945. Is some of it higher than that?—Yes.

946. And that is the coal that sometimes goes wrong?—Yes.

947. Have you found, as the coal goes deeper, that the sulphur diminishes?—No, we find that there are certain mines where the coal is more sulphurous than in others.

948. Does depth make any difference?—No, in fact the collieries where the coal is more sulphurous are rather shallow.

949. At the first mines opened in Natal, the coal was very sulphurous, was it not?—No.

950. Does the Natal coal compare favourably as respects Witbank coal?—Yes, it is better than that.

951. And so far as it has been developed at present, it is the best coal in the Union?—Yes, but it is rather thinner than the Transvaal, and more expensive to work.

952. Are your collieries worked under the general mining law?—Yes.

953. A Union law?—Yes.

954. Does that law differ in any material respect from the law under which the mines were worked prior to Union?—Very little.

955. And the Mines Regulation Act, is it at all similar to the corresponding English Act?—Yes.

956. And the mines are rigidly and carefully inspected?—Yes.

957. Are accidents numerous?—Yes.

958. Is that the result of carelessness or the result of the air in the mine, or what?—It is mostly due to the employment of unskilled labour.

959. Would you say the bulk of them are preventable or not?—I should say the bulk are not preventable.

960. How many lives are lost to the million tons of coal?—I could not say off-hand, but the death-rate for the last two years has been 1·9 per 1,000 of persons employed.

961. Do you mean the death-rate from accident?—Yes.

962. And you are referring not only to the fall of coal from the roof, but accidents from bad ventilation and all other causes?—Yes, but accidents from bad ventilation are very few.

963. You are satisfied that the Province has a great asset in the coalfield, and it is likely to develop a great deal more?—Yes.

964. Have you an increasing demand for the coal from foreign countries?—Yes, I believe so, from the East principally.

965. **(Mr. Garnett.)** Just one question in regard to the methods of mining here. Your mining here is mainly by adits, is it not?—**(Mr. Steart.)** No, mainly by shaft.

966. There is no deep mining?—The mining is mostly by shaft, but those are not deep. 700 feet is our deepest mine.

967. Have you many deaths that can be ascribed to bad ventilation or lack of ventilation?—No, our mines are the best ventilated in the whole of South Africa.

968. Now, it has been alleged that there is a considerable waste of coal. It is alleged that waste takes place by allowing the roof to fall in and subterranean combustion taking place?—Yes, in the Hatting Spruit District there are two seams of coal. One is about 3 ft. 6in. thick, which is not worked, and that is generally speaking, about 6 ft. above the seam that is worked, and the seam that is worked is worked on the bord and pillar system; and after the pillars have been extracted the upper seam falls into the goaf and is lost, and in many cases it has led to fires, and we have had a deal of trouble.

969. Are there any regulations either made or to be made with a view to preventing this waste?—I have not heard. **(Mr. Audas.)** On the question of wasting the coal, I may say that the matter has been raised with the object of compelling the colliery to work the second seam.

970. Measures are in contemplation, then?—Well, the question has been raised, but I do not know how far it has got.

971. Can you give any exact value to the coal as compared with Welsh?—**(Mr. Steart.)** It is not anything like as good as best Welsh, in my opinion.

972. Is it as good as 8 to 10?—Not in my personal opinion. I should say 7 to 10 of *best* Welsh.

973. Then, you do not think it exceeds the value of the proportions of 7 to 10?—No, I do not think so.

974. Do you see any prospect of developing the coal trade and the exportation of coke?—Yes, I think so, I do not doubt it eventually. There is not much demand at present for coke.

975. You have, I think, railway rates that are fairly easy for export?—Yes.

975a. More favourable than for coal used for internal consumption?—Yes.

976. Of course, these are matters that you do not offer any opinion on?—Quite so.

977. You do not see any opportunity at present of developing your oversea trade in coke?—No.

978. Is the coal suitable for making the highest class of coke?—No. Not the highest, I should say.

TRANSVAAL.

Pretoria, Monday, 30th March, 1914.

Mr. Edmund Francis Bourke, President of the Pretoria Chamber of Commerce, called and examined.

(For the evidence of this witness on "Animal and Agricultural Produce" and on "Fruit," see pp. 246 *and* 319 *of* [Cd. 7706].)

(Witness.) I would like to put in a statement of the mineral products from the Pretoria District and from our hinterland. The output from the Messina Mine in 1912 was 1,619 tons of copper, valued at 49,142*l*. In 1913, the tons treated were 5,289, of a value of 138,328*l*. I may say that this was the output before the railway reached the mine in 1914. For January and February, the two months available, the output was, January, 908 tons, of a value of 23,412*l*., and February, 1,494 tons of a value of 35,016*l*. I have also figures showing the output of copper from Messina, of tin from Zaaiplaats and also from the Rooiberg.

979. **(Chairman.)** Those figures are interesting as showing the importance of the output?—Yes. The development that has already taken place, the possible development still before us. Also, I have the figures as to the lime output, the manufacture of cement, the Premier Diamond Mine, and the output of coal from Witbank Collieries.*

980. Yes, we have those last two items from other sources?—We wish also to draw attention to the geographical position of Pretoria. It is on the railway at the converging point of the lines from the east, north, south, and Rustenburg Districts. The mineral development of these areas, as well as the agricultural, will flow through Pretoria—the bulk of it—and, flowing through, its nearest way out is through Delagoa Bay. We wish also to draw attention to the great development in the tin areas, which are still being prospected, the development along the Oliphants River, and along the Warm Baths area, and in the north—to the north of Potgietersrust, Zaaiplaats, Grootfontein, and other mines. We would also draw attention to the Messina Copper Mine and the possibilities of great development in that connection. The adjoining mine, next to the Messina, is being completed, and when the railway is up to the property they will be able to increase greatly their development by working the adjoining farm.

Mr. Izaak Jacob Haarhoff, J.P., called and examined.

(For evidence of this witness on "Land Settlement and Irrigation," "Animal and Agricultural Produce," "Forests," and "Fruit," see pp. 45, 249, 301 *and* 319 *of* [Cd. 7706].)

The witness made the following statement:—

In regard to oil shale: I think the Navy could get all the oil they want from this country if people would only put money into the industry and develop it. We have plenty of this stuff in the Transvaal, and I can show you samples. We have had a report on this oil shale which is satisfactory, and some steps should certainly be taken to develop and test it. Unfortunately, our people in Johannesburg are so fully occupied with gold-mining that they will not take any interest in a thing like that.

981. **(Mr. Sinclair.)** Would you be able to produce oil and to stand on your own bottoms, and compete with other parts of the world?—After it has been proved, I daresay we would be able to.

982. Have you given the subject adequate consideration?—I think so, and I can give you figures.

983. You think that this is an industry that could be developed to compete independently of any nursing?—Yes.

Pretoria, Tuesday, 31st March, 1914.

Mr. Percival Ross Frames, Managing Director of the Premier Diamond Mining Co., called and examined.

984. **(Chairman.)** You are Managing Director of the Premier Diamond Mining Company?—Yes. I must apologise for not having sent in a statement, but I have been away a great deal lately, and I have not had an opportunity of preparing one.

985. But you are prepared to answer questions on the subjects on which we wrote to you?—Yes. I think perhaps it might be the best way if I made a verbal statement and then you could ask any questions afterwards.

986. Very good.—This Company started business in November, 1902. The capital of the Company is 80,000*l*. divided into pound shares. Subsequently, these were split up into 160,000 preference shares of 5*s*. and 320,000 deferred shares of 2*s*. 6*d*. The preference shares carry a cumulative dividend of 12*s*. 6*d*. per annum, and the Company has paid in respect of those shares 900,000*l*. in dividends. The deferred shares get the remainder of the profit, and we have paid in dividends 1,400,000*l*. In addition to the dividends that have been paid, we have expended on equipment since the inception of the Company, that is, up to the end of the last financial year, 31st October last, 1,821,356*l*. out of profits. And we have put up a hospital for Europeans, 12,300*l*., and a Recreation Hall for the workmen, consisting of a hall and library and museum, costing 6,700*l*. The total output to the 31st October, 1913, from the commencement of operations was:—Loads hauled: 71,752,221. Loads washed: 65,306,976. Diamonds found: 16,455,704 carats; and the value of the product: 14,960,004*l*. 11*s*. 7*d*. Another question that is on your paper is in regard to the formation and method of working and the sale of diamonds. Well, the mine is a true Kimberlite in a pipe of eruptive origin. The life of the mine, for all practical purposes, is eternity. It is impossible to say what it is, but it is a very much larger mine than any other diamond mine in existence, and though we removed last year 11,028,738 loads, we only lowered the mine by 33 feet.

987. That is how many tons approximately?—Well, a load is nine-tenths of a ton.

988. Say it is ten million tons?—Ten million tons. In regard to the method of working the mine, the diamondiferous ground, as you probably observed when you were out there, is contained within a rim rock. This is broken by means of blasting. The ground is then loaded into trucks by natives, concentrated at a common point, which is called the onset, and there they are drawn up an incline of one in five. It is brought to the washing machine and automatically tipped up by certain control levers worked

* Not reprinted.

by natives. The ground is then thrown on the screens. The fine is passed through the screen, and the coarser and large lumps pass into the big gyratory crushers and they are crushed, and after being crushed it joins the ground that has passed through the screens, and the mass then passes through four-feet rollers and is crushed to a rather large size so as to avoid breaking the big diamonds. This is then lifted, and passed either through pans, which is the old system of working, or over pulsators, and is there concentrated to a certain extent. The overflow is passed through a second set of rollers six feet in diameter, set closely together, and the ground is again crushed and passed through pans or over pulsators. The residue, called the tailings, after the water has been drained from it, is conveyed by trucks and dumped. The concentrates are carried on a conveyor belt up to the sorting house, and from there they pass through tube mills and the ground is further reduced. The residue from the tube mills is then passed through another set of pulsators worked on a slightly different principle to the original pulsators through which it passed, and the ground is further concentrated. Then these concentrates are passed over grease tables travelling in the opposite direction to the flow of ground and water, and the diamonds, together with certain other minerals that we find in the mine, adhere to the grease. The diamonds and the ground that adheres to the grease are then taken and the coarser ground is sorted straight away, and the finer ground is passed over magnetic separators, and certain magnetic substances, such as ilmenite and magnetite are removed. The finest ground is then passed through the blind gig, also a small pulsator, but instead of the concentrates passing through this gig they settle at the bottom by the pulsating movement. All the diamonds then, together with the heavy matter, settles at the bottom, and when it is turned over the diamonds are found in great profusion, and this is also sorted. The whole plant is operated, as you probably noticed, from a central power plant, where we have electric units, and the electricity is conveyed to the different points where it is required, but some of them are direct driven by steam. The water which we use—about three million gallons per day—is pumped from the Wilge River, a distance of 22 miles from the mine at a cost of about 1*d.* per thousand gallons. The diamonds, after being recovered, are weighed by the men in the sorting house—two men are specially in charge there—entered in a register, and next day they are posted to Johannesburg by registered package. In Johannesburg they are assorted and classified into about 1,000 different lots. They are then valued by experts, shipped to England, re-assorted in London by the Company's representative, and there sold to the cutters and others, and the business is practically all cash. In regard to the third question, at the present time the number of white men in the service of the Company is 872. Before the strike, there were about 870 and 41 contractor's men, making 911. The average daily earnings, including the staff, are 20*s.* 3½*d.*, and, excluding the staff, 19*s.* 2½*d.* The average monthly earnings, including the staff, are 26*l.* 7*s.* 9*d.*, and excluding the staff, 24*l.* 19*s.* 7*d.* The average number of hours worked per shift is ten. The total amount earned by white employees, including the staff, for twelve months ending 31 October, 1913, was 261,816*l.* I have here some details in connection with the different departments showing the rate of pay. We have the barrier system at our mine.

989. What is the barrier system?—When a man joins the staff, if he goes into the mine, he begins at ten shillings, and goes on by six-monthly rises until he gets to 13*s.* 4*d.*, and there is a barrier and he has to wait. The rises up to that point are automatic. After that period he has to wait until there is a vacancy in the department above, and then he starts on the minimum in that department, which is higher than the amount he was before receiving, and so he goes on. Perhaps it would be convenient to mention here that, as far as possible, we avoid putting any man over the head of another. Every man coming into the service of the Company begins at the bottom of the ladder. Unless we require a technical man and we do not happen to have one in our service, we never put a new man over the head of another workman already in our service. Then the children of our workmen have the first preference to any vacancy that may occur on the mine, which they may desire to take. In addition to the direct benefits that the men receive from the salaries mentioned, we provide them with housing at a very low cost. We contribute to the Benefit Society on the *l.* for *l.* principle, and this Benefit Society, in the case of the illness of any man, provides all medical attendance, medicine, and sick pay, unless he is in hospital, from the funds, and in the case of the man's death from natural causes, the heirs of the deceased receive 200*l.* In the case of death from accident, they can go up to a maximum of 500*l.*, but in that case the Company takes credit for its half of the contribution in reduction of any compensation that has to be paid under the Workmen's Compensation Act. We have also given the workmen on this property the exclusive right to trade there. All these stores that you saw yesterday belong to the workmen. The Co-operative Society has a capital of 100*l.* divided into shilling shares. Each workman and the Government servants on the property hold a shilling share. No man can hold more than one share. The dividends are paid on the amount of the purchases effected by each member during the year. This Society was started in 1908, and the Company provided the initial capital necessary to enable them to start, which they have paid back in full, and since then they have divided amongst the members somewhere about 80,000*l.* in dividends. The last year, I think, they got a dividend of four shillings in the pound on their expenditure.

990. Is that trade done with whites only or with natives too?—With whites only. The natives are supplied by the Company in the compound, but we give the stores whatever contracts we can, such for instance as the bread contract. They bake the bread and sell it to the Company and the profit made during the last three years from that item alone I think is somewhere about 23,000*l.* But with a view to these men retaining their self-respect, we charge them the same as the man who previously had the concession to run the stores there, namely three per cent. on the turnover. This three per cent., however, the Company does not take. It gives one per cent. to the Benefit Society, one per cent. to the Co-operative Society to enable it to build up a trading fund, and one per cent. is devoted to the sports and recreation club. It gives them about 900*l.* to 1,200*l.* a year for sports, and we are thereby relieved of the obligation of assisting them from time to time when they want prizes and so on. In 1912, we started the Old Age Pension Fund and the Widows' Pension Fund. We dated it back to the commencement of the Company, and the Company paid up all the contributions that would have been due by the men, and by the Company as from the date when they went into the service of the Company. This cost us 85,000*l.*, 5,000*l.* more than our capital, and we now contribute on the basis of 4*l.* for every one pound contributed by the men. At Christmas time, we usually give the day's pay men, in addition to the Christmas Day's pay, two days' pay, and the staff half a month. As I said before, we have provided them with a recreation hall, library, and museum, and when the shooting season is on—I regret that the Directors are not much in the way of sportsmen—but at the end of the season, we allow our workmen to shoot upon the property of the Company. And notwithstanding all this, the men went on strike—or a large number of them—in January last.

The approximate number of natives employed at the present time is 14,000, and the average wage per shift is 3*s.* The average number of hours worked per shift is ten and the average expenditure per shift for the boys is 1*s.* The total amount earned by native labourers for the twelve months ended 31st October last was 611,226*l.* Then there are some other figures which I have here which may be of interest to the Commission. Our minimum daily wage is 2*s.* 6*d.* The wage at which the boys are engaged by the gold mines is 1*s.* 6*d.*, so we allow 1*s.* for food. The minimum wage therefore is 2*s.* 6*d.* For certain fixed jobs it rises to 4*s.* 6*d.* per diem according to the nature of the work. Certain work, for instance,

loading, is done by contract by the natives and drilling also, and the highest daily wage, the general average earned for the year, was 4*s*. 6*d*., for one day in the year, in the case of loading boys, and the lowest daily general average earned for the year was 3*s*. 4*d*. The highest amount earned per fortnight of 12 working days was 1*l*. 2*s*. 6*d*. The lowest amount earned per fortnight of 12 working days was 1*l*. 10*s*. That is the guaranteed minimum. The highest amount earned for one day was 1*l*. 6*s*. That is within the legitimate day. But sometimes these boys sneak into the mine and take two shifts, and sometimes they slip in on Sunday night, work the whole of the next day, and they come out with more, but that is not a fair day's work. In regard to drilling, the highest daily average for the year was 3*s*. 2*d*. and the lowest 2*s*. 11*d*. The highest amount earned per fortnight was 4*l*. 10*s*. and the lowest amount earned per fortnight was 1*l*. 10*s*., the minimum. The highest amount earned in one day was 8*s*. 6*d*. and the lowest 2*s*. 6*d*. The average earnings per boy throughout the year including piecework and overtime was 3*s*. 0·127*d*. The boys feed themselves. We find this to be a very excellent system. They can either buy raw food and cook it themselves, or prepared food, or if the boys wished it we would provide them with rations. But though they know this, we have never had an application on the part of any of our boys to be rationed instead of being allowed to feed themselves. Of course, at Christmas time we give them a treat too. The white men do not do any piecework. It is all day's pay. They are supervisors and overseers, except the mechanics, of course, who have to do the actual manual work in connection with their trades.

Now, as to the method by which the native labour is recruited, and the sources from which it is obtained with special reference to sources within British South Africa as compared with other sources. Well, the Company's system is directed towards the encouragement of a voluntary labour supply from various labour districts throughout British South Africa. We are also members of the Witwatersrand Native Labour Association, which recruits labour in Portuguese Territory. We are at present entitled to receive from the Labour Association about four thousand Portuguese boys, but we have only 1,511 in our service. We do not require the others. Our labour force approximates to 14,000, and is made up of natives from British South African districts 12,157, Portuguese East Africa 1,511, British Nyasaland Protectorate 32. These latter were got many years ago and they have never left us. We do not recruit in the same way altogether as the gold mines do. We have agencies at the different centres in the northern Transvaal, and in the western Transvaal, and in Basutoland we have a man who was formerly in our employ, and he gets a capitation grant for all natives sent from Basutoland. Any boy presenting himself at the mine without the intervention of one of our agents or recruiters gets a bonus of a sovereign. We think it only fair that the black man who comes to work on his own account should be paid rather than that some white person who intervenes should receive it. But the native, of course, receives less.

Now, in regard to the compound; the system in vogue on the property of this Company is what is known as the closed compound, and it is similar in character to that of the De Beers Company, and, I may say, is modelled upon it. The boys do not seem to have any objection to the closed compound system, which is the one adopted by pretty well all the diamond mines, and you will probably have heard that it is much easier to get natives for the diamond mines than for the gold mines, where they have the open compound system.

991. Why?—Well, at one time I thought it was due to the fact that ours was an open working, but in the case of the De Beers Company it is not open. They are underground also, and yet they have little difficulty in getting all the boys they want. There, of course, it is the traditional good treatment on the part of De Beers. They do treat their men extraordinarily well, both black and white, and I may say we try to follow their example, as far as possible, in that respect. And, of course, this contract system is very attractive to the native. He can earn a large amount of money, and in a smaller degree I think they are also influenced by the fact that they may find a diamond and get a handsome reward. Some of these boys have found large diamonds, and they have been overwhelmed by a fortune, as it is to them, in the shape of, perhaps, 100*l*. It would be just the same as if a million were dropped into my lap, to the native. And, of course, that also has its influence. Those are the principal causes that I can think of. I think first the contract system, secondly, the system of feeding themselves, and thirdly, the possibility of finding stones. By feeding themselves they can get just what they fancy, instead of having a rigid ration of mealie meal served out to them, and when a man is tired and has no appetite for mealie meal, which is not always palatable, he can buy just what he likes, and he gets an allowance which enables him to live very well. The food supplied to the natives in the compounds is of the very best quality, and it is supplied to them as near to cost price as we can manage it. The difficulty is that the native does not understand the rise and fall of prices in regard to food. Therefore, you have to fix the price that will carry you through. At the present time, I think, we supply mealie meal, for instance, at a little under cost, but we do supply everything as far as possible at cost price in the way of foodstuffs. The other goods which the native buys we supply at current prices. If we sell for less, the mercantile community outside complain that the boys won't pay the proper prices when they come out. If we charge more, with a view to deterring them from buying, then the mercantile community say that we take advantage of these boys, who are practically close prisoners, to charge them what we like. So we stick to these current prices and find that is the best system, and in regard to food, as I said before, we sell at practically cost price.

Then we were asked for the average period of service of white employees. As at the 1st January, 1914, the average was four years. But the Commission must take into consideration the fact that the first three years of our operations on that mine equalled three months on the present scale. The labour we had was so very much smaller then than now. I will hand to the Secretary a return showing the different periods that these men have been in the service.* For instance, we started in 1902. I think we started with one white man. That is over eleven years ago, and he is still with us. Over ten years, there were 23 men, practically the staff. And so it goes on. But, of course, those figures have been disturbed by the strike. The average period of service of native employees—British South African natives—is about six months, and East Coast natives—Portuguese boys—about twelve months.

It is very difficult to give any approximate figure of the number of boys that return to our service after having left, but I can say that a very large proportion of them do return. They work for six months and then disappear and return again—quite a large number. We were asked for the death-rate. Well, during the last few years we have had very few deaths from accident and disease in the case of the white employees, comparatively speaking. I have

given figures which will be put in for the years 1909 to 1913.* During that period we have had six fatal accidents, and the death-rate from accident has worked out at 1·34. In the case of disease we have had 14 deaths, and the rate has worked out at 3·11 per thousand per annum and the total death-rate per thousand per annum is 4·45.

992. That is deaths from natural causes and accident among Europeans?—Yes.

993. **(Sir Alfred Bateman.)** Perhaps they would go somewhere else to die?—No, why should they? We have a beautiful graveyard and a good hospital. We have good doctors, and they get medicine for nothing, and yet they do not die! Of course, it is largely owing to the men being comparatively young men, and men in the prime of life.

994. You have picked lives and picked ages. I suppose the mortality outside of the mine would be about 7 or 8 per thousand, in any ordinary comunity?—I do not know. I was rather startled myself by these figures, and have almost come to the conclusion that the best place to live is the Premier Mine for a white man. Coming to the natives, however, the figures are not so satisfactory. The death-rate during the last few years in the case of natives, from accident and disease, pneumonia included, is rather higher than we like to see. We give the figures for the years 1909 to 1913, and we give the deaths from pneumonia, and the rate per thousand from this disease. The rate in 1909—the death-rate from pneumonia—was 17·97; in 1910 it was 28·97; in 1911, 26·94; in 1912, 19·96; and in 1913 it was 4·8. I may mention that in 1912 we carried out experiments with Sir Almroth Wright's prophylactic vaccine. We exercised a careful control, and we found that there was a very marked decrease in the incidence of pneumonia in the case of the inoculated boys. We started with a small dose, that suggested by Sir Almroth Wright, 200,000,000 germs, and we afterwards increased this until we got 1,200,000,000 germs for a dose of inoculation, and last year we inoculated all the boys on the property, and we have this satisfactory result. I do not know, of course, that it is the result. The medical profession tell me that it is not. They tell me that we are deluding ourselves, and that the reduction in the incidence of pneumonia is not due to this at all—that the figures have undergone a statistical examination. But I have the result and I am not concerned. I told them that if we had injected pure spring water, and the fall in the pneumonia rate had synchronised with it, we should probably go on injecting pure spring water for the rest of our lives. Then in regard to other causes, we give the death-rate year by year.

995. **(Chairman.)** Are these all other causes?—Yes, all other causes except accident. Worked out for each year, in 1909 it was 5·26: 1910—13·2: 1911—13·8: 1912—13·38: in 1913—8·82. The accidents for the period from 1909 to 1913 worked out at 2·33 per 1,000. The death-rate from all diseases was 23·23 in 1909, and rose in 1910 to 42·17, in 1911 to 40·74, in 1912, when we had a partial inoculation, it fell to 33·34, and in 1913, when all the boys were inoculated, to 13·62. I may mention that our death-rate has always been higher than on the gold mines, and the existence of pneumonia on our mine is also greater. But, at the same time, you do not find a corresponding fall in the case of the gold mines. There has been a slight fall, but it is nothing like the same proportion as in the case of the Premier Mine. Anyway, you would have expected to see us rather behind them than otherwise, but, as a matter of fact, we are ahead of them now.

996. Has there been any other change besides inoculation during late years on your mine?—Well, we put in bunks, and kept a careful record of the results, and we found, as a matter of fact, that the incidence of pneumonia was a little against the bunks. As this matter of the death-rate may interest some of the members of the Commission, I have had a return prepared for six years showing month by month the incidence of diseases, and the different kinds of accidents, and so on,—the death-rate—and I will hand these particulars to the Secretary.†

Then the last question which was asked was as to the amount which the Company contributes directly and indirectly to the revenue of the Government. On the basis of the work for the year ended 31st October, 1913—we have taken it for the the year because that is about our standard—we have paid to the Government:—Native Pass Fees, 18,700*l.*: Post and Telegraphs and Telephones, 4,600*l.*: Licences for boilers, native labour, trading, and so on, 200*l.*: Co-operative Stores, 250*l.*: and then the secretary who has made out this return has rather let his imagination run away with him—Fines, 1,350*l.* That is a very indirect contribution on the part of the Company, and is on account of misdeeds by natives and white men. I do not think we are entitled to take credit for that. Then in regard to railway carriage on coal, 16,600*l.*: carriage on goods from Delagoa Bay, 29,400*l.*: on goods from the coast, 117,400*l.* That is, of course, working it out at what the merchants probably paid, and was included in the price that we paid for the goods to the merchants. We do, as far as possible, buy all our supplies either in Johannesburg or Pretoria. It keeps the population sweet. Then in regard to passenger traffic, including natives brought up to the mine, 41,000*l.* A portion of this only contributes to the revenue of the Union. The ratio we cannot ascertain, because a portion of the railage on boys from Delagoa Bay is Portuguese, but it is only a very small portion, because only a very small proportion of native boys come from there. The native fares come to 24,500*l.*, out of 41,000*l.* The Customs duties are a bit of a guess, 45,000*l.* Purchases in Johannesburg were 373,000*l.*, and we have allowed Customs at 1,500*l.*, because most of our goods

* The return was as follows:—

Death Rate during the last few years, Deaths from Accident or Disease (Pneumonia, &c.), in the case of White Employees.

Year.	Accident.	Rate per 1,000 per annum.	Disease.	Rate per 1,000 per annum.	Total.	Rate per 1,000 per annum.
1909	2	2·34	2	2·35	4	4·69
1910	—	—	5	5·66	5	5·66
1911	1	1·15	5	5·77	6	6·92

† Not printed.

are of British origin. Then on compound supplies we paid 24,000*l*. The purchases for the compounds were 353,000*l*., and that includes the bread contract for 44,500*l*. from the Co-operative Society. The Co-operative Stores supplies were 19,500*l*. That is reckoning 2,000*l*. on the cost of goods paid in Customs. On the bulk of the goods the duty is rebated. In addition to those indirect payments we pay to Government 60 per cent. of the profits made by the Company from its mining operations. For the year ending October 31st, 1913, we have paid 507,614*l*. For the year ending October 31st, 1909, we paid 74,838*l*., but in connection with this must be taken into consideration the Trading and Emergency Fund established at that time—400,000*l*. The Government has a 60 per cent. interest in that, that is 240,000*l*. I give the different years in this return which I am going to hand in to the Commission*, and you will see that for the financial year ending October, 1910, we paid 293,949*l*.: for 1911 — 297,920*l*.: for 1912 — 403,550*l*.: for 1913—507,614*l*.: and the total amount paid by the Company since it started mining operations in 1902 has been 2,586,949*l*., excluding their share in the Cullinan Diamond, which was given to the King. And then we paid a half per cent. export duty on our diamonds, which is supposed to be earmarked for the purpose of detecting and suppressing crime in connection with diamonds. We paid in 1909 the sum of 5,984*l*., going up to 12,469*l*. in 1913, and in that connection we consider that we have a just complaint to make against the Government, because they have not spent the money for the purposes for which it was provided. This is the statement of the figures, and these are the supplementary figures giving more details in connection with the other figures.

997. Does that complete your statement?—Yes.

998. We are much indebted to you for putting the position before us fully. Your statement has been so clear and complete that I have very few questions to ask you. You state that the duration of the life of your mine is eternity?—Yes, for practical purposes.

999. Do you state that on the faith of bore-holes which you have put down in the mine?—Well, we did put down bore-holes. The deepest was fairly close to the rim rock, and we found no encroachment of the rim rock there.

1000. That is, no contraction of the mine?—No, there was no evidence that we could find.

1001. What depth did you go to?—1,000 feet.

1002. And the depth of your present works is what?—The average depth of the mine on the 31st October was 209 feet.

1003. Why did you stop the borehole at 1,000 feet?—Well, at the time, the curiosity of the gentlemen controlling the destinies of the company was satisfied by it.

1004. Regarding your sales in London, how do you sell your diamonds—to a special syndicate or by auction?—No, the diamonds are assorted. It is rather an intricate trade. The diamonds are assorted, as I told you, into probably a thousand different classes. We have buyers for different classes—the manufacturers who cut the diamonds, and the man who buys the diamonds, say this month, has the first right of sight for the next month. We have a value put upon them. The man who buys macles and flats from us, for instance, has been buying that class for a matter of two or three years. In that case, they are the cutters and they manufacture them straight away. We have certain speculative buyers, too. That is how the trade is carried on. We sell to the same people as the Diamond Syndicate sells to, but, instead of having the Diamond Syndicate as intermediary, we have our own representative on a salary, who sells to the same people.

1005. Do you sell in conjunction, or after understanding, with other diamond producers?—Well, there has been nothing in the natnre of a combination or convention, but if there is any idea that we are selling too cheaply, immediate representations are made by either party to the other.

1006. Would you be in favour of an arrangement?—Of a combination?

1007. Yes.—If it is an effective monopoly, yes.

1008. By an effective monopoly, you mean if it includes all producers?—All great producers. You cannot take in all these little people who work on the river, but, probably, if you had such a combination that combination would buy up all their diamonds so as to keep them off the market.

1009. So your condition for an arrangement in the nature of a combination is control of the market?—Yes, that is the point.

1010. In regard to white labour, you have told us that your men stay with you a long time?—Yes.

1011. What enquiries do you make into their records or previous character before engagement?—We make none. We never look at a testimonial. A week usually tells you, a few hours very often, whether a man is any good or not. Before they get the positions of trust they have to go through this rise, and, of course, we weed out the inefficient men, and it is a matter of satisfaction to me to testify that the men we had up to the time of the strike were the very finest body of men I have ever known, they were most ready and willing, contented, and enthusiastic. It was, therefore, with a shock of surprise that we found they went on strike. They admitted they had no complaints against the Company, but they had been derailed by the feeling in connection with the strike, and I personally do not think it is entirely a labour movement. It is just a little disaffection that is going through the world.

1012. I believe on the Rand they have a very large instability of white labour?—Yes.

1013. Here, at all events, the reverse appears to be the case?—Our men remain as long as we will keep them.

1014. To what do you attribute the difference?—I attribute it largely to the fact that the Company treats its men well. There is no difficulty about anyone seeing the General Manager or even myself, if he has any grievance.

1015. Do you attribute it at all to the non-existence with you of piece work and contract work?—I do not think so.

1016. Your system is, in brief, non-contract with white labour and contract with native?—Yes, or, in other words, our contract is with the man who does the actual work.

1017. And not with the supervisor?—Not with the supervisor.

1018. Do you consider that a preferable system?—I think it is the most just.

1019. In regard to the native labour, can you give the Commission the proportion between the natives who are recruited by your various recruiting agencies and those who come freely?—About one-third of our boys come voluntarily without the intervention of the agent or recruiter.

1020. Is that proportion increasing?—It is increasing and has been for some considerable time.

1021. I think it was stated before the Economic Commission that the cost of recruiting for the Rand was 20 per cent. of the total cost of native labour?—Yes. My figures are on the last page of that statement.

1022. You state that your total cost of recruiting natives is 60,000*l*. a year?—Yes.

1023. And the average cost of recruiting per shift worked is 3·58*d*.?—Yes. That is up to the end of the financial year. Since then we have done away with several recruiters to whom we formerly paid a capitation fee, so that this year it will be considerably less.

1024. And do you look forward to the progressive diminution of money paid to agents?—Yes, I do. Of course, the employer always has to have an agency of that kind to assist these boys. A lot of them are ignorant of railway arrangements. They have to be advised as to food obtained along the road, and so on.

1025. However, your expenditure of 60,000*l*. a year would not be accounted for by that kind of organization?—No, that would be a very small thing.

1026. That would probably cost about 20,000*l*.?—Yes. I do not think it would cost us 20,000*l*.; probably 10,000*l*. would cover it.

1027. And you consider that to be a preferable system of remuneration, giving it to the real worker rather than to the recruiter?—Yes.

1028. Does the efficiency of your native labour improve year by year?—Yes, it does, and that is shown

* Not printed.

year by year in the mine where the boys have been increasing their earnings steadily.

1029. Is that shown in these tables?—It is not altogether, but I could give it. I have it in these different annual reports.

1030. I think it would be desirable to have a special statement?—Yes, I will have one prepared.*

1031. These figures would indicate both increase of skill and increase of diligence, would they?—I think they would indicate in a measure both, but I think the biggest proportion would probably be due to the increase in skill.

1032. I do not quite understand to what extent you compete against the Rand in getting natives and to what extent you co-operate with them?—We do not co-operate with them, we are in competition with them, but we co-operate in connection with this Witwatersrand Native Labour Association. We are members of it, and, owing to some arrangement with the Government made by that Association in connection with the Convention, it is not possible for us to get boys from Portuguese East Africa except through the Witwatersrand Native Labour Association. For that reason we became members.

1033. And do you compete within the Union for boys and take a proportion of boys from outside the Union?—Yes, there are certain areas where we do not compete at the present time. We did compete with them in the Cape Colony and we had a recruiting organisation down there. We found we were getting too many boys, however, and as these boys from the Cape Colony are much more civilised and had certain rights, and so on, we thought we had better drop that particular area. They were a little troublesome, so we stopped it and withdrew our competition. In October or December last we had a recruiting agency in the Protectorate on our western border, where we paid a capitation grant, but, owing to the adequate supply of labour we were getting, we terminated the arrangement with those people affecting that particular field. Basutos, of course, we draw more labour from than the whole Rand does. I think the Basutos are very fond of the diamond mines; they have been working in them for years, and they love this contract work, more particularly the loading. They go to the diamond mines more readily than the gold mines, and I think you will find that we have probably more Basutos than the whole of the gold mines put together.

1034. Have you now all the native labour you require?—At present we have.

1035. Speaking generally, during the last few years, have you always had your full complement?—At one time we were lulled into a rather false state of security in regard to recruiting, and there was also a cut in the contract price paid to these boys. Then we had to busy ourselves in getting the boys, but when we brought back the loading price we found no difficulty, and since then we have had no trouble in getting the boys, and we have never been short.

1036. Your experience would appear to show that an increase of remuneration to the native acts as a powerful stimulus to recruiting?—Yes, he is very much like the white man in that respect.

1037. Carrying that argument further, if the native labourer received the money that is now given to the recruiter would that act as a powerful stimulus?—That is the suggestion I made to some of those gold-mining people the week before last.

1038. What is your view of its probable effect?—I think it would do a lot of good, but it must be remembered that in the Cape Colony the recruiter is in a very strong position. He is the trader there and he makes advances to these boys because they get credit. Therefore, he has a control over them and can direct them to go to the mines and work, or to go to different places, and, of course, the gold-mining industry has a veneration for these traders, and they do not like to offend them.

1039. They are more afraid of them than the native is?—Well, I think it is just about equal.

1039A. Have you any views, or are you in a position to form views, regarding the instability of white labour on the Rand?—No, I would rather not express an opinion, but, of course, I have views, although they are not worth anything to this Commission.

1040. Have you any trouble at all with the illicit drink traffic?—We have had a case occasionally, but it is quite a simple matter to control it under the closed compound system. If any liquor comes in you know it must be one of your own men because nobody else can get in without a permit.

1041. Have you had any difficulty with small traders established round the mine?—Well, the area round the mine is our private property, and they cannot come there without permission, so they camp out in the road, that is, the hawkers. We have had one case of illicit diamond buying in connection with one of them, but generally they do not give us any trouble.

1042. Then absence of difficulty is due rather to the absence of the trader?—I think so largely. On the Rand, of course, it is quite different. When we acquired this mine, there were none of these awkward things called vested rights. In Kimberley, of course, they had those, and they could not get rid of the population, and they could not restrict these people from trading.

1043. Do you suffer less from illicit diamond buying than others?—I think we do, because we handle our stuff less for one reason, and secondly, our mine is poorer. You know in some of these places the illicit diamond buyers will give all sorts of facilities and credit to white men, and when they get that credit and they cannot pay, these buyers say to them, "Well, you can pay us in another way." That has been known to happen.

1044. Now turning to the question of the death-rate. Your figures regarding white labour are extraordinary. With regard to natives, do you attribute the remarkable fall in your death-rate both from pneumonia and from other causes solely to inoculation?—No, I attribute it principally to inoculation.

1045. The fall in the death-rate from pneumonia is coincident with the great fall in the death-rate from other causes?—Well, it was an extraordinary thing that when we had a control, and it was a random control, there was a very material decrease in the cases of disease among the inoculated boys. I mean other diseases too, but I am told that that is not extraordinary, that it happened in the case of prophylactic inoculation for typhoid, where you had a fall in other diseases. Why it should be so, I do not know. One or two medical men have raised this question, and it has been discussed, but I am not competent to judge. All I say is that the fall in pneumonia synchronised with the inoculation, and we have close on 14,000 boys. We have 260 boys alive to-day who have no business to be alive. They ought to be dead.

1046. Have those figures been discussed by any medical society or scientific body?—Well, they have been submitted to the Statistician of the South African Institute for Medical Research for examination and criticism. I happen to be Chairman of that Institute.

1047. Have you got his observations?—Yes, but they have been marked confidential.

1048. Does he wish them not to be used?—Yes. As a matter of fact, he has discussed two factors of error which he says are present. I have put those to our medical man, and he says they are both incorrect. In one case he has assumed an incident as a fact which was not in existence.

1049. So that, speaking as a non-technical man, you consider those averages to be correct?—Well, they are very striking. The records are correct.

1050. And you are aware of no perverting element?—I am not aware of any. I have this fact, that the

* The witness subsequently furnished the following statement :—

I am sorry to find that the increases in the earnings of natives do not reflect to the extent I thought the increase in the efficiency of the native labour employed at the Premier Mine. A large number of boys are engaged on machinery and other work at fixed wages because it is impossible, from the nature of their employment, to pay them by results. In determining the progressive efficiency of boys employed on piece work it is necessary to take into consideration several factors other than the larger amounts earned by them, such as the very important one of the much greater hardness of the ground handled latterly, which makes both drilling and loading more difficult. Since I gave my evidence I have discussed this question with the General Manager of the Company, who agrees with me that the improvement in efficiency is undoubted and very marked.

Statistician, who is also a clinician and a doctor, has reported, in the case of the experiment carried on in connection with tropical boys by Sir Almroth Wright's assistant, that in that case prophylactic inoculation proved or brought about immunity from the disease for a certain time. He has made that statement, and I have this fact that we had a fall from the same moment that we began this inoculation, and the ordinary man in the street draws only one conclusion. He may be wrong, of course. But there it is.

1051. Has Sir Almroth Wright made any observations?—He has prepared this report for the Witwatersrand Native Labour Association. He was brought out by them. I do not know whether you have seen the report?

1052. No. That was a report suggesting certain measures?—No, a report on this vaccine that he prepared.

1053. Has he considered the figures that you are now giving us?—I think they are pretty well all included in his report. He has been getting our reports also from time to time and he is satisfied.

1054. What is the date of his report?—I think somewhere about December last.

1055. It was made to——?—The Witwatersrand Native Labour Association. I think they will be giving evidence before you. And the other report is Dr. Maynard's on the Tropical Experiments.

1056. Who is he?—Dr. Maynard is the Statistician of the South African Institute of Medical Research.

1057. What is the date of that report?—December, I think.

1058. Is that also in the possession of the Witwatersrand Native Labour Association?—That is only in the possession of the Institute of Medical Research.

1059. Is a copy of it obtainable?—I can give you copies, of course. And then there is another report by Dr. Lister, which carries the thing a good deal further. He has made a discovery at the same time that a similar one was made in America, that there are certain strains of pneumonia, and he has written a paper in connection with this which opens up a wide field for investigation. A most interesting thing.

1060. **(Mr. Lorimer.)** Some of us had the pleasure of going over your mine yesterday. We also went over the Kimberley Mines. I think I am right in saying that the most obvious difference in your methods is that you do not weather your blue ground but send it at once to the washing machines?—Yes.

1061. So that, in point of fact, you may have a diamond in the mine in the morning and in the strong room in the afternoon?—That is so.

1062. Now, does this pulsating conical roller never do any damage to a diamond?—Yes.

1063. What are the rollers made of?—Steel—hard steel.

1064. Do they scratch the diamonds?—They cannot scratch them but they may fracture them, and then we get the pieces.

1065. I will ask some questions on the notes I made yesterday and what you have given us to-day. Does all the land round your mine belong to the Company?—We have two farms there.

1066. Were the houses round about the mine built on your land?—Yes.

1067. Are they owned by the Company or the men?—The majority by the Company. The men pay rent for them.

1068. Some of them hold their own houses?—Yes.

1069. If they leave their employment, how do you deal with them?—We buy the houses back at a valuation.

1070. Your Pension Fund seems to be treated in a very liberal manner by the Company. You had a strike in January last?—Yes.

1071. Do the contributions on both sides cease during such an occurrence—are they suspended?—No, we dismissed these men that went on strike.

1072. And did they sacrifice their contributions?—They got their own contributions, but not their entrance fees.

1073. Did you take any of these men back?—Only one apprentice.

1074. What qualifies for pension? Is it age, or infirmity, or both?—Well, both. If the General Manager certifies that a man during the course of his employment has become unfit to carry on his work, he can be pensioned off.

1075. And that would apply in the case of accident, or old age, or infirmity?—Yes, and in the case of his death, his widow and children (under 17 years of age) get the pension.

1076. Now, I have a note that the highest amount earned in a fortnight by a native was 11*l.* 2*s.* 6*d.*, and the lowest 1*l.* 10*s.* Would you explain the extraordinary difference?—Yes, you have seen it in the case of white people, have you not?

1077. You mean that there is such difference in the working capacity of the natives that one may be able to earn about eight times as much as the other?—That boy is one amongst thousands. That boy is only put in as an illustration. There are not many that earn it.

1078. Is the small wage the result of inexperience, to begin with?—No, but that boy probably slipped into the mine on Sunday afternoon, and, when darkness came on, he went to work and worked all Sunday night and the whole of the next day.

1079. And you find some eager to work and earn money, and others who are not—just like white men?—Yes.

1080. And you said, I think, that the boys feed themselves and there is no application of the ration system. Is the result satisfactory?—Yes, quite.

1081. You do not find any of them inclined to starve themselves in order to save money?—We were told they did, but I have seen no evidence of it. They feed themselves very well. I do not know if you had an opportunity of going into the compound?

1082. Yes.—You noticed they looked sleek and fit.

1083. Yes. But one thing you said perplexed me. You said the white men are supervisors and overseers and they are on contract work?—No, not on contract work. On day's pay.

1084. White men are all paid a day's wage?—Yes, or a monthly wage—after reaching a certain standard he gets a monthly wage.

1085. You said you were entitled to 4,000 Portuguese natives and you had only 1,511. The Portuguese boys stay twelve months on the mine and the South African boys only six?—Yes.

1086. Why don't you have more Portuguese boys?—Because the other boy is cheaper. He costs less to get. We have to pay 5*l.* to the Witwatersrand Native Labour Association for every East Coast boy we get.

1087. Now, about this death-rate—those are extraordinary figures that you gave us. What is this prophylactic preparation with which you inoculate the boys?—It is not a serum but a bacillus culture.

1088. Is it supplied or do you make it up yourselves?—We make it up at the Institute.

1089. Then, you say the doctors deny that this inoculation has caused a decrease in the death-rate?—Some of them.

1090. Your own men or outsiders?—Outside of our own men.

1091. And do they attempt any explanation?—No.

1092. Because, I suppose, you can attempt no explanation?—No.

1093. And this extraordinary reduction is in pneumonia?—Yes.

1094. Have you a reduction in the numbers attacked or in the death-rate or both?—In the numbers attacked.

1095. And, of course, an enormous reduction in the death-rate?—Yes, but the case mortality is pretty well the same.

1096. This prophylactic has the effect of making the man immune, has it?—Yes.

1097. But if they are attacked they go down as before?—Yes, it is not curative.

1098. You gave us a lot of figures regarding your contributions to the revenue, which are very large. But you would not call railway carriage and posts and telegraphs and so on taxation in the sense of the 60 per cent?—No. I only answered the question that was put to me. I think it is piffle.

1099. You gave us 16,600*l.* for the carriage of coal; but that is a service rendered?—Yes. That is why I call it "piffle." If you get something for your money you have nothing to complain about.

1100. How do you sell your diamonds, in the open market?—Yes.

1101. Not to a syndicate?—No.

1102. Do you set your output to meet the conditions of the market?—No, nature is doing that for us. When we commenced there we got extraordinarily good results, but we have had to increase our operations from time to time owing to the fall in the richness of the mine, so that any intelligence that is lacking on the part of the directors in restricting is made up by nature.

1103. Now did the mine pay from the beginning?—From the very first day.

1104. And has the production been practically uniform from the beginning?—No, it has been falling.

1105. I have a table here from which it appears to have recovered rather in the last two years? It is about one-sixth of what it was to begin with?—Yes.

1106. The fall has not been continuous but very nearly so?—Yes.

1107. You said the life of the mine was practically eternity?—Yes.

1108. I suppose you mean it will certainly last as long as any investor would ever dream of?—Yes.

1109. You are down to 210 feet now?—A little more.

1110. You take off about 30 to 35 feet a year from the bottom of the mine?—Yes.

1111. And, therefore, before you get to 3,500 feet, which is something like the depth of one of the De Beers mines, 100 years will have elapsed?—Yes.

1112. Have you ever made any estimate as to the depth which such a mine could be economically worked at?—Well, it will very much depend on the conditions when you get down.

1113. Precisely?—Naturally, if there has been an eruption down below you would expect that as you got down you would find a gradual contraction; in some cases it may be rapid.

1114. But I am thinking rather of the temperature?—I should think as deep as any gold mine in existence. They reckon they can work down to 7,000 feet.

1115. The cost of haulage would be very much increased at such a depth?—Of course.

1116. But it is a matter that need not concern the existing generation?—No.

1117. I noticed in your foundry yesterday that you used Durham coke—not Natal coke?—We are now using some South African coke.

1118. You know what is the cheapest for yourselves. But what I wanted to get at was this—the Durham coke comes in at such an extraordinary price here—you get it at 35*s.* a ton at home and here it is 7*l.* 10*s.*?—Yes.

1119. Well, now, what do you pay for bringing that from Delagoa Bay to the mine?—I do not know. There is the sea freight, of course, to begin with. I do not know what it is from Delagoa Bay, but from Port Elizabeth the carriage is nearly 6*l.*

1120. Do you think 5*l.* 15*s.* would represent the sea carriage and the railway carriage?—That would be about it.

1121. It must be divided between them, but it seems to be rather excessive?—I think that is about the charge.

1122. Now in regard to the sons of your white employees—do you make them apprentices to the ordinary trades, such as fitters, blacksmiths, and so on?—Yes.

1123. Have you any technical institute attached to the mine?—No.

1124. So they get no technical training?—No.

1125. They have to go elsewhere for that if they want it?—Yes, but I may mention that that very matter was before the Board yesterday, as to giving them some technical education. It has been considered. But that was not as a result of this Commission visiting us.

1126. **(Sir Jan Langerman.)** You gave 60 per cent. as part of your contribution to the Government?—Yes.

1127. Do you regard that as taxation?—No. The question was put to me—the amount we contribute directly and indirectly to the revenue of the country.

1128. The Government treats that as revenue. They do not set it apart?—No. They ought to have, as you know, under the Act. But they have been pilfering.

1129. Now about disease: of course, you have had a big drop from 19 per 1,000 to 4 per 1,000 for pneumonia. Now if the same treatment were applied in Johannesburg, where they have the open compound, do you think it would have the same effect as here?—Well, that is the point I referred to just now about Dr. Lister. He has discovered these different strains of pneumonia, and it opens up a field for further investigation. It may be that we have been supplied with the vaccine of a particular strain that corresponds to our strain. Dr. Lister concludes that if you were to get one strain and inoculate boys who were allied to another strain it would be quite ineffective.

1130. It is something like the violin then—you must be tuned to it?—You must find what the strain is.

1131. You said, I think, that you promoted your men by seniority. Do you not regard their capabilities?—It does not go by seniority. But if there is a man who is fitted to do the work and he has been longer than another he is promoted to the post.

1132. Whether junior or senior?—Yes.

1133. You induce your juniors to work themselves up?—Yes.

1134. You compared 1*s.* 6*d.* as the boys' wage on the Rand with 2*s.* 6*d.* on the Premier Mine?—Yes.

1135. And you give the pay that a Kaffir can earn on your mine. That also applies to Johannesburg: he does not remain at 1*s.* 6*d.*?—Well, they had what they call the average maximum pay which you have possibly heard of.

1136. 2*s.* 3*d.*?—You had an average maximum pay and we have the average minimum pay. No average maximum pay.

1137. So, anyhow, on the Rand the native can also earn as much as he likes, can he not?—Can he?

1138. Is it not correct that he gets so much per day, and if he makes more by putting in so many holes he can practically earn what he likes?—I do not know what the practice is. But I have heard something about this average maximum, which I do not understand. You know what I mean.

1139. Now, about the migration of white men from one mine to another which takes place on the Rand. Of course, on your mine you say they do not change much because they are men who understand their work?—Largely, and, of course, there was no occupation next door for them to go to. If you had a range of mines next door to each other, as you have on the Rand, I daresay there would be a lot of changes, because when a man loses his job on one mine he goes next door.

1140. But is not the basic or fundamental reason for this constant migration on the Rand the inefficiency of the men?—I am not in a position to speak on it. But take your mechanics, I believe there is a good deal of interchange there, too.

1141. **(Mr. Bowring.)** Do you find much difference in the labour of the various tribes that you draw from?—Well, you find that, for instance, the Basuto limits himself almost entirely to loading. The East Coast boy to drilling, or anything connected with machinery. He loves to work with a bit of machinery. The Transvaal boy is the most useful all-round boy. He will do loading, tramming, drilling, or anything.

1142. And they work almost entirely on contract. You give them as much piecework as they like—or do you limit them?—There is no limit.

1143. You allow them to earn practically what they can according to their strength?—Yes, there is certain work, such as developing, that you cannot put out to contract, except paying for the actual drilling; but where you can measure the work you put it on contract, and they can then earn practically what they like.

1144. And their minimum wage is 2*s.* 6*d.*?—Yes.

1145. You are of opinion that you will, in the near future, bring the health of the natives very nearly to correspond with the whites, under your new regulations?—That is my hope. But I do not know whether it will come about. Of course, we consider last year's death-rate a great achievement in that direction. We are not satisfied with it, but we are delighted with it.

1146. And you seem to be working in that direction really by bringing the two very close together—the native death-rate and the white?—Yes. But we never hope to bring the native death-rate down to that of the white men, because that is extremely low.

1147. Is that because of the difference in their work?—No, but I think the native is much more liable to change in the condition of his life and so on.

1148. You think they are more subject to disease than white people?—Yes. The white people acquire, in the course of time, immunity to certain diseases. Take a place like Johannesburg. Pneumonia is rife there. The natives have it and it is believed to be infectious. But you do not find the same proportion of white people getting it as the blacks.

1149. So it is not because of their work being more onerous or disagreeable?—No, I do not think so.

1150. **(Sir Alfred Bateman.)** You have a system which seems to differ from that of nine-tenths of the business people—that is, the system of promoting by seniority?—No, I should like to explain that it is not promotion by seniority. But I said we do not bring a man from outside and put him over the heads of men in our service. Supposing that we have a vacancy and one man has five years' service and another three—if the five years' man is not capable of filling the vacancy and the three years' man is capable, we should promote the three years' man.

1151. Then you do not look to see which is the best man when two are both capable?—No, as long as a man is capable.

1152. But you attach great importance to seniority?—I attach importance to contentment among the men.

1153. And you seem to be working for that all the time?—Yes.

1154. You have never tried the system of co-partnership, I suppose, as far as your white workers are concerned—that is, giving them a share in the profits?—We have given them the trading rights and we cannot give much more when we have to give 60 per cent. to Government.

1155. You have not given it—it is taken from you?—Well, we do not get it, anyhow. And then we pay a considerable amount of indirect taxation. You must really leave us some part of this 40 per cent.

1156. I ask this because I have been connected with the London Gas Companies for some years as Government Auditor, and they have had a system of co-partnership for 17 years?—Somebody tried it up north, I think, and it did not come off.

1157. There were not always profits?—No. Well, we have gone very close to that, too. Many times we have passed dividends.

1158. That is your answer?—Our capital is small, it is true. We have been told that we financed the company stupidly, but we made the capital small and the dividends seem large in consequence. But if we had capitalised this company on what the equipment cost us, the dividends would be small.

1159. Anyhow, you have never considered it?—I discussed it with Mr. Wagner, one of the former Directors of the Company, who is now no more on the Board. I discussed the subject frequently, but in the end we came to the conclusion that doing all we could to improve the condition of the men in these various directions would be preferable to the other system.

1160. They even make some workmen directors in the London Gas Companies.—Well, they can go on experimenting. I am not prepared to follow their lead in that respect.

1161. On the drink question—do not your Portuguese boys require wine?—They like it.

1162. Don't you give it to them?—No, we would get six months without the option.

1163. Surely, seven years ago, when I was here the head of the Portuguese recruitment officers told me that it was a condition of their being allowed to work down here that they were to get a bottle of Portuguese hock?—No, not in the Transvaal. The penalty is six months for the first offence.

1164. They want it, don't they? They are used to it?—We give them kaffir beer instead. We supply all the boys with it.

1165. One other question: You do not know the ages of your boys?—No.

1166. You have no idea of the average age?—No.

1167. Would it be 30?—I think the average would be younger than 30.

1168. **(Mr. Sinclair.)** In answer to the Chairman, you spoke of the increase in the skill shown by the worker after he had been with you for a certain time. Is that progressing or is it limited?—Well, of course, it is limited in any man's case.

1169. What I had in mind was this: Do you suggest that the limit of his efficiency is reached after he has worked for you for a certain fixed period or is it capable of still progressing?—I think that taking it on the average, they have got pretty well on our mine to the limit that a man can do in a day.

1170. Is there any future development in the native himself?—I will put it to you in this way. I think that the quantity of work done by the native on that mine is equal to the average that would be obtained from white men doing the same work.

1171. Having reached that stage of efficiency, is he capable of still further advancing in other work, in your judgment?—Yes, I think he is capable of doing more than he is doing to-day.

1172. You understand I am not speaking as to the quantity but as to the quality of his work?—You mean whether he can do a certain amount of skilled work?

1173. Yes.—Yes, he does do it, too.

1174. And is his capacity for skilled work progressing?—Yes, anything that is mechanical. There is also a considerable margin for improvement still.

1175. You told us, I think, that you have 14,000 natives and that they stay with you for about six months?—That is, the boys outside Portuguese boys.

1176. And you also said that a considerable proportion came back?—Yes.

1177. Do you find that the interval of rest or other occupation which they take tends to strengthen them and make them more resisting to disease?—Well, of course, there is a certain immunity by the length of stay at a mine. When you get the boys the death-rate is very much higher at first in the case of new boys than at any time afterwards. But the returned boy has already acquired a certain immunity and I think his death-rate is better than in the case of entirely new boys.

1178. But you would say, would you not, that the spell which is taken has a beneficial effect on their health?—Naturally.

1179. Now, I take it—we were told so at Kimberley, and I suppose it is so here, too—that when there is a death in the mine from accident or disease, inquests are held?—Not in the case of disease.

1180. In the case of accident there is an inquest?—Yes. There is always an enquiry by the Mines Department. An official is sent out. If it is only a minor accident—not fatal— there is also an enquiry held.

1181. But there is no enquiry if a man contracts pneumonia while working in the mine and dies?—No. You get a death certificate from the mine medical man. It holds good just as in the case of a white man.

1182. Is there any periodical examination of the native while he is working concerning his liability to contract the disease?—No.

1183. I mean to see if he has got it in the initial stage?—No. In the case of pneumonia there is no such thing as an initial stage. You get it and you go down the same in the case of white as black.

1184. Do I understand by that answer that there is no examination of the man until he goes down?—Exactly. If a boy is seen with his leg bandaged up the doctor gets hold of him and examines him, but until a boy complains we do not examine him. It is impossible to have regular medical examination of your boys where there are 14,000 of them.

1185. Now, in regard to your system of old age pensions and payments to widows, in the case of the death of the white worker, is there a similar provision in the case of the coloured worker?—No, he makes no contribution. His period of service is six months.

1186. If he meets with an accident and dies in consequence?—He is compensated under the Act.

1187. On a scale that I take it is fixed by statute?—Yes.

1188. You told us what the capital of your Company is. Can you tell us—are the shares registered?—Yes. In the case of the deferred shares, they are all registered in the name of the shareholder. In the case of the preference shares, a certain number of them are bearer warrants.

1189. Can you tell us, approximately or roughly, in what countries the shares are held?—It is very difficult. Take one shareholder who is resident in London. He has his shares registered here with a South African address. Would you consider him a South African holder or outside?

1190. My point is this: I would like to know to what extent the profits were distributed within the Empire. A considerable proportion of the shares, I suppose, are held on the Continent?—There is a certain proportion.

1191. Where would you say is the domicile of the largest number of shareholders?—In London.

1192. And they are absentees I take it so far as the Union is concerned?—Yes. Of course, we pay income tax to the British Government too. I did not put that in the return.

1193. You have told us what the view of experts is as to the life of the mine; do you find the quantity and quality maintained as you go down?—No, it is not.

1194. Is there a material difference?—The figures in this balance sheet show that. The original production was 1·29 carats to the load. It is now ·202. In regard to the price of diamonds, when we first started the value per carat was 1*l.* 7*s.* 8*d.* and last year it was 1*l.* 2*s.* 2*d.*, but we have had falls between, of 18*s.*, 14*s.* 9*d.*, 12*s.* 6*d.*, 13*s.* 11*d.*, 16*s.* 1*d.*, 1*l.* 0*s.* 1*d.*, and 1*l.* 2*s.* 2*d.*

1195. You spoke of taxation—do you pay taxes based on the life of the mine?—No.

1196. That is not an element—the duration of the life of the mine is not an element in fixing the quantum of your taxation?—No, the law was passed after our mine was discovered, under which we pay 60 per cent.

1197. And the probable duration of the life of the mine is not a factor that is taken into account in fixing your taxation?—No. They could not have got at that time any idea of the duration of the life of the mine, because some of the experts at that time said it was no mine at all, but only a surface wash.

1198. **(Mr. Garnett.)** I should like to return to one point that Mr. Sinclair referred to—he asked about the boys who returned to the mine—those who only worked six months. You said you thought their figure of productivity was increased by the rest?—I said "naturally."

1199. Now do you find that those who contract for twelve months are inferior in that respect? I mean do you find fatigue set up?—No.

1200. Their productivity at the end of twelve months is as great as at the end of six?—Yes. I think it is.

1201. Do you find any falling off at the end of six months in the factor of efficiency, as between six and twelve months?—No, I think there is an increase during the second six months.

1202. The increase of skill probably makes up for any fatigue?—Yes.

1203. Your death-rate figures are very extraordinary. Although your men are living in a pretty densely populated condition I take it you are not troubled with any epidemics underground?—We had a rather bad epidemic of typhoid fever in January.

1204. You are not wasted with such things as small-pox?—No. Every native that comes here is vaccinated. As soon as he comes to the gates he is inoculated for small-pox and pneumonia. There was a case of small-pox out there some little time ago, and all the natives round the district came to our people and were inoculated.

1205. Now, being an open-air occupation, I should imagine you are not troubled much with tuberculosis?—I am sorry to say that is evidently on the increase.

1206. Can you put that down to anything? Is it the effect of 14,000 natives being congregated together?—No, it is not limited to us. It is all over these mines.

1207. Where men are congregated together?—Yes. It is simply infection, I take it. And it is peculiarly rapid and fatal in the case of the natives.

1208. What would be your death-rate?—It is very small now. But that is one of the things that is engaging the attention of this Institute of Medical Research. The figures are anything but reassuring.

1209. In the northern hemisphere one knows that where large numbers of people are crowded together and live in the same confined space there is a tendency for tuberculosis to increase largely?—Yes. If you have one infected person in a room you are liable to infect a large number of people. But this country has always been looked upon as a sort of health resort for people with pulmonary affections, and it therefore causes us anxiety to find this disease spreading among the natives to the extent it promises to. Representations have been made to the Government to have tuberculosis made a notifiable disease, and people suffering from it should not be allowed to go into mines, and so on. I think it will become absolutely necessary.

1210. The matter is receiving very serious attention?—Yes.

1211. Where is this Institute of Medical Research?—In Johannesburg—on the hill by the hospital.

1212. **(Mr. Lorimer.)** You have quite a moderate rainfall here, have you not?—Yes.

1213. Where do you get your water from?—We pump it from the Wilge River—22 miles from the mine.

1214. Have you storage tanks?—We have a dam.

1215. The water we saw yesterday is used over and over again?—Yes.

1216. Still, you require to supplement it. Have you any wells in the neighbourhood just beside the mine?—No.

1217. Everything has to come from the Wilge River?—Yes.

Johannesburg, Thursday, 2nd April, 1914.

Mr. Robert Nelson Kotze, B.A., Government Mining Engineer, called and examined.

1218. **(Chairman.)** What is your official title?—Government Mining Engineer.

1219. And you are in charge of——?—The Technical Branch of the Mines Department.

1220. Which includes the Witwatersrand and all mining areas?—Yes, in the whole Union.

1221. Now, confining ourselves for the moment to the Witwatersrand area, can you give us any general figures, or could you put in any statement, showing the present position of the industry?—I have brought a copy of the monthly statistics we publish,* and also advance copies of certain annual statistics we publish.

1222. Then that brings the information regarding the mines fully up-to-date?—Yes, and the diamond production for the year.

1223. Do these tables show the present yield and cost per ton?—No, we do not collect statistics regarding the costs per ton—only the amount of production and the value of production.

1224. Of course, the yield per ton and cost per ton at the present time, as compared with the past, would be obtained, I take it, from the Chamber of Mines?—Yes, regarding the Witwatersrand mines.

1225. Do these tables also show the total working force on the mines—white and black?—Yes.

1226. In regard to the table, which I see was published in the minutes of evidence* of the Commission

* Mines Department, Union of South Africa, statistics for the month of February, 1914.

* T.G. 2—1908.

which inquired into the mining industry, pages 253 and 255, I do not know whether those are figures which you could give us brought up-to-date?—Yes, a similar table could be given either by me or by the Chamber of Mines.

1227. Could you give it or could we get it from the Chamber of Mines?—As far as the value is concerned, I do not think I could give you that. That is the market value at a particular date.

1228. What we want is this table brought up-to-date?—Well, I think the Chamber of Mines would be in a better position to furnish it than I.

1229. And the table on page 255 also—the upper one?—I am afraid I may not be able to give you that. The position is this, that estimates are made for the purposes of the Profits Tax of the lives of the mines, so that I know on what date they estimate that they will cease production, but the information is confidential.*

1230. Are there any further statements you desire to put in before proceeding to the questions?—Well, I have received a number of queries.

1231. Those we will go through orally?—There is something about the coal resources of the Union, if you would like information about that. It is contained in this publication: "The Coal Resources of the World," which was an inquiry made on the initiative of the Executive Committee of the Twelfth International Geological Congress in Canada. The second volume, p. 411, contains the official statements.

1232. We can take that as being your present estimate?—Yes, it is practically up-to-date.

1233. We do not want to go over the ground covered by the Economic Commission, or into the evidence given by the Chamber of Mines to the Economic Commission, but I would like to ask you one or two questions regarding certain statements made. First of all, what is your view as to the estimate of the life of the mines furnished to the Economic Commission by the Chamber of Mines?—I should like to point out, in the first instance, that the Chamber of Mines did not furnish an estimate of the life of the Rand; they furnished an estimate of the life of the producing mines.

1234. And that is to say the life indicated will be increased by the life of the mines not yet producing?—Yes; or not yet existing. There are certain areas which do not belong to any companies at all—open ground.

1235. Which areas would increase the estimate given of the life of the Rand?—Considerably. As far as the estimate of the life of producing mines is concerned, I have no serious criticism to offer on the estimate of the Chamber of Mines. Their estimate, I think, was 550 million tons of payable ground which can be taken out of these mines. My estimate is 587 million tons. I would like to explain, in that connection, that the Chamber of Mines made no estimate of the tonnage to be derived from other areas not belonging to producing mines, and such estimate is very difficult to make. The data are very uncertain, and such data will naturally, in the course of years, alter very greatly. If we look back at the estimates which were made ten years ago, and compare the data then assumed as to cost of production and pay limit with the same figures to-day, there is a very great difference, and the same thing will happen ten years hence—the same change will have been made again. Take the cost of production ten years ago. We could not indicate then in what direction economies would be effected, and to-day we are in the same position, but nevertheless it is practically certain that economies will be effected.

1236. Comparing to-day with ten years ago, has there been a great diminution in the cost of production?—Very considerably. I cannot at the moment give you the exact figures, but it is probably in the neighbourhood of 6s.

1237. And do you indicate as probable a further reduction of a similar nature?—I certainly think it probable. I am not able to indicate the direction in which these economies will be effected, however.

1238. And you cannot indicate the causes which will produce those economies?—Exactly, but, roughly, I may say that, as far as other areas to be still opened on the Rand are concerned, it is not improbable that they will yield as much as the existing producing mines.

1239. As much gold or payable ore?—As much payable ore. I am taking them on a very conservative basis and discounting very largely.

1240. You say the areas not yet touched by producing mines will yield as much gold as is produced by what?—By the existing producing mines.

1241. What the existing producing mines have produced up to now?—No. The 587 million tons is what I estimate they will produce. The amount of payable ore in the areas not yet belonging to producing mines will be at least equal to that.

1242. Now what capital do you estimate will be required for the development and exploitation of that area?—That is a very difficult question to answer. I can only give you an idea of the order of magnitude—whether 500,000 or 5,000,000 or 50,000,000. I think the order of magnitude will be between 50 millions and 100 millions of new capital required. Put it at 50 millions for the time being. But it is more of a guess than anything else.

1243. That estimate is based upon the capital recently required for development of certain areas in that locality, is it?—Yes.

1244. Well, now, you indicate a probable further considerable reduction in the cost of working. Will that proceed from further economies in the use of native labour or white labour or stores?—I would not put it in the direction of economy of white labour and native labour and stores, but rather in the direction of efficiency. We divide the costs of working between white wages, native wages, and stores, and to effect economies you must reduce one or the other, or all three. I think the chances are that all three will be reduced, not so much by reduction of wages as by increase of efficiency.

1245. The individual worker will receive as much as or more than he receives at present, but his work will be applied to better effect?—Exactly. I can give you some figures as to efficiency increase in the past as far as tonnage is concerned. I may say the tonnage has increased per head of labour employed. In 1904 and 1905 we milled 103 tons per coloured person employed. In 1910 it advanced to 131·9 tons, and last year it advanced to 143·3 tons, so since 1904 and 1905 up to 1913 there has been an increase of nearly 40 per cent. in the tonnage milled per coloured person employed.

1246. Have you any similar figures for white labour?—It has gone up from 801·9 to 1149·2 tons.

1247. Is that owing largely to the further introduction of rock drills?—Very largely.

1248. Can you give the proportion of machine drills to hand drills?—I can give you the tonnage broken by machines for 1913 as compared with the total tons of rock hoisted, which will give you a fair idea. The total tons broken by machines in 1913 were 13¼ millions; total tons hoisted 29,832,000. So the tonnage broken by machines is thus nearly 45 per cent. of the total hoisted.

* Mr. Kotze subsequently explained that the information in question was regarded as confidential only as far as regards particulars as to the probable life of individual mines, and he accordingly furnished the following table showing the number of mines that would cease production at different dates based on the lives as fixed for Mining Taxation purposes, together with the number of stamps they dropped, the value of gold they produced, and the dividends they paid during 1913:—

Period.	Number of Companies ceasing operations.	Stamps dropped by these Companies during 1913.	Value of gold produced during 1913.	Dividends paid during 1913.
			£	£
1914	2	140	224,929	28,875
1916	3	570	1,820,047	635,000
1917	3	390	1,755,317	613,500
1918	5	520	1,465,921	457,402
1919	2	255	631,676	204,000
1920-1924 ..	10	1,090	4,074,393	1,184,466
1925-1929 ..	10	2,575	8,268,791	1,615,301
1930-1934 ..	3	960	2,240,438	359,056
1935-1939 ..	7	780	3,591,117	587,617
1940-1944 ..	2	840	3,861,368	1,034,116
1945-1949 ..	3	1,130	4,579,286	931,806
Total ..	50	8,950	32,513,283	7,651,139

Note.—In addition to the above 50 mines there are 8 other mines whose lives on present milling capacities exceed 38 years.

1249. The point that interests us is whether those figures indicate, in your judgment, further room for the introduction of machines?—Certainly.

1250. Large or small?—I think the smaller machines will increase more rapidly.

1251. Well, you have given us a very interesting forecast of further economies to be effected. Does that opinion of yours indicate that you think that the present labour force is not being employed to the best advantage, or not?—I will put it in this way, that the present labour force is being employed to the best advantage as far as the people who are using it know, but their knowledge and experience will increase in the future, undoubtedly.

1252. Are there very considerable further economies to be attained by further amalgamation or more unity of direction?—Well, amalgamations have already taken place to such an extent that there are not many more companies to be amalgamated in that way.

1253. You do not see any further progress in that direction?—There will probably be further amalgamations, of course, but not to the same extent as in the past.

1254. Is that one of the reasons for anticipating cheaper working costs?—Yes, slightly. I do not think amalgamations will contribute very largely to that any more.

1255. Have you any tables of the mines now producing, showing what proportion are making no profit or a very small one?—No, I have no direct returns. I do not get figures regarding costs.

1256. I think there has been a considerable reduction in railway rates, for instance, since Union came about?—Yes, but I am afraid I cannot give you an opinion.

1257. You cannot give us the effect of that upon the industry?—No.

1258. Now regarding the respective spheres of white and coloured labour. What are the Mining Regulations on that subject?—Well, it varies in the different Provinces. There is practically no colour bar in the Cape Province, but there is in the Transvaal and Free State. We consider that the native is practically incompetent to exercise certain functions for the purpose of providing for safety in mines. For example, he cannot hold any certificate of competency either as a mine manager or a mine overseer, or a mine surveyor or a mechanical engineer, or a winding-engine driver, or be the holder of a blasting certificate in the Transvaal.

1259. What is the reason for the divergence of practice in the Transvaal as compared with other parts of the Union?—It is a continuation of the policy that existed before Union came into force. There was no legal colour bar in the Cape.

1260. It is an accidental continuation of the previous order of things?—Yes.

1261. Is there any particular Government policy in regard to that?—No. The policy of the Government, I take it, at the time was to follow the line of least resistance and take things as they found them, until circumstances arose which would compel a change.

1262. And so far no change has occurred?—No; practically none yet.

1263. Now, the Economic Commission have drawn a great deal of attention to the subject of the extreme instability of white labour here. The white miners, particularly the underground men, shift about from one mine to another to an abnormal extent?—Yes.

1264. Can you give us any figures, or state your view, as to the causes of that instability?—The evidence of that Commission will, of course, indicate what figures I then placed before them. I could only give you the same figures now.

1265. That is practically up-to-date?—It was about two years ago. There may have been a slight improvement since then. Prominent attention has been drawn to the matter, and, possibly, the number of changes is not so great as before.

1266. You cannot say definitely whether any considerable improvement has taken place?—No.

1267. Can you give us your personal views as to the causes of what appears to be an abnormal condition of things?—Well, as far as the men themselves are concerned, it is partly due to the facility with which work can be obtained at one mine as compared with another. For instance, a man is dissatisfied with the conditions on one mine. He finds it is not very difficult to get a job at the next mine. The reasons for his dissatisfaction are numerous, naturally. One of them, no doubt, is the contract system. That is largely a cause of dissatisfaction—the continual hunting after the big cheque.

1268. That makes a man go from one mine to another?—Yes. And then, besides that, the miners, very largely, have no fixed homes. They have not got their own houses. If they had they would probably think twice before leaving a particular mine.

1269. Then, a large proportion of the miners roam up and down?—Yes, a very large number.

1270. Do you think that is conducive to efficiency?—No, certainly not.

1271. And you think the main reason of it is the contract system as applied to white labour?—Largely. I would not say it is the main reason, but it is one reason. Even on day's pay and bonus a similar thing takes place. It is the facility with which you can obtain work and the facility with which the management or mine overseers can obtain other workers. There is mutual dissatisfaction.

1272. I think the figures which were given before the Economic Commission were that more than 50 per cent. of the men had been at their present mine less than six months?—Yes. I have not seen it put in that form, but I think it is so.

1273. You have no detailed figures on that point?—No.

1274. Then, do you advocate the policy of day's pay with or without bonus in its present form?—I do not advocate it as a policy, legally or universally, but I advocate it being tried by the mines more largely. Some mines have tried it and some have found it unsuccessful, as a matter of fact. Of course, that is no proof that it is a bad system. Very often people try a system and they are prejudiced against it, and they cannot make a success of the new system.

1275. With regard to native labour, the Economic Commission also drew attention to the desirability of giving a greater incentive to good work by a bonus or contract. Have you any views on that subject?—Yes. I think efficiency would certainly be improved by offering an incentive. You heard what the system at Kimberley was. The white man is on day's pay and the native is on contract pay, very largely. They made that change some years ago, and they are entirely satisfied with it.

1276. You have had official experience of both systems?—Yes.

1277. Which do you consider the best?—I consider the Kimberley one the best.

1278. The Commission have read with interest the report by General Gorgas on the health conditions of the Rand. Have you any observations to make on that which you would like to put before the present Commission?—I think his most valuable suggestion was for spreading out the natives, instead of putting them in compounds in the way we do at present. There is no doubt that that would not only improve the health of the natives, which is the main point of Colonel Gorgas's recommendations, but I think it would also improve their efficiency. One would get a stable mining population here, as far as the natives are concerned. Inefficiency on the Rand is due to the fact, very largely, that the natives do not stay long enough. They only average seven or eight months. This also explains, very largely, I think, why accidents are so numerous on the Rand as compared with European countries.

1279. You mean the number of new hands?—Yes. The native is unable to look after his own safety in the same way as a European. He is dependent on the white miner who is in charge of a number of natives. There is no thought, individually, of looking after safety.

1280. Then, in your judgment the adoption of General Gorgas's recommendations would lead to improved health of the natives, improved efficiency, and a diminution of accidents?—Certainly.

1281. And by that you mean what—the adoption of the system of native locations or smaller compounds?—The adoption of the system of native locations. Of course, there are many other things to be considered. You have to bear in mind that there are very serious difficulties in the way of putting this into

practice. It may not be practicable on the Rand. For instance, it would mean that you would have a very large native population, not living as they do in their own country, but living very closely together. Questions of sanitation and control of illicit liquor, and matters of that kind, would become more difficult, of course, than they are at the present time.

1282. Would you say that the industrial efficiency of the native is increasing?—I think so.

1283. I suppose it is increasing more slowly owing to the short period he remains at work, is it not?—Yes.

1284. Have you, in your official capacity, knowledge of the difficulties regarding illicit liquor?—No; that is not a matter that comes within my jurisdiction.

1285. You cannot say whether that is improving or not?—I am not giving any evidence, but my opinion is that it is increasing.

1286. Owing to what?—I think owing principally to the profit to be made out of the business. And the difficulty of control, of course, is very great.

1287. And does it seriously harm both the health of the native and the industrial efficiency of the native?—Yes, I think it does as far as his efficiency is concerned. I do not know that in the short period that he remains at the mine much harm is caused to his health, but I think it interferes with his efficiency very largely.

1288. Can you make any suggestion to improve matters?—I am afraid I have not a sufficiently intimate knowledge of the matter to make any suggestions.

1289. Regarding the methods under which natives are now recruited, have you any views?—No. That is also a matter I am not directly connected with.

1290. Are there any other points on which you would like to be examined?—I think the Commission has already had figures from Mr. Warington Smyth in regard to the mining revenue.

1291–2. Yes, but they are somewhat incomplete. We should like to hear what proportion of the total revenue of the State proceeds from mining sources?—The direct revenue derived during the financial year 1912/13 was 2,359,263*l*. That is from all mines. This revenue is partly taxation. It is divided into three classes—where the Government is practically a partner, as in the case of the Premier Mine, licences and mynpacht dues, which may be considered in the way of rental, and other direct taxation on mining, such as the profits tax.

1293. Outside of that amount you have named, what other taxation does the mining industry bear?—There is no direct revenue from the mining industry besides that. Indirectly, of course, the country lives on the mining industry very largely.

1294. Can you give us the proportion?—It is impossible for me to make more than a guess at it.

1295. I have here a table which I will show you. It has been prepared after inquiry from various Government Departments. I shall be glad if you will take that and give us your observations. We think it important to have some idea, and we quite recognise the extreme difficulty of making a correct estimate. If you would perhaps consider that at your leisure and furnish us with any comments, we shall be much obliged?—Yes*. On the question of the iron resources of the Union, I think the Commission has had some information.

1296. Yes, but we should like to have your views?—I can refer the Commission to other sources of information contained in our publications, of which I have some copies here. I am sorry I have no spare copies. The matter was first dealt with in a memorandum of mine in 1909. Then there is a report from Mr. Harbord on the manufacture of iron and steel in the Transvaal, issued in 1910, and the Annual Report of the Mines Department for 1912; on page 175 there is a description of a very promising occurrence in the Transvaal at a place called Kromdraai. And in the Report for 1909/10, on page 73, there is a description of a number of other deposits in the country which are not so promising as that of Kromdraai.

1297. Will you give us the documents?—I am afraid I cannot give them to the Commission, as they are the only copies I have.

1298. We will give you them back. Now, with regard to coal: You have already given us a reference to the latest information on the subject?—Yes.

1299. Have you anything to add verbally to that as far as the coal resources are concerned?—No. Our knowledge of the subject has not increased since those figures were issued. At the present time I may point out that the coal exploited is naturally near the railways. It does not pay for long branch lines to be constructed to outlying parts. You may have heard in Natal, possibly, that coal is getting scarce, but that means coal in the neighbourhood of the railways.

1300. Not that the field is becoming exhausted?—No, I do not think so.

1301. Have you considered the question of the export of South African coal to oversea ports or its use for bunkering purposes, and the possibilities of development in the trade with India?—Yes; there are very great possibilities, but, of course, we have to compete there with European coal and Indian coal, and it is a question of price very largely.

1302. Now with regard to diamonds, we had evidence both at De Beers and the Premier Mine that, in the opinion of the Companies, those deposits are almost unlimited in life?—Practically.

1303. Now what is your view as to the impoverishment in depth at De Beers or the Premier?—In both cases, I think, there is an impoverishment in depth.

1304. Proceeding at what rate?—I am afraid I have not the evidence available at the moment.

1305. But no such impoverishment as would go near the margin of payability?—No. Of course, the mines at Kimberley earn very high profits. The Premier Mine is not so profitable. In the case of a fall in diamonds, such as we had some years ago, the margin becomes very small, and if the value of stones should again fall the profit would go down. But at present the profit is fairly reasonable.

1306. Therefore, it is essential really for the price of diamonds to remain above a certain level?—Yes.

1307. Then, to remain a payable proposition, the price of the output would have to be increased as the richness diminished in depth?—Yes.

1308. **(Sir Alfred Bateman.)** Could you tell the Commission what powers you have to collect these statistics?—I have powers under the Mines and Works Regulations Act to compel the production of statistics by managers of mines.

1309. Are you the judge as to what statistics shall be furnished?—Yes. Of course, there is always an appeal to the Minister in case I exceed my powers, and if I start collecting too many statistics there is a great outcry.

1310. As a matter of fact, is there any opposition?—Now and then there is, more particularly from small mine owners. The large companies rarely offer any objection.

1311. Have you compulsory powers. Can you haul them before the magistrate?—Yes.

1312. What is the penalty?—The penalty under the Regulations is up to 150*l*. for one offence.

1313. And you can prosecute them again and again?—Yes. I do not think we have had a prosecution for years. We generally find a little pressure or a threat is sufficient in the case of one who does not wish to comply.

1314. Compared with other Departments in South Africa you are rather favoured in having compulsory powers to collect statistics. Statistics are not obtainable by law in any other branch, except the Customs?—That is so.

1315. Can you state the grounds of your estimate that the untouched mines had a potential yield in tons equal to the mines now working—something like 587 millions tons?—The figure is based on what we know of the mines already working, and extending that knowledge to the unworked areas. Of course, one has to be very careful to extend the calculations to areas which are situated, in some cases, miles away from any working mines, and one has to put a large discount factor on it. I think I should indicate that on the Eastern area I take my limit as 5,000 feet, and on the remaining area at 7,500 feet.

1316. And, generally speaking, you are working from the known to the unknown?—Yes. I have divided the Rand into six sections and taken each separately. I take the Far East section. The Chamber of Mines gave the figure as 86,000 claims. I put it at 91,000 claims.

* Mr. Kotze subsequently stated that he had no serious criticism to offer on the estimate in question. A copy of the table appears in Appendix XIII., p. 117.

I allow a final payability of 30 per cent.—and so on with the other areas. The total area is 113,881 claims, according to my estimate.

1317. Of which you say 86,000 are payable?—I say 31,379 claims is the net area payable. We make allowances for faults, pillars, and dykes, and also an allowance for the unpayable area.

1318. And what result do you arrive at?—The final figure, as far as tons are concerned, is rather more than 600 million tons. I must emphasise again that such an estimate is, in a manner of speaking, an abuse of arithmetic. It is very easy to add and multiply and divide, but if the factors are uncertain your superstructure is also uncertain, and the factors in this case are very uncertain.

1319. Have any estimates been made by other authorities?—Yes, about half-a-dozen.

1320. Are they somewhere near your figures?—No; the variation is very considerable.

1321. Can you give the extremes?—I am afraid I have not them available at the moment. The last authoritative estimate was made, I believe, by Mr. Hatch and Mr. Legat about eight or nine years ago. They arrived at a figure of about 1,300,000,000*l.* to be extracted, and the figure I arrive at is rather larger.

1322. I think you told us that every ten years adds considerably to your knowledge?—Yes, in fact every year.

1323. You spoke about the existing system of payment by contract. Has it ever been considered whether any system of co-partnership or profit-sharing could be applied in the case of these mines—as is done in connection with the London gas companies, for instance?—I do not think anybody has ever given the matter detailed examination and consideration.

1324. You have never considered it?—I have thought of it, but I have never gone into the matter carefully.

1325. You think it would be desirable if it could be done?—Well, it has many points in its favour.

1326. But you have never discussed it with your Ministers?—No.

1327. You spoke about the difficulty of keeping liquor away from the natives. Is it not a fact that seven years ago, when I was here, the Portuguese natives used to have wine supplied to them?—Yes, in their own country.

1328. A bottle of Portuguese hock used to be supplied?—Not here.

1329. Wine is easily obtainable there?—There is no restriction.

1330. We were told it was encouraged by the Portuguese authorities because it assisted the wine industry in Portugal. Is there provision now with regard to Portuguese natives to the effect that they shall have Portuguese wine while they are here?—No.

1331. They are in the same condition as your other natives?—Yes. The sale of intoxicating liquor to natives is prohibited.

1332. I think I understood you to say you were in favour of one of these recommendations of General Gorgas about the families of natives?—I would like to see it tried. I will not say I am entirely in favour of it, because of the difficulties that I have enumerated, such as the control of illicit liquor and the matter of sanitation, and so on. There are many other questions to be considered. It is not a simple question at all.

1333. Has it been tried?—No, not on the Rand.

1334. **(Mr. Campbell.)** The proportion of whites to blacks, in the report of the Chamber of Mines, is given as one to eight. Does that proportion hold for underground work among those employed in mining, or is there a larger proportion of blacks to whites employed underground?—Yes. It is a little higher.

1335. Well, in this report the costs of mining are given for an average mine on the Rand and for average mines in Western Australia, and the figures show that the mining costs in Western Australia—where white labour is employed altogether—are considerably lower than here. What is the reason of that higher cost on the Rand, where labour is so much cheaper?—Of course, in regard to natives they are cheaper than white men, but the white man, on the average, can do more.

1336. There is a very large proportion of natives employed—ten to one, is it not?—Yes. And then the efficiency question comes in. The efficiency of the white men in Australia is higher than in the mines here; and, in the next place, there is the question of the nature of the ore deposits. This is more favourable for cheap exploitation in Australia generally than it is here. We also have mines where we have a very wide body of ore which runs very low in value. Take the Knight's Deep, for instance. The costs are only about 10*s.* to 11*s.*, as compared with an average of 18*s.* for the whole Rand.

1337. Generally speaking, you work a very large body of homogeneous ore, and the costs of mining must be rather in favour of the Rand?—You are speaking of a large body, but that is not what I mean. Our reefs are narrow, compared with those of Australia, and flatter. In that country they are pretty well all vertical deposits which are wide, and they lend themselves to cheaper exploitation.

1338. Does that make a very considerable handicap on the Rand?—Yes.

1339. But, generally speaking, you would say, too, that white labour here is less efficient than in the mines of Western Australia?—Yes, white labour is less efficient, and coloured labour very much less efficient.

1340. In reply to the Chairman, you gave as one of the causes, I think—if not the only cause besides inefficiency—the contract system, which sends men from one mine to another?—Yes.

1341. You gave as the reason for the comparative inefficiency of white labour here the contract system?—No. My reply regarding the contract system related, I think, to the frequent changes which take place as being one of the reasons for the inefficiency, and I said that these changes were often due to dissatisfaction in connection with contracts.

1342. And you gave it also as a reason for the inefficiency of the labour, I think?—No, I do not think so.

1343. Well, what is the reason for the inefficiency of the white labour here?—The inefficiency is due, in the first place, to the fact that the miner is not so good as he is abroad.

1344. Why is he not?—Let me make it clear. In many instances the miner in this country does not do the same work as he does in Australia or in Europe.

1345. But the climate is the same?—Yes, but he is an overseer here and a miner over there. He only superintends labour here; he does not do any actual work.

1346. That brings it down to the fact that it is black labour that is employed in actual mining, and white labour only in supervision?—Precisely.

1347. That seems to come back to the fact that black labour is altogether inefficient as compared with white labour?—Yes. But I want to make that point clear, that the white man is very largely an overseer in this country: and, in the second place, I want to say that the miner, as a miner, is inferior to the Australian miner, for the same reason that he does not do the work here, and he has not the same chance of learning the work. The method of training a miner locally is not the same as in the rest of the world. He does not learn the work as he does in other countries.

1348. Does not that line of argument rather bring you round to the conclusion that the employment of white labour altogether in mining would be cheaper than the employment of black labour?—If your conditions were changed. If you could take our mines in a balloon to California or Australia you could work much more cheaply than we do probably. But we have our conditions, and we have a certain class of white man with a certain standard of living, and black labour working, too. Their efficiency and pay are low. And those are our conditions.

1349. With the entire employment of white labour, do you not think that the conditions here would approximate to Australia?—No, you cannot get rid of the conditions. We have the black labour. The white man lives among the blacks and he has a standard of living which is quite different and probably higher than in Australia. You can assume certain things, of course, but that is only an academic discussion. You cannot alter the conditions in this country so rapidly. If the number of payable mines increased largely and they were very profitable—and we do not get enough coloured labour in the country—it is possible that by

force of circumstances the mineowners would be compelled to employ white labour more largely.

1350. There is not much likelihood of that is there—the tendency is all the other way?—At the present time, yes.

1351. Now do you think that the white man's inefficiency here is in some way due to the extra danger to life by reason of the disease and accident on the Rand, as compared with elsewhere?—No, I rather put it down to miners' phthisis—an industrial disease. It is a fact that it has encroached on the number of miners. If the miner has only an average life of ten years, instead of having an experienced man of twenty years you are going to have a new miner of say only five years' experience. He cannot be so good, naturally. For the last two years we have been carrying on a very extensive campaign against phthisis, and we are gradually altering those conditions.

1352. And you think that with improved conditions efficiency will increase?—Yes, and I think that a little more care should be taken of the training of our white miners. They are being recruited more and more from South Africans, and unless greater care is taken in training the worker to efficiency, they have not much chance of improving. We have about fifty boys at one mine learning, and we train them as boys are trained in other parts of the world: they do the work the same as kaffirs in order to learn it thoroughly.

1353. Is technical instruction available here of a very high order in connection with mining?—We have the Mining School, where we train them to do the ordinary work of a miner.

1354. Is it efficient?—Yes, I think so.

1355. Are the men who go through the School of Mines fitted to take positions elsewhere?—You are, I presume, now speaking of the School of Mines. That is an engineering institution. I was rather talking about the Miners' Training School—that is a different institution.

1356. Men can move away from here who have been trained in the School of Mines and take responsible positions?—Yes.

1357. In reply to the Chairman—I did not quite understand the answer you gave. Speaking of the estimated life of the Rand you said the reserves of ore would yield as much ore as the present producing mines. Did you refer to the proved resources of ore in producing mines?—No, I did not say as much as already produced. The position is this. We take the producing mines and estimate the tonnage still to be mined in those mines. That is an estimate that is also based on certain factors which we have, and we estimate a certain tonnage is to be drawn from those mines still. That is 587,000,000.

1358. It was that ore you were referring to?—Yes. And there are certain other areas which do not belong to existing producing mines which will in future, and from those we expect a certain further tonnage.

1359. And you expect that the untested reserves will yield as much as the mines already being exploited?—Yes, I think so.

1360. **(Chairman.)** What is the total amount mined up to now?—I can supply you with the figure later.*

1361. **(Mr. Lorimer.)** Does your Department interest itself only in mines in actual operation, or does it take cognizance of known deposits of minerals which have not been developed?—We take cognizance, but naturally we do not pay as much attention to those as to those which are being exploited.

1362. If we wanted the fullest information that can be had on the subject, to whom should we refer? Would the Chief of the Geological Survey be the proper party, or have you any information?—Which mineral are you referring to particularly?

1363. Well you have so dazzled us with the enormous wealth of your gold and diamonds that we are apt to forget that you have anything else of consequence. In travelling through the country I have heard from time to time a good deal about coal and iron and copper along with other minerals. I should like to ask one or two questions about these. I notice in this book that the estimate of the coal in South Africa amounts to something like between 40 and 50 thousand million tons. Now, by whom were those figures prepared?—By my Department, partly by myself and officers under me, and partly by the Geological Survey.

1364. And the Heads of the Department regard them as reliable, I suppose, or they would not be furnished?—Precisely. You will find in the report to what extent they can be considered reliable. They are not absolutely reliable, of course.

1365. But approximately so. I notice you gave figures of the grand total: do you know how this total is distributed over the different Provinces?—Yes. In the second volume of this publication, on page 411, there is a detailed estimate showing the various Provinces.

1366. We can get it there?—Yes.

1367. Then in regard to iron: you appear to have iron everywhere—in all the Provinces except the Orange Free State. There appears to be enormous quantities in the Transvaal and in the Western Province, some of inferior quality and some of very high quality?—Yes.

1368. Have you any general statement prepared as to the actual quantities of that, the same as you have of coal?—No, for the simple reason that the deposits have never been opened up.

1369. I was talking to one man about a large deposit near Prieska, and he seemed to think that the Government knew little or nothing about it?—It was only recently discovered, and the Government has not made any very careful investigation about it yet.

1370. In the pamphlet as to iron which you have sent in, I notice that the writer—Mr. Harbord—speaks of the extreme difficulty of finding a market for your finished products in this country, and he quite well understands that to convert your ore into the ultimate product—the finest forms of steel—would involve an expenditure on plant for which you are not likely to get any return at all. Now, has it ever been discussed among you—have you ever given any consideration to putting up blast furnaces and making pig iron, and shipping it to Europe?—Yes, there are parties who have given the matter consideration, but it has never gone any further than discussion.

1371. What would be your difficulty about that? What is in my mind is this. The iron would be very very cheap to produce on account of the supply of coal here, which is cheap. I do not know whether you have dolomite or limestone in proximity to these fields or not, but, supposing you had, you would get very cheap railway freights, and I imagine you could send that as sponge or pig iron to Europe at a price that would pay very well. Nobody has gone into it?—Yes, but never to the extent of putting up the money.

1372. About the copper: I have heard about the Cape Copper Company and the Namaqua Copper Company in the same district, and I have had a pamphlet about the Messina Company. Are there any others in South Africa?—No, those are the only producing copper mines at the present time.

1373. The Messina seems to be going ahead fast?—Yes, it is.

1374. I noticed in your paper that you have in the Transvaal in the year 1911, two thousand tons of copper shipped, and now you are producing at the rate of 1,500 tons a month; is that on account of the Messina production?—Yes. Those figures are Messina entirely.

1375. There is no such increase in other mines?—The figures you have are for the Transvaal only, I think.

1376. In what shape is that copper sold; do they make a matte of it?—The copper at Messina is sold partly as mineral and is shipped direct as approximately 50 per cent. copper.

1377. After passing through one furnace? No. This is simply mineral ore. The rich ore is shipped direct and the poorer ore is concentrated into a matte in the furnaces.

1378. You have no silver?—No, except what is found in with the gold on the Rand, principally.

1379. What about tin?—The production is given in the table before you.

1380. 3,600 tons in the course of the year. Are the mines alluvial?—Not alluvial in the Transvaal, as a rule. Alluvial tin is won in Swaziland and in the Cape, but not in the Transvaal.

* *See* Question 1489, p. 50.

1381. Are there large quantities of tin?—Yes.

1382. And lead?—Yes, we have some lead in the Western Transvaal and in the neighbourhood of Pretoria.

1383. Is it being worked?—To a small extent. I do not think the production recently has been of any note at all.

1384. You have no such deposits as will rival Broken Hill?—No, nothing like it.

1385. Of the lesser metals you have an increasing quantity?—Yes.

1386. You have asbestos, graphite, manganese, and zinc?—Yes. We have also promising deposits of zinc which will probably be worked in the future to a considerable extent.

1387. Where?—In the Western Transvaal.

1388. Which have not been largely developed?—Yes, but the plant is not yet erected for concentration.

1389. If I might refer for a moment to the coal: you have here the relative percentage of waste in each of the four Provinces. The waste in the Natal coal is enormous as compared with the others. Is it due to the quality or the method of working?—The waste is largely fine coal—duff. Some years ago the duff was not burned at all. It was about 30 per cent. But now the large power companies, such as the Victoria Falls and other power-producing corporations, burn it, and there is less waste.

1390. Another point that struck me was this: I see the value of Cape coal at the pit's mouth is twice what Natal is?—Yes.

1391. Is it better quality?—No. It is poorer. But it is less inaccessible, and the others cannot compete with it.

1392. I want to refer to an answer you gave to another gentleman. I gathered that you said, in respect of the mines, you would like to see the contract system superseded for the white men and day's wages for the coloured men; is that it?—No. Day's pay for the white men and the contract system for the coloured men.

1393. Is not the white man on day's pay now?—No, very largely on contract.

1394. Then if he is simply a supervisor, how do you arrange the contract?—The basis is that he gets so much per fathom of ground broken, and from that is deducted the cost of his stores and the wages of his natives.

1395. You say the industrial efficiency of the native is increasing. Do you find great variations in the intelligence of these men?—Yes. Some are extremely intelligent; as much so as the white men.

1396. Some would do as good work as the white men if they were allowed?—I think so, with training and education.

1397. **(Mr. Sinclair.)** When you gave us a rough comparison of what could be produced by future mines, was that estimate based on any boring operations or examination of the untouched ground?—No. The boring indications would only give the depth of the reef.

1398. Some have taken place?—Yes, and we can estimate the approximate depth at which the reef lies in those various areas. But they give very little indication as to value.

1399. Is there any considerable variation in the grades of richness of the ore?—Certainly, from non-payable up to very profitable ore.

1400. And do you take an average in estimating as to the unknown?—Yes. I take an area and allow a certain percentage for unpayable ore. Take a large area of, say, 5,000 claims, well, from the information at my disposal I might consider only 30 per cent. of the ore in that block would be payable.

1401. Is it possible that one of the advances of the future will be the working of grades that are not at present payable?—Certainly.

1402. That, then, is one direction in which you think there may be considerable development?—Yes. On account of the reduction in cost.

1403. You were asked a question on the subject of profit sharing. That would be rather complicated in South Africa, would it not, by the fact that a large part of the work itself is done by coloured labour?—You need not have a profit-sharing system with your natives.

1404. That would involve excluding those who do the actual work?—As far as the system is concerned. Of course, you could have the system the other way.

1405. It would complicate the introduction of such a system?—Yes, and it would be still further complicated by the fact that the white men change so rapidly.

1406. White miners who are being trained to do the actual work at the mining schools, what do they do when they leave? Do they do the actual work then?—No, they are overseers in the same way as the others.

1407. But they have had the advantage of being trained in the knowledge of how to do the work itself?—Precisely.

1408. As regards the future of the industry, have you assumed that the wages will remain as they are now?—Yes.

1409. A question or two on the subject of the instability of white labour. Did I understand you to suggest that their not having homes in any particular locality conduced to workers moving about?—I think so.

1410. Has anything been done by the mines to encourage workers to establish homes and to help them to do so by advances?—Yes. Many mines have built cottages for married people; in fact, most of them, and they let them at low rentals.

1411. Which includes a sinking fund, perhaps?—No, it is not the hire purchase system.

1412. Are they entitled to acquire them?—No, but recently one mine has projected such a scheme. It has been taken up to some extent.

1413. Is it a system by which the payments will in time wipe out the purchase cost?—Yes.

1414. I would suggest that, in other directions which I have in mind, that system has worked exceedingly well, and has resulted in time of trouble in those who have acquired homes being less inclined to leave the place and move away?—I think it must have that effect, naturally

1415. One of the causes which you suggested for moving about was their eagerness to take up contracts. Is the contract system of labour by white men encouraged or discouraged by the trades unions in South Africa?—The contract system is discouraged officially by the trade unions.

1416. You referred to the report of General Gorgas, in which he advocates spreading out the natives; would that not involve very large numbers of the natives settling down in spots adjacent to the mines?—Precisely; they would become permanent inhabitants on the Rand.

1417. Is there not objection to the congregation so near a large town of such a multitude of native people?—I have already indicated a number of objections to it; especially in regard to liquor and sanitation.

1418. You know the conditions under which the natives are located at Kimberley, for instance?—Yes.

1419. Where they remain in the locations for a certain fixed time. Do you think that the surroundings under those conditions are less healthy and tend less to prolong life than in the normal conditions outside?—No, I do not think there is any influence on their life, except in so far as they may be subject to diseases like pneumonia, and other diseases due to overcrowding.

1420. And do you think that they are as well placed as if they were spread out in the locality of Kimberley, for instance?—No, I think if they were spread out—not in the town, but outside—and living with their families, their health would be better.

1421. You think then that, favourable as the conditions are under which they are located, they would be still more favourable provided they were living in the outskirts outside the town?—Yes.

1422. You have not spoken, and you do not propose to speak, I gather, of disease in mines, do you?—As far as disease is concerned—miners' phthisis is the principal one, and I have an intimate acquaintance with that subject if you wish to question me.

1423. I do not want to question you in detail, but are there any suggestions that you think would be helpful to the Commission in the direction of minimising the number of deaths from disease?—Of course, I could give you the particular methods which we are

enforcing now for the prevention of miners' phthisis.

1424. By the Government?—Yes.

1425. It would be interesting to hear that.—The method of preventing miners' phthisis is shortly that of reducing the dust in the mines by the application of water, making the mines as wet as possible.

1426. The two chief menaces to the health of miners are dust and the gases brought about by the explosions?—Yes.

1427. As regards dust, that can only be materially diminished by systematic spraying?—Yes, the application of water.

1428. And I take it that it would come within the functions of the department that you control to examine and supervise as to the sufficiency of the efforts that are made to minimise that evil?—Yes.

1429. And is it your opinion that all that should be done is being done?—All that we know is being done to a certain extent. Of course you must allow for the natural tendency of human nature. There is a sort of average inefficiency. Some people are anxious to do all they can, and even more than the law lays down, and some have to be forced.

1430. Then you look in the future to developments or discoveries which will, it is to be hoped, still further reduce the death-rate?—Yes.

1431. As regards gases that are produced by explosions; are they looked after, and is everything done to minimise the evil?—Yes, after blasting has taken place the fumes are dissipated as rapidly as possible, in some mines artificially and in others naturally.

1432. Has artificial ventilation to be adopted very largely in the mines in this locality?—Yes. And it will have to be adopted to a still larger extent in the future as the mines get deeper.

1433. Is any substantial proportion of the disease that seems to be inseparable within certain limits, from these mining operations, brought about by the use of water that is impure?—We have no indication yet.

1434. That is a phase of the evil, I take it, that is being investigated?—Causing what diseases?

1435. What I had particularly in my mind was the using of the same drinking vessel, indiscriminately, by all and sundry in the mines. Is it a part of the system of control to try to make provision for preventing that?—No, there is very little done in that way.

1436. But that is a direction in which there is scope for advance?—Yes, I think there is, if that is a fruitful source of infection.

1437. I gather from the report of General Gorgas that it is suggested as a source of infection, and with that knowledge, I take it, everything that can be done will be done to minimise the evil?—Yes.

1438. **(Sir Jan Langerman.)** Do you consider that the amalgamations that have been brought about in the past have been conducive to the benefit of the country, the shareholder, and the worker?—Yes, I think many of the amalgamations have been conducive to good results.

1439. Do you think if that system of amalgamation were extended it would have the same results?—In some cases I am not quite so sure that continued amalgamation would improve the conditions.

1440. What would be the difference? If the smaller ones are good, surely the larger ones would not greatly militate against it being desirable?—The control of a very large property becomes more difficult the larger it is. The management of an exceptionally large administration means exceptional ability. It is difficult to find gentlemen with such exceptional ability. They do not walk about with labels on their backs.

1441. They have been found for the existing amalgamations?—Let us hope that they are satisfied with them.

1442. Supposing that the whole Rand were to be amalgamated, would there be any advantage in it for the country, the worker, and the shareholder?—If the whole Rand were amalgamated the advantage to the shareholder would be very great, I think.

1443. To the country?—It might help the country.

1444. To the worker?—I think there would be, on the whole, a better and more contented body of workmen.

1445. So that, in your opinion, there should not be very much objection if it could be carried out, and the geniuses you refer to could be found?—From an engineering point of view there would be no objections. From the political point of view there might.

1446. You based your idea of the increase in native efficiency on the larger number of tons hoisted in relation to the natives employed on the mines. Is that a fair basis?—No. It is not, because the tonnage is more largely broken by machines to-day than years ago, and, consequently, the tonnage must go up per native. But it indicates that the native as a unit is doing more work than before, owing to mechanical assistance.

1447. Not by actual rock broken himself?—No.

1448. Have you any data in regard to his efficiency in regard to actual hand labour?—No.

1449. So one cannot say, in regard to actual experience, that he has increased in efficiency?—You may be able to get some evidence. I have none.

1450. You could not give us the percentage of stope drills and development drills?—No.

1451. Now, on several mines, to your knowledge, we are simply working at a loss. Now, the country is largely interested in those mines. Should it not be the duty of the State Mining Engineer to point out to the Government, in regard to those assets of the State, that their profits are being depleted unnecessarily, and those mines should be stopped and only allowed to work during such time as a profit could be shown?—The State cannot prevent any mine owner from working his mine at a loss.

1452. But the State is a partner surely, and it is losing by an unpayable mine working?—In what way?

1453. In regard to the Profits Tax, for instance?—If you stopped the mine the State would not only get no Profits Tax, but it would also lose because the mine would shut down.

1454. But it could be worked later on?—It might be.

1455. It is no loss then, really?—I consider it would be a false step for the State to step in and say that because a mine is working at a loss it should close down.

1456. Although you see before your eyes the assets of the State being depleted and the country getting poorer?—I do not see that the assets of the State are being depleted to the disadvantage of the State.

1457. Does the State draw a benefit?—Yes, money is circulated by the working of the mine.

1458. There is an indirect benefit, then?—Yes, which is far greater than the benefit derivable from the Profits Tax, in my opinion.

1459. Now, in regard to advocating that the natives' wives should come here, do you think there is room to place 250,000 wives and children in the neighbourhood of the mines? Do you think it practicable?—There is room if you want it—there is the whole veldt.

1460. You appreciate the fact that it would mean the natives in the immediate neighbourhood of the mines?—Yes. It depends on the definition of the term "room."

1461. You would have to give the kaffir his ploughing land and grazing?—It depends on how large a piece you mean to give him.

1462. Do you think the finding of room in the immediate neighbourhood of the mines would be any objection to getting the natives' wives and children there?—I do not say all of them. After all, the project would not be to find room for 250,000 at once.

1463. We have a considerable amount of room and could put a large number here?—How large a number I would not like to say.

1464. Do you think it would be a benefit to the white population to have these multitudes of natives round the town?—That is a very wide question. I am not prepared to give an opinion directly.

1465. You told us that white labour was inefficient and black labour was very inefficient. Now there is a difficulty in bringing the efficiency of the white labour up because the white man has no means of learning his trade. Now would not that be a reason, then, for the black labourer being encouraged to be a skilled workman and this colour bar being removed?—Yes, I think that would increase the efficiency of the worker in that way.

1466. Because his inefficiency to-day is due to his inability to rise in his profession, the black man is kept down?—Partly, but I think more largely to the fact that he only stays a short period.

1467. But if he could rise in his work, do you not think it would encourage him to remain longer on the mine?—I think it would, in the case of a few natives, but not in the case of the bulk.

1468. I am not speaking of the 250,000, but if one per cent. took the place of the white people, it would be to the advantage of the Rand?—It would lead to more economical working if you could get a small percentage of the natives to do the work as efficiently as white men. I think the percentage, however, would be very small.

1469. It would be of advantage if the native were encouraged to rise in his profession and to give him more stability here and induce him to remain longer on the mine?—Advantage to whom?

1470. To the mines and the natives, too.—It may not be to the advantage of the country.

1471. In what way?—It is a very controversial subject. It is the much vexed question of white and black labour, which has been argued for years past.

1472. But we are talking economically, which is the best for the shareholder and the country?—From the economic point of view I can give you immediate information. It would be to the advantage of the industry.

1473. But from the country's point of view, would it be to the advantage of the country to import white labour when we have black labour on the spot? Must we not recognise that?—It might be to the advantage of the country; I do not know.

1474. How long does it take a man to get a blasting certificate?—About eight months at the present time.

1475. What is the average time in Europe for a man to learn his trade as a miner?—I think from three to five years.

1476. And here a man gets his certificate in eight months, and then he is a full-fledged miner to all intents and purposes?—Yes.

1477. Do you not think in giving him that certificate you contribute to the inefficiency of the miner?—Well, if we made it longer, in what way would it contribute to his efficiency?

1478. Surely you know a man cannot be a qualified miner in eight months, and yet you grant him a certificate?—In the first place, a blasting certificate is no guarantee as to the efficiency of a miner. It simply permits him to do certain work for safety. Whether he has a blasting certificate after he has been working for eight months or not, it makes no difference. He goes on gathering experience.

1479. But that certificate is taken by the mines and is accepted as a Government guarantee that he is qualified.—I do not think it is.

1480. But do you not advocate that no man should get a blasting certificate unless he has been working underground for a certain period, say, two or three years?—If you did that there would be a shortage on the mines and they would soon start raising objections probably.

1481. Then you think it would be a good thing to go in for importing competent white miners?—Yes, I think the mines would benefit.

1482. That would be brought about if the Government Mining Engineer withheld blasting certificates for two years, would it not?—It might, but you would perhaps find your contract rates would go up to an unknown figure.

1483. You spoke about the health conditions of natives in the different compounds. When you compare the health conditions of the natives in the different compounds here with the closed compound system at Kimberley, I take it you are in favour of the open compound?—No. I was in favour of spreading out the natives, as advocated by General Gorgas, to the present system, whether in Kimberley or here. I do not think there is any difference between Kimberley and Johannesburg from a health point of view.

1484. You do not think it would add to the health of the native when he is in a closed compound and gets no liquor and is not brought into contact with different vices? Don't you think the locked-up man would be much healthier than the man who is allowed to roam about?—Possibly, but I do not think it makes much difference.

1485. **(Mr. Bowring.)** I think you told us that the average value of gold recovered on the Rand is 18*s.*?—No.; that is the average cost per ton.

1486. What is the average value recovered?—I think it is about 28*s.* at the present time.

1487. What is the lowest value at which it can be worked profitably?—We have a mine working at a cost of something about 10*s.* 9*d.* or 11*s.* a ton.

1488. And is it paying a dividend?—Yes.

1489. **(Chairman.)** You will send a return of the tons which have been mined?—Yes.*

1490. You said there was an increase in the proportion of South African white miners. Could you give us particulars?—Yes, it is indicated in the last Blue Book.†

1491. I have only one further question. It has been stated that the Mining Regulations are so minute that they somewhat harass and embarrass the industry. What do you say?—It depends on what you call harass. All laws harass the citizen. But if those laws are for our benefit we should not look upon them as harassing us, but observe them. I think that they do add to the cost of mining, to a certain extent, but it is necessary for the purposes of safety. It is the duty of the State to see that reasonable safety is secured.

1492. You do not think they go beyond the necessary line?—No; I do not think they do. For instance, they are not as numerous as similar regulations in most other civilized countries. The German, French, and Australian regulations are far more numerous, and I think even the British ones are too, when you come to look at the special rules which are issued, because in British mines the safety is very largely regulated by special rules issued by the mines, and these special rules for particular mines are considerably more numerous than our regulations, although ours appear to be more numerous because they are contained in one volume, and every miner has to find out those which are applicable to him.

* The witness subsequently stated that the total tonnage of ore raised in the Witwatersrand up to the end of 1913 was 230 million tons, and the amount of gold produced was 90 million fine ozs., valued at £383 millions.

† Page 93 of the Annual Report of the Mines Department of the Union of South Africa for the year ended December 31, 1912 (U.G. 30-1913). The figures there given show that the number of white mine employees in South Africa, who were born in the United Kingdom, decreased by 4 per cent. in 1911 and by 3 per cent. in 1912, whilst those born in South Africa increased by 10 per cent. in 1911 and by 5 per cent. in 1912.

Mr. C. W. Villiers, Mr. B. G. Lloyd, and Mr. Henry Melville Taberer, J.P., representing the Native Recruiting Corporation, Ltd., and the Witwatersrand Native Labour Association, Ltd., called and examined

1493. **(Chairman.)** You have been good enough to prepare a short statement regarding native labour. Would you kindly read it?—**(Mr. Villiers.)** Yes.

The following statement by the Witwatersrand Native Labour Association and the Native Recruiting Corporation *re* Native Labour was read by the witness.

(1) *Recruiting of Natives.*

Natives for the mines are obtained in the following ways:—

(1) Natives from Portuguese territory are recruited by the Witwatersrand Native Labour Association;
(2) Natives from British South Africa are recruited by the Native Recruiting Corporation;
(3) Independent labour contractors;
(4) Local natives;
(5) Voluntary natives.

With reference to the Witwatersrand Native Labour Association, all the gold mines in the Witwatersrand area are members, also the collieries of

the Transvaal and Free State, and the Premier Diamond Mining Company.

The Native Recruiting Corporation recruit natives from British South Africa south of lat. 22° S. for about 85 per cent. of the gold mines of the Witwatersrand, the other gold mining companies making their own arrangements through independent labour contractors.

Both the Witwatersrand Native Labour Association and the Native Recruiting Corporation have agents through the territories in which they operate to recruit and forward natives.

Local Natives.—These are natives who change from one mine to another during their stay on the Rand, and those who have originally taken up work outside of the mines and who transfer to mine service.

Voluntary Natives.—A considerable number of natives come direct to the mines from their homes unassisted by any recruiting agency.

(2) *Medical Examination.*

The natives are medically examined before leaving their homes, and are again examined in Johannesburg, in the case of Portuguese natives, by the medical officer attached to the Chamber of Mines, and, in the case of British South African natives, by a Government medical officer. A further examination of the natives is made by the mine medical officers on their arrival on the mines.

(3) *Compound Management.*

Compound managers are licensed by the Government, and are responsible for the housing, feeding, and general well-being of the native labourers.

(4) *Duration of Contract.*

Natives recruited from Portuguese territories are registered to work for a period of one year. Natives recruited in British South Africa are registered to work for periods of from three to twelve months, the majority being registered for periods of six months. Voluntary and local natives engage themselves for periods of from one to twelve months. The majority of these natives engage for one or three months.

(5) *Re-engagements.*

A native who, at the expiration of his contract, wishes to continue working on a mine can re-engage for any period he likes, usually from month to month —or he may elect to leave the mine and find work on another mine, engaging himself for any period he likes up to twelve months.

1494. It is somewhat difficult to understand the precise spheres of the two corporations which you represent. Can you put it in simple language and explain the reason for these two bodies?—Yes. The Witwatersrand Native Labour Association confines its operations only to Portuguese territories and the Native Recruiting Corporation entirely to British South African territories for about 85 per cent. of the industry.

1495. Then the two do not compete with one another in any specified area?—No, not at all.

1496. The Witwatersrand Native Labour Association works outside the Union and the other organisation inside it. Is that it?—Yes.

1497. And the one serves the whole industry and the other serves 85 per cent?—Yes.

1498. And it competes in the Union of South Africa with the remaining 15 per cent.?—Yes, that is so.

1499. Now can you give the Commission the total cost of recruiting for the whole industry?—Yes, about 650,000*l.* per annum.

1500. Does that include everything? The figure stated before the Economic Commission, I think, was one million?—I think that is too high. That includes the cost of obtaining native labour for the mines. It is nothing to do with compound management or feeding.

1501. Does it include the cost of transport to and from native territories, and so forth?—In the case of Portuguese natives it includes the cost, but in the case of British South African natives, or the majority of them, they pay their own costs of transport.

1502. The native pays it out of his wages?—That is so.

1503. Then can you give us the details of that 650,000*l.*? What does the money go in?—In paying agents to recruit the natives, in paying our staffs, and to look after the natives when they are recruited.

1504. Can you give approximately the figures for each of those heads?—I cannot give them offhand.*

1505. Because the figure at first sight appears large? It is certainly very expensive.

1506. If you take it as the proportion of the cost of intermediaries to the ultimate cost of the labour—the amount coming to the individual worker—it represents a very high proportion, does it not?—It is very high.

1507. Do you know of any other industry where the cost of the intermediary represents so large a proportion of the total amount coming to the labourer?—No, and I know of no other industry which has the same difficulty in obtaining its labour supply.

1508. Is that proportion of cost increasing or diminishing?—It is diminishing slightly.

1509. Not largely?—Not largely at the present time.

1510. Could you tell the Commission in what precise way your agents in the native districts and territories work? What is the normal operation that they carry on?—As regards the British South African native, we make an advance to the native before he comes to work. Those advances are limited by the Government. At the present time it is 2*l.*

1511. They have been 5*l.*, I believe?—Yes, and they have been unlimited. They were fixed at 5*l.* and then at 2*l.*, put back again to 5*l.*, and now brought down again to 2*l.* That is a great inducement to the native to come to work, because it enables him to provide for his family before he leaves, and settle his debts, and it is an inducement for him to have money to spend in the territory before coming to work in many cases.

1512. That advance is made by whom—by the trader from his own resources or by you, and passed on by the trader?—In the majority of cases it is made by us to the trader, and he passes it on to the native. In some cases the trader does it entirely himself.

1513. I see. Then in both cases the native receives a certain advance?—Yes.

1514. Which he presumably spends?—Yes.

1515. And then he has to give his labour to pay off his debt?—Yes, a proportion of his labour to pay off his debt.

1516. He comes here and receives pay at the rate of 2*s.* a day?—That is about the average.

1517. And his food represents a further 10*d.*?—Yes.

1518. Although it costs rather less?—Yes.

1519. I understand about 6*d.*?—Yes, I think so.

1520. And how much of that pay does he send home to his family, or take back with him?—It is very difficult to say, but from reports we have the native is getting more of a spendthrift and is taking less money home. There are all sorts of ideas on the subject, but we have reason to believe that he is taking less home and spending more locally.

1521. So he is less thrifty than he was?—Yes.

1522. How do you account for that?—I think there are more temptations put in his way, and he is getting used to more luxuries. He spends it on luxuries and also a large amount of money on drink.

1523. Illicit drink?—Yes.

* Mr. Villiers subsequently furnished the following particulars:—

Statement of Recruiting and Administration Expenditure for the year 1913.

Native Recruiting Corporation, Limited:

	£
Recruiting Expenses	173,593
Administration Expenses	82,416
Witwatersrand Native Labour Association:	
Recruiting Expenses	170,636
Administration Expenses	39,937
Independent Contractors (Estimated Cost):	234,000
Total Expenditure on obtaining Native Labour ...	£700,582

1524. Do you agree with the previous witness that illicit drinking is increasing?—I think it is at the present time.

1525. To the great detriment of the health and efficiency of the native?—Certainly.

1526. What steps are being taken to remedy that evil? Does your Department take any initiative in that work?—No; it is entirely a Government matter. We have no authority at all.

1527. Have you made any recommendations to the Government on the subject?—Various recommendations have been made by the industry from time to time, and the Government have tried to stop it, but they have not succeeded.

1528. And your deliberate opinion is that it is increasing?—I think at present it is. I do not think it is as bad as it was in the pre-war days, but it is certainly worse to-day than it has been.

1529. Is the difficulty of control very largely the result of a large number of traders establishing themselves along the Reef?—I would not like to say that the actual traders on the Rand are the means of supplying illicit drink to natives, but a large number of people who have no visible means of livelihood no doubt do live on this trade of supplying the drink. They act as agents for bigger people.

1530. Is there a considerable community here, then, which practically lives on this illicit drink traffic?—Yes, a large number of people. That is my opinion.

1531. Are they whites?—Yes, poor whites chiefly.

1532. Now, there are three systems of compounds, or, rather, three systems of housing the natives—the Kimberley closed compound system, the Johannesburg open compound, and the proposed native locations, in which the native would live with his family. What are your views on those three systems?—I think it is a very open question as to whether the gold mining industry could carry out the closed compound system as satisfactorily as the diamond mines at Kimberley. In the first place because the Kimberley boys engage for a very much shorter period than they do here. If they were confined in a closed compound some would be locked up for twelve months and many for six months. The average period, I think, for natives to work on diamond mines on the whole is not more than three or four months. That is the period that they are detained in the compounds. If we had to take boys only for three or four months we should lose greatly in efficiency, and we should want a larger number of natives to supply our demand than we do at present, because the native is not likely to work more than once a year. If he worked probably four months on a mine he would stay at home much longer than at present. Then when he came back he would work another four months. So, whereas we practically want two boys to-day to do twelve months' work, we should probably want three under that system. And another point is whether the older mines on the Central Rand have sufficient space to make arrangements for a closed compound, and whether there would be suitable ground. As regards the scheme of villages for the natives, I think where it is possible—for instance, on the Eastern and Western portions of the Reef—it would be very advisable to do it. I think it would encourage the natives to bring their womenfolk here, if the thing were conducted on proper lines. Respectable natives will not bring their women unless they are certain that only respectable women would be in those villages, but there is no reason why it should not be tried.

1533. You see no insuperable difficulty in organising that?—No. **(Mr. Taberer.)** Only in regard to the ground, of course. **(Mr. Villiers.)** The question is what form these villages would take—whether you would have housing accommodation plus agricultural land or small townships. If you had agricultural villages with allotments of land for ploughing and grazing you would want very considerable areas.

1534. Are those areas available?—Well, it is a difficult question to answer as to what proportion of natives would be married men with wives and families, and how much land would be wanted, but to do it on a large scale I think the native villages would be a long way from the mines.

1535. I suppose there is no difficulty in the gradual trying of the system?—I do not think so, on certain parts of the Reef.

1536. You suggest the outlying portions being tried first as being most suitable?—Yes, the East and West Rand.

1537. Coming back to the subject of the cost of recruiting—this 650,000*l.*—is there any means of saving that?—The reason for the high cost, especially among the British South African natives, has been due to this. Quite recently the various mining groups competed one against the other for labour. They had their various agents, who competed one with the other, and it is only in the last eighteen months that the Native Recruiting Corporation has come into being, which has amalgamated most of the various interests, and this has tended to bring down the cost of recruiting. As far as I am able to ascertain, the cost of recruiting to-day is very nearly 1*d.* per shift less than it was in the first six months of 1912.

1538. The figures being 5*d.* as against 6*d.*?—They were just under 7*d.* and now they are just under 6*d.*

1539. However, that figure still represents a large proportion of the native wages. It still represents something like 20 per cent. I am taking the amounts per shift, and the native gets about 2*s.*?—Yes. But I should like to point out about this 6*d.* per shift that it only applies to the recruited boy, because many boys come on their own and there is no payment. A large number are engaged in that way, and there is no expense. So I think that 3*d.* per shift is more accurate as regards the actual cost to the industry.

1540. Can you give figures showing the increase in the number of voluntary natives?—I have no particular statement, but from 1905 to 1912 the figures went up from 9,000 to 51,000. That is, purely voluntary boys. For the year 1913, owing to the industrial unrest here, our numbers fell to something like 34,000, but we cannot take last year—1913—as a criterion.

1541. Under normal circumstances you think the tendency is for the voluntary natives to increase?—Yes, largely.

1542. Do you consider that to be a better system than recruiting?—Much better. Our object is to do away with recruiting where we can.

1543. In regard to re-engagements, have you any tables showing the proportion of re-engagements. When boys come up for employment do you know how many are new and how many are old?—Yes, among the East Coast natives we know there are about 70 or 80 per cent. But we have no record of the British South African boys.

1544. Do you propose to publish such records?—No, we have not proposed to do so.

1545. Do you think there would be any advantage?—I do not think it is material. I think we can say that they are mostly old ones.

1546. You mix freely with the natives, I suppose. Would you say they are now satisfied with their treatment here?—I think they are, in the main.

1547. I suppose their treatment is much better than it was?—Yes.

1548. Is it very largely better?—Yes.

1549. In what particulars?—Feeding and housing, and the treatment of the native is far better than it used to be. It has been getting better for the last ten years or more, and everything is done for the native, or nearly all that possibly can be done for any labour force in the world. I do not think any other labour force is so well looked after as ours on the Witwatersrand.

1550. What do you say about rationing the native as compared with letting the native buy for himself?—I think that might be advisable in some cases. The rations supplied are of very good quality. They may be monotonous, although they are varied a good deal, and the native, in addition to what he gets inside, goes outside and buys a certain amount of food—more in the way of luxuries. In some ways I think it is better that he should be fed, because then you see that he is properly fed.

1551. Would a native, on the whole, prefer to be fed or to receive a payment in lieu of rations?—I think that depends greatly on the facilities given to the native to buy rations. The only natives who are allowed to feed themselves are those in the diamond mines in closed compounds. There it is very much easier to look after the natives than it is in the open

compounds. It is very essential, of course, that the native should be properly fed, but if he is allowed to wander outside and buy his own food you do not know whether he is properly fed or not.

1552. Is there any experience of natives not feeding themselves adequately?—I think a good many boys, if they had to feed themselves, would waste their money—in drink chiefly.

1553. So it comes down to this, that the real evil is the drink traffic?—It is one of the worst things we have to contend with.

1554. **(Mr. Campbell.)** Is there any restriction of the area over which the Native Recruiting Corporation works?—Yes. We are not allowed to go north of latitude 22 deg. south.

1555. Do you recruit only for the mines?—Yes.

1556. Do you recruit in Natal?—Yes, and in Zululand.

1557. Is there any restriction, so far as the Natal sugar-growers and tea planters are concerned, on their recruiting outside of Natal?—No. There are certain areas in Natal which are closed against recruiting for the mining industry. We do get natives from those areas, but they come voluntarily. They may come if they like, but we do not put recruiters in those districts.

1558. Has there been any discussion lately as to the restriction of the Natal sugar-growers and tea-planters with regard to recruiting outside?—No. There has been discussion, and it has been suggested that more areas in Natal and Zululand should be closed against the mining industry, but I have never heard it suggested that the Natal sugar-growers should not go outside for labour.

1559. There has been a suggestion that each Province should be closed as far as recruiting is concerned and restricted to its own natives, has there not?—I have never heard of that.

1560. The Witswatersrand Native Labour Association is purely a combination of the mines here for the purposes of recruiting?—Yes.

1561. Is it not a profit-making venture?—No.

1562. But yours is?—No.

1563. What is the reason for the existence of your Association? Is it a philanthropic body?—No. The Native Recruiting Corporation is an amalgamation of the various recruiting agencies of each group. Until about eighteen months ago every mining group used to compete with the other groups for British South African native labour. That system got so expensive that all the groups, barring one, agreed to combine for the recruiting of British South African labour.

1564. Then it simply consists of a number of recruiting agents who are carrying on their business as a Corporation?—The recruiting agents are simply the paid servants of the Corporation—paid by salary or by capitation fees.

1565. **(Mr. Lorimer.)** You say that the compound managers are licensed by the Government, but I suppose they are the servants of the mine owners, are they not?—Yes.

1566. They are responsible for the housing, feeding, and general well-being of the labourers—responsible to the mine owners?—Yes.

1567. Then what steps does the Government take to ensure that the conditions of its licences are observed?—The Government have inspectors who visit the compounds.

1568. You said you got Portuguese natives to contract for a year and you do not get any British South African natives for more than six months?—Some British South African natives do contract for twelve months, but the Portuguese natives are recruited in accordance with a Convention between the late Transvaal Government and the Portuguese Government.

1569. And what happens in the event of a native refusing to fulfil the conditions of his contract?—He would be taken before the Magistrate.

1570. What punishment is inflicted?—Fine or imprisonment.

1571. And is he sent back to work at the expiration of his sentence?—Yes.

1572. He is not allowed to go adrift?—No.

1573. **(Mr. Sinclair.)** Could you give us the age limits within which natives are employed?—From 18 to 45.

1574. **(Mr. Tatlow.)** Could you give the proportion of workmen recruited and those who volunteer their services, in respect of numbers?—It is about two recruited to one voluntary.

1575. In regard to a native location, would you favour the idea of a native township or the granting of land?—I think the granting of land would be better if it were possible.

1576. You spoke of it involving probably a long distance for the workman to reach his mine?—Yes. I say that if it is possible to give the land it would be likely to be some distance away.

1577. Do you think it is possible to provide sufficient land under such a scheme and keep the natives within a reasonable distance of the mine?—No, not with very large numbers.

1578. And in that case you would favour the township?—Yes.

1579. What would the native feeling be in regard to the township scheme?—The native would have to be educated up to it, like he has to be educated to work. He does not work by nature.

1580. A large number of the occupants of the native location would be single men, would they not?—They might be. But the idea is for a large number to be married.

1581. The workman, when he joins you, is free to fix the term for which he is to work?—Yes, he signs on for a certain time.

1582. What is the minimum term?—For recruited boys three months and for voluntary boys one month.

1583. It has been said that the native workman is inefficient because, to a great degree, he serves such a short period of service?—Yes.

1584. Is that period of service tending to lengthen at all as time goes on, or does it remain the same?—I think it remains pretty constant. I think the native likes to work for a few months and return to his home and family and belongings, and then come back again.

1585. Do they come back again year after year? If so, how many?—The native would probably work for a period of six to eight months in every fifteen or eighteen months.

1586. And for how many years will he come back, speaking generally?—Some have come back for the last twenty years.

1587. And the average would be what?—I should not like to commit myself to that.

1588. **(Sir Jan Langerman.)** What is the number of natives now employed on the mines?—About 178,000. It was 155,150 at the end of the year.

1589. And what is the shortage, according to the official complement?—About 100,000. The total is 250,000.

1590. Could the mines conveniently absorb another 150,000?—No, I do not think so.

1591. Another 100,000?—No, I do not think so. I do not think they would take them.

1592. What could they absorb?—About 50,000, I think.

1593. What is the cause of this shortage?—The industrial unrest—the strikes.

1594. Were the natives forbidden to come here?—They were told on all sides there was to be another strike at the end of the year, and a lot of boys took their passes and went. Thousands of boys who were time-expired went who would not have gone otherwise.

1595. You think there are natives to be had sufficient to make up the shortage, if they were induced to come out?—I think we could get a sufficient labour supply.

1596. If the unrest were removed?—I think they will come back gradually. They are coming back slowly.

1597. What is the reason the natives only stay so short a time? Is it disinclination for the work or because their families are away?—I think it is custom.

1598. The inducement to earn more money would possibly overcome the custom, would it?—I think if the native could advance in his sphere to more skilled

work he would probably stay longer. To-day he has nothing to induce him to remain.

1599. Suppose you increased his wages by 50 per cent., do you think he would stay longer?—I doubt that very much.

1600. You think the native is ambitious to rise and acquire skilled knowledge?—I am sure he is.

1601. So that if the colour bar were removed, you consider you would have more efficient labour and the natives would stay longer on the mines?—I think so. I think we could largely do away with recruiting.

1602. There would be an inducement to come and stay longer?—Yes.

1603. Have you made any representations to the Government to remove the colour bar?—When the colour bar was first inserted in the Mining Regulations the Chamber of Mines laid the matter before the Government and asked that the word "white" should be taken out for "competent labour."

1604. How long ago was that?—Four years ago, I think.

1605. If it is of such benefit to the mining industry that the colour bar should be removed, how is it that the agitation against this colour bar has not been continued or renewed?—I think the colour bar has been looked upon largely as a political question.

1606. Does the same colour bar, or the same disqualification or restriction, obtain in the Cape Colony, Free State, and Natal?—No. The colour bar, as far as I know, is confined entirely to the Transvaal.

1607. Therefore, you consider it is political?—Yes.

1608. Brought about by the Trades Unions, you think?—No; I think it is only to bolster up incompetent white men.

1609. **(Mr. Bowring.)** What reward is given to the voluntary boy here now?—None. The only advantage he gets is that he can choose the particular class of work which he does on the mine.

1610. He gets no money for coming on his own?—Nothing extra.

1611. **(Sir Alfred Bateman.)** In the Cape Colony, where the colour bar does not exist, are white and coloured workers working side by side?—Not in mines.

1612. Why not?—As far as I know, in the mines at Kimberley most of the natives are doing unskilled work under white supervisors.

1613. You mean they are not competent to do higher work?—They are not deemed competent.

1614. They are not prevented by law?—No. I think they are prevented by custom. I am informed that on some of the asbestos mines they have blasting certificates. Also, in the Cape Town Docks they work side by side, white and coloured, in lightering ships.

1615. In regard to the drink question, do you not think it would be possible to educate the native to drink properly? Could you not reform him?—I think he is very much like any other class in regard to reform.

1616. I was told by one of the Portuguese officials that light wine is given to the natives in Portuguese Territories. It has never been tried here, has it?—No. They are given Kaffir beer in the compounds.

1617. Of course, you are aware that in wine-drinking countries, speaking generally, there is practically no drunkenness?—I suppose it is less than in spirit-drinking countries.

1618. It has never been considered whether it would be possible to give light Cape wine to the native as an allowance?—I think it would soon be adulterated with spirit.

1619. You mean by these low whites?—I think so—very quickly. It would be a fresh cloak to the illicit liquor trade.

1620. **(Sir Jan Langerman.)** I should like you to give your confirmation or repudiation to certain evidence which we had from a certain witness. The following questions and answers were given†:—

"In what direction do you think they could get better work out of the native?—You will find the piecework system on the Rand is limited in the case of the native to a certain sum per day. . . . That is one direction in which that might be improved. There is an artificial limit of 2*s.* 3*d.*, I think it is, per day. . . .

"You say the native is limited in regard to earning capacity?—Yes, on the Rand.

"But is it not a fact that a native gets a certain amount if he puts in a 30-inch hole, and he can put in as many more inches as he likes and he gets ½*d.* or 1*d.* per inch more?—I think, if you make inquiries on that point, you will find that the practice varies on the different mines, and that on some mines—if the native drills beyond 36 inches, if he drilled 5 inches more—he would not get anything more for it. And there is another point in regard to lashing and tramming. The position of those natives is different. If the average boy's earnings on any mine exceed 2*s.* 3*d.* per day the mine is fined.

"By whom?—By the Transvaal Recruiting Association. They cannot give those boys more than an average of 2*s.* 3*d.*"

What is your answer to that?—There is a certain amount of truth in that. I would explain as regards the 2*s.* 3*d.* When the Corporation was formed it was resolved that all mines should pay the same rates of wages. That was to break down competition. But it was difficult to fix rates for the piecework system on different kinds of work. Some mines were doing machine work, drilling, tramming, and lashing on the piece-work system. For tramming and lashing the maximum average of 2*s.* 3*d.* was fixed. That was arrived at after going through the amounts paid for the whole Rand, and the 2*s.* 3*d.* was rather higher than the average. Certainly, in the case of certain mines the figure was somewhat higher, and the reduction possibly did discourage a few boys who had been in the habit of earning high rates. With reference to machines, it has now been found possible to fix a basis for piecework rates by which the earnings of the native are absolutely unlimited. On hammer work the natives have never been restricted. They can earn as much as they like at drilling, and so it is to-day. As regards tramming and lashing, we have altered the maximum average, and it depends on the number of boys employed. If 25 per cent. of the boys employed on tramming and lashing were on piecework the maximum average would be 2*s.* 9*d.* If 50 per cent. it is 2*s.* 7*d.*, I think, and so on; the reason for that being that among your tramming and lashing boys, if you put the whole lot up to 2*s.* 9*d.*, you would be paying boys perfectly uselessly for their work. We hope later on to fix some sort of scheme, to fix the price of tramming and lashing on the cost per ton, but owing to the differences on various mines, and considerable differences in different parts of the same mine, we have not been able to arrive at any satisfactory figure yet.

1621. **(Mr. Sinclair.)** In regard to fixing this maximum, can you tell us what percentage of the workers earn more than the maximum?—A very small percentage of the total labour force were engaged in tramming and lashing on piecework till recently, but to-day we are encouraging them as much as possible everywhere to go in for piecework. We think it will lead to increased efficiency.

1622. Can you tell us what proportion of those who are affected now by the maximum that has been fixed were earning more than that? Was it a small proportion or a considerable proportion?—A small proportion.

1623. **(Mr. Campbell.)** In the case of medical examinations, is there any large proportion of natives rejected on account of disease before leaving their homes?—About 5 or 6 per cent.

1624. And of those who are not rejected and who are examined by the medical officer attached to the Chamber of Mines, is there any large portion rejected?—Just under 2 per cent.—that is in the case of British South African natives. The rejections in regard to Portuguese natives by the Chamber of Mines medical officer are considerably less than that.

1625. Is it only in the case of infectious and contagious diseases that they are rejected?—No; they are rejected for being physically unfit.

1626. In regard to those who do not fulfil the term of their contract and who are brought before the

† See evidence of Mr. M. S. Evans, C.M.G., p. 24.

Magistrate, is there any large proportion of those who do not carry out their contract?—Very few. The number of desertions is very small. There used to be a great number in the olden days, but now it is very small.

1627. How, with the open compound, do you manage to control desertions?—The boys do not want to desert. And besides that, of course, there is the pass system to check them.

1628. **(Chairman.)** Then you look to the improvement of the native to proceed from greater opportunities for industry and skill on his part?—I think it will encourage them to increase their efficiency very much.

Mr. Hans Neuhaus, Mr. Edward John Way, M.Inst.C.E., M.Inst.M.E., &c., and Mr. William Gemmill, representing the Transvaal Chamber of Mines, called and examined.

1629. **(Chairman.)** Are there any statements showing the present position of the gold mining industry which you can put in for our information? — **(Mr. Neuhaus.)** I have not prepared any statement, but I can give you any information you may want.

1630. There is a statement which was presented to the Mining Industry Commission in 1908, shown on pages 255 and 258 of the report of that Commission. If that statement can be brought up to date it may be of value to us?—Some of these figures have been brought up to date, but perhaps I can give you some other information. Up to the end of last year the total tonnage crushed was 230,000,000. Those figures apply to the Rand alone, and the total gold produced was 382,585,000*l.* The total dividends paid amounted to 96,270,000*l.* During last year, *i.e.*, 1913, the total crushed was in round figures 25,559,000 tons, the value was 35,530,000*l.*, and the dividends paid £8,100,000.

1631. The total gold produced was 35,000,000*l.*?—Yes, roughly.

1632. Of which 8,000,000*l.* were paid in dividends?—Yes.

1633. Can you give us the utilisation of the balance—how much went to white labour, how much went to native labour, and how much went to stores and depreciation?—I can give you an approximation to that. The working costs accounted for 23,000,000*l.*, dividends for 8,000,000*l.*, and profits tax 1,000,000*l.*

1634. That brings it to 32,000,000*l.*?—The difference is accounted for by capital expenditure, depreciation, interest on debentures, carry forward and sundries. Of the working costs about 41 per cent. represented stores, 33 per cent. salaries and wages to whites, and 22 per cent. native wages, and 4 per cent. recruiting charges and pass fees, claim licences, &c. You may also be interested in the market value of the shares. These figures are for producing mines only—that is, those producing in February of this year. The total nominal value was 44,390,000*l.* At the end of February the market value was 70,000,000*l.* In addition to that there are debentures outstanding applying to those mines of about six and a half million pounds.

1635. Do you know what the value of the shares of the non-producing mines represents at the present time?—No, we have not been able to get any exact figure, but approximately five millions.

1636. The estimate given to the Economic Commission of the total remaining to be crushed in actual producing mines amounted to 587 million tons, did it not?—550 million tons.

1637. Which is rather more than twice what you have already crushed?—Yes, 230 million tons as compared with 550 million tons. I should explain, regarding this estimate, that it is based on the present working costs. If the working costs alter in a downward direction this tonnage would be increased.

1638. Can you say at all in what proportion the tonnage would be increased for a given figure of reduction?—No. Estimates have been attempted, but we have not been able to obtain anything reliable for ourselves at all.

1639–40. A witness this morning stated his view that as the costs have been reduced in the course of the last ten years by something like 6*s.* per ton a further reduction was probable in the future. Have you any definite views on this subject?—I have expressed my view that that would be likely. Probably Mr. Way would like to give his view from an engineering point of view. **(Mr. Way.)** The probability is that costs will be reduced by increasing the engineering facilities and by making better use of the labour than we are doing at the present time. You must understand me clearly in regard to that, because I consider we are making the best use we can of the labour on the present conditions, but we are debarred in certain ways from making the full use of it. The regulations lay down certain cases in which natives cannot be employed, and we think that in a great many of those instances, if this bar were removed, they could be much more profitably employed than whites are at the present time, so far as the industry is concerned, and that would tend to reduce working costs.

1641. Have you anything to add, Mr. Neuhaus, to the estimate of life furnished to the Economic Commission,* or have you any comments to make? — **(Mr. Neuhaus.)** The estimate furnished to the Economic Commission applies only to mines now crushing, and is made, as clearly indicated, on the basis of present costs. It follows that if costs are reduced in the manner just suggested by Mr. Way these mines will produce a greater tonnage than the 550,000,000 tons put forward in the statement to the Economic Commission. A reduction in costs would also make it easy to raise further capital and enable the other areas referred to in the Economic Commission's statement—namely, in the far East and South West Rand—to be more readily attacked. Hence, it is to be expected that new mines will come into existence which will more than counterbalance the decrease anticipated in the output of the present producing mines. My view of the position is that while conceivably we may have reached the approximate high-water mark of the industry from the point of view of production, and are now, as it were, standing on a plateau, we shall be able to remain on that plateau for a much longer period than indicated in the Economic Commission's statement, owing to the supply of more tonnage than estimated from existing mines and to the accession of new mines. Further, that the descent from the plateau may be much more gradual than the statement assumes it will be in respect of the mines now producing. It is well to point out again that the Economic Commission's statement, in so far as it gives figures, does not purport to give the life of the Rand, but deals only with existing mines under present conditions.

1642. Is it your experience that the life of the mines exceeds the figure calculated in advance?—My own experience is limited. As far as it goes, it goes to show that it does. I am Chairman of one Company, for instance, which should have been dead two or three years ago, but it is still producing at a profit.

1643. And that is not a solitary case?—Certainly not.

1644. What capital do you estimate is required for the development of these claims on the eastern section?—I do not know. **(Mr. Way.)** I think at least one million pounds per thousand claims. Taking it on the basis of 1,000 to 1,100 claims I think about one million sterling is necessary

1645. On that basis, if there are 86,000 claims, you would want 86 millions?—I think it would be very misleading if that went forth, because it cannot be conceived that the whole 86,000 would be entirely payable on our present knowledge.

1646. The number of payable claims would be reduced and with them the capital required?—No. Supposing you have a block of 1,000 claims, you would still require one million pounds to develop them. There may be only one-half or two-thirds really payable, but the money would have to be spent in getting

* See Appendix IV., p. 108.

your knowledge and putting up your plant, but it might be possible to segregate the areas from the knowledge that may be acquired later on into known areas in the eastern district which might not pay. They might be set off at once. I do not say it is probable, but it is possible.

1647. Mr. Neuhaus, with your present labour force, which, I think, is stated to be beneath your requirements, do you consider it is employed to the best advantage of the shareholders of the companies and the workers?—**(Mr. Neuhaus.)** Considering the obligations imposed on us by regulation, chiefly referring to the colour bar, the probability is that it is, but, of course, the important phrase there is "considering the obligations imposed on us," which obligations are really artificial.

1648. I think we will ask Mr. Way for details as to that later. You say that the colour bar is the principal reason why your labour cannot be utilised more economically. Are there any more reasons?—What do you refer to?

1649. Management and direction. Different views are taken as to the economics of amalgamation—greater or lesser economy?—I think that generalization on such a subject is very dangerous.

1650. Can you be more precise?—We have just had the engineer of one very important property concerned in an amalgamation that has recently taken place, who has read a paper showing conclusively, as far as the layman can see, that amalgamation in that instance has been extremely profitable.

1651. You would not go further than that?—No.

1652. We are speaking economically—not politically?—I am looking at the question from an economic point of view.

1653. Is there any reason why the advantageous results of past amalgamations should not be derived from future amalgamations?—No, I think not.

1654. Can you state at all what proportion of the mines now crushing are producing at an insignificant profit, say, less than two shillings?—I have a statement showing the segregation of the output last year as between dividend and non-dividend paying mines, and that shows that the dividend-paying mines accounted, as regards costs, for about 85 per cent. of the total—that is to say, that while the total costs were 23 millions approximately, the costs of the dividend-paying mines were 19½ millions, and 3½ millions were spent on mines which paid no dividends. They may have paid off some debentures, of course, I do not know. Regarding the other point. During December, out of 51 mines there were eight making a working profit of two shillings and less. The working profit is the profit declared and does not allow for profits tax, depreciation, and capital expenditure. Mr. Way points out that Statement No. 3 of the Economic Commission—the evidence led by the Chamber of Mines*—goes into this matter in great detail. That is page 85. On page 87 you will find a list of mines working at less than five shillings per ton profit.

1655. Now turning to another subject—what is the cause of the extreme instability of white labour?—It is a question which has been much discussed, and I think, on the whole, opinion is crystallizing to the effect that it is due to two causes principally—the inefficiency of a considerable proportion of white labour on these fields and to the hunt after the big cheque, which is a prize much sought after, naturally. The inefficiency of a certain proportion of this labour is, I think, undisputed by everybody acquainted with the conditions, and it naturally causes such inefficient people not to earn as much as they expect, and the mines being contiguous to each other, the temptation is great for them to go and try their luck on some other mine, hoping they may do better. Again, the managers, having a certain number of inefficient men and being always on the look-out for better men, make no great effort to stop this shifting.

1656. Do you think that real efficiency is possible under conditions of such instability and change?—Certainly it is a great bar.

1657. Has the Chamber of Mines any definite policy as to putting an end to this state of things?—We led evidence on this point before the Economic Commission.†

1658. Is the Chamber acting upon it?—No definite policy has yet been agreed upon.

1659. There is a state of affairs which everyone admits to be unsatisfactory to the progress of the industry?—We are asked to do away with the flat contract system, which I think has been in vogue on the fields here since they have been in existence. It is now suggested by a number of our technical advisers that we should abolish this system. This is an important decision to take and you will understand that it takes us some time to agree on a point like that.

1660. We may take it that the subject is one under active discussion?—Oh, very much.

1661. I need not ask you about contract work for natives?—We are in favour of the piecework system, and have extended it very much. One very important branch which has always been piecework is that of hammer boys. We have extended it now to machine work, and are extending it to tramming and shovelling.

1662. Do you agree with the evidence given this morning that one requirement to increase the efficiency of the native is to enlarge his scope. I do not mean the class of work he does, but to enlarge his chances of getting a larger day's pay?—If you mean that it is necessary to add the element of ambition, I think it would help immensely.

1663. Not only towards his efficiency, but his development also?—Certainly.

1664. Now, in regard to white labour. Is the present system, under which white labour is engaged by each individual mine, superior to having a Central Labour Bureau?—In that question, again, is involved the work for which the white labour is used. It is used here almost universally in a supervisory capacity. It depends not only on the skill of the man but on his character; therefore, it is necessary for the individual man to come into contact with the man who engages him, so that he can see for himself whether he is the kind of man to be put in control of other labour.

1665. Judged by the eye?—And by discussion with the man.

1666. It does not seem to lead to a very good selection?—That is due to the fact that we have not got a very good quality to select from. But we have not taken up a final or definite attitude on the subject of a Central Bureau.

1667. Has it worked at all up to now?—**(Mr. Way.)** I quite agree with Mr. Neuhaus. You must make the manager responsible for the work that takes place on the mine. He must be directly responsible for taking on his men. If you have a Central Bureau they send out so many men of different classes for employment and the mine has to take them on because they have been engaged by the Bureau. But they do not look to the manager—they look to the Bureau, and then when they are dismissed for incapacity they have a grievance against the manager, and not against the people who took them on. It should be the same both ways. The Central Bureau system might be all right if you were employing 20,000 navvies to build a railway, because you are employing one particular class of workmen; but because these mines are contiguous to each other it does not necessarily follow that they are similar as to working conditions. Men who are successful on the Eastern Districts of the Rand are not necessarily successful on the Western Districts, and *vice versa*.

1668. About the compound system: there are practically three kinds of housing for natives—the closed compound, the open compound, and the location. Has the Chamber of Mines any definite policy on that subject?—**(Mr. Neuhaus.)** We gave evidence on this question some months ago to the Black Peril Commission, and then we said that "as regards the compounding of mine natives the Chamber is satisfied with the present system. The closed compound system would introduce a great innovation, and it is for the Commission to decide whether it is in the interests of the community and whether circumstances warrant such a change." The Commission recommended the closed compound in regard to the gold mines. I have

* "Transvaal Chamber of Mines. Statements presented to the Economic Commission." Johannesburg. 1913.

† See Appendix V., p. 109.

the report of that Commission here (*handed in*).* The Chamber has not discussed the matter in detail, largely because it is felt that, in view of the tremendous amount of interests which have grown up in the last twenty-seven years, it is inadvisable and impracticable perhaps to adopt a system which is in force at Kimberley and the Premier Mine.

1669. Let us go a little more closely into that. You say even if these reforms were desirable vested interests would make it impossible?—I did not say that, quite. But it seemed to the Chamber impracticable at the moment to go further.

1670. Assuming that such reform is desirable, what are the difficulties opposed to it?—Probably the chief is the interests of traders along the reef, who depend largely on the free ingress and egress of the kaffirs for their trade. We supply the natives with their ordinary food, but everything else he buys at the stores.

1671. Are those traders licensed by Government or not?—**(Mr. Gemmill.)** The answer is, I think, that, generally speaking, some are granted sites by Government on mining ground, but there are also private stores not on mining ground which do not require the Government grant of a site.

1672. Why are some licensed and some not?—As far as I know it is a store on mining property that requires to be specially permitted.

1673. And is that licence (permit) renewable from year to year?—I am afraid I cannot give you the information off-hand. **(Mr. Neuhaus.)** I think the stands are put up by auction and sold at a certain annual rental.

1674. He competes for the right of trading in a certain area or district?—On these mining areas there are a certain number of stores and they are limited now. Previously, I believe the basis was that the mines thought they had the right to grant trading stands on mining property, but this was ultimately found to be not correct and the Government took control of the matter. There is a comparatively large revenue received by the Government from these.

1675. That means it is a Government monopoly which the Government sublets?—Yes, to some extent.

1676. Does that rental received by the mines convey any guarantee against disturbance?—I cannot tell you. I suppose it must do so, because otherwise the people would not pay these large sums for the rights. I think the best procedure is for us to submit a written statement to you on the subject.†

1677. The position, I understand, is this, that a certain reform is proposed, and the statement is made in reply that, whether good or bad, it is impossible?—I never said it was impossible.

1678. Well, impracticable. I want to see what the real ground of impracticability is?—Of course, there are other difficulties involved, for instance, that the natives come up here for periods which vary from one month, in the case of the voluntary native, to twelve months in the case of Portuguese natives, and, in very many cases, they stay much longer. At Kimberley the natives contract for shorter periods, and are, I believe, not allowed to renew, so that the closed compound system only means they are deprived of their liberty for a short period, while here the period would be much longer.

1679. We were informed by two witnesses this morning that this illicit liquor dealing is a growing evil: is that your view?—It is certainly a great evil. I am not in a position to say whether it is growing. There is a special department of the police which deals with that and which would give you evidence on the point.

1680. They are responsible for its not growing, are they not?—I do not think they would hesitate to give you figures as to convictions. **(Mr. Gemmill.)** I have figures to show the number of shifts lost through drink. In December, 1911, 2·2 shifts were lost per month per hundred employed; in December, 1912, the figure was exactly the same, and in December, 1913, it was 1·9. The figure appears, therefore, to have been fairly steady throughout those periods.

1681. I presume there can be a good deal of illicit liquor without loss of shifts?—**(Mr. Neuhaus.)** In connection with the illicit liquor question, it may be worth noting that there are two forms of it. The first is the sale of the liquor by whites to these natives illicitly, and the second is the manufacture of the liquor by the natives themselves out of ingredients perfectly innocent in themselves, such as golden syrup, which they obtain from the storekeepers. I am inclined to think the latter is the greater danger. Of course, if caught, they are punished, but that is a form of the business in which whites are comparatively innocently employed. They only sell the golden syrup to the natives.

1682. Can you give us any views as to the present system of recruiting natives?—I think, under the circumstances that prevail, the present is the only one we can adopt.

1683. Do you consider the cost heavy?—As a rule it is heavy. I think in due course we shall be able to reduce it; and perhaps the removal of the colour bar, if that could come about, would open up higher spheres of employment for the native and induce still more voluntary natives to come forward and thus make it less necessary to recruit. That may result.

1684. The view has been put forward that, if the money now spent on recruiting, namely, 650,000*l*., was added to native wages, the results would be better?—I personally doubt it. It might improve slightly. But you must remember that a large proportion of that sum is spent on the East coast, where the system of recruiting is entirely different from that in the Union of South Africa. The East coast system is practically only a forwarding agency. The expenses are in regard to payment of runners and travelling expenses of natives. On the other hand, the expenses in the Union of South Africa are of a different class, in that a certain number of white people are actually paid a reward for getting the natives out. As long as we get natives from the East coast, I doubt if that portion of the expenditure can be reduced very much, and, as regards the natives from the Union, if we stopped the capitation fees to recruiters we might have to pay the rail fares of the voluntary boys and have other expenditure. After all, the whole figure is less than fourpence a shift, I think.

1685. It was said it was threepence a shift taken over the whole number. If applied to those whom it affects it is just under sixpence?—The boys recruited by the Native Recruiting Corporation cost about sixpence, those of the Witwatersrand Native Labour Association about 3½*d*., and the balance nothing. The whole average is a little under fourpence, I think.

1686. Have you any figures or information as to the prospects of life for a white miner entering employment on the mines here?—**(Mr. Way.)** That is rather a difficult question to answer. One has heard much about the average life of the miner in the past, but, I think, now that the miner's phthisis regulations are being carried out, the miner has as good a chance here as in any other mining camp in the world and probably better—I mean in metalliferous mines.

1687. Are any figures available showing the benefit derived from the phthisis regulations?—**(Mr. Neuhaus.)** There are no figures, but the information lately from one end of the Rand to another shows that the condition of the mines to-day is totally different from a few years ago, so much so that people who are entitled to speak from personal experience tell me that the chances of getting phthisis to-day for a man coming to the work are reduced to such an extent as to be almost negligible. **(Mr. Way.)** I confirm that.

1688. Do you consider that the uncertainty of life in the past for the white miner has been one of the causes of the instability of labour?—I could not say at all. **(Mr. Neuhaus.)** There is a long statement on the phthisis question in the "Statement presented to the Economic Commission," in which we dealt with this matter with considerable detail and which still holds good—page 68. That deals with the history of the phthisis question here.

1689. We will take the reference. What is your white labour supply? Is there difficulty in finding an adequate supply of white labour or not?—**(Mr. Way.)** Yes, the supply is not equal to the demand—that is to say, of efficient men who understand their business. I should like to point out in regard to this phthisis

* Report of the Commission appointed to enquire into Assaults on Women, U. G. 39, 1913.

† See Appendix XL., p. 114.

question, in going into this question for the Economic Commission, we found that in other countries no enquiries of any importance had ever been held as to the percentage of the men in mines who suffered from this disease, no enquiries of anything like the extent of the investigation which had taken place here. No comparative figures were available. In other countries Governments have refused to subscribe to the cost of enquiries. In the United States, for instance, they would not even allow private enquirers to find out what influence the existence of phthisis had on the supply of miners in the States. We have a bad name because we publish the true state of affairs.

1690. You think the extra bad name is not deserved?—I think the disease has been bad, but I think it may be equally bad in the United States and Australia.

1691. Can you state the proportion between machine drilling and hand drilling, and what the tendency of those proportions is?—In December, 1913, the proportion of machine boy shifts to hammer boy shifts was as three to seven—three machines to seven hammers.

1692. Does that indicate a further large field for economy of labour upon the further introduction of machines?—The introduction of machines depends a good deal more upon other things than economy of native labour. It depends on the physical characteristics of the mine. There are mines where it would be uneconomical to use machines haphazard and wholesale, because the machine breaks a greater width in the stope and brings down more waste rock, which cannot be eliminated, as it can from a stope run by hand labour.

1693. Does that apply to large and small?—More large than small, but to small more than to hand labour.

1694. What is the economy of labour produced by the substitution of machines for hand drilling—take 100 tons. You want how many boys for hammers, and if you use machines how many do you want?—The rough average of the amount broken by a hammer boy on a shift is in the neighbourhood of about 0·8 of a ton.

1695. Now the number of tons broken by machine? You say there are two boys on a machine. The object of my question is this: You suffer chronically at the present time from a shortage of native labour; one of the means of meeting it would be to employ more machines and fewer hammer boys?—Yes.

1696. How far would economy in that direction be possible?—As I pointed out, the physical conditions also enter largely into the matter. It might be that a mine which was struggling along on a hand stoping basis might make a loss if it took out its hand labour and put in machines.

1697. But on such mines where machine drilling is possible, what is the economy of natives which you would achieve thereby?—I am not quite certain of the figure now—what amount of tonnage is broken per machine. It varies, of course. We pay on rock drill work on stoping on the basis of a square fathom. I am uncertain about the number of tons that are broken with a big machine.*

1698. Mr. Ross Brown, in his report of June, 1907,† says: "Where the engineer has failed to produce results has been in the handling of labour." Is this still true, and is the present labour inefficient?—The present native labour is infinitely more efficient than at the time Mr. Ross Brown made his report.

1699. And white labour?—That has gone off.

1700. I think you were going to make a statement regarding the colour bar; what is your view in regard to that?—It is mostly set out in this statement which we made before the Economic Commission recently, pointing out exactly where the Government prevents us from employing natives in various capacities. (Page 178 of the Chamber of Mines' Statement to the Economic Commission.) The banksman must be a white man; we can get many competent natives to do that work. The ganger must be a white man; it is quite possible for certain natives to do certain duties now performed by the ganger. The white man could be put on a higher supervisory basis, and let the duties which he does as ganger to-day devolve on a trained native. The onsetter must be a white man, but an intelligent native is just as good. Of course, the rate of pay which we would give, although more than the average, would be less than the wage we pay the white man. In fiery mines all lamps must be inspected by a white person. We think there are many natives just as competent to do that. I may say here that in handing in this statement I was asked a direct question by the Chairman as to whether I was in favour of a native being a mine manager. I replied that if he was competent I saw no reason why he should not be. So that we do not want to make any class distinctions in regard to this matter. We want equal liberty. We want equal opportunity between the native and the white man. At the present time the tendency of the law is to bar a native from doing work which he is as competent to do as a white man.

1701. And you think the removal of that bar is the best step towards increasing native efficiency?—Yes.

1702. One other question: the statement of the Chamber of Mines to the Economic Commission limits the payable working of the mines to 7,500 feet?—Yes, vertical depth.

1703. Have you any views as to whether it is adequate or excessive?—I remember the time when 2,000 feet was considered the limit here, but as we got on with the work, and as other mines in other parts of the world got deeper, we thought we could go deeper too. The reason why 7,500 feet is stated in the report is that at the time the Chamber of Mines were making investigations into the question, I put a question to the Government Mining Engineer as to what he considered would be his view, and he said he was not prepared to recommend to the Minister the proclamation of any gold bearing areas where the lodes would lie at a depth greater than 7,500 feet. That is why we adopted that figure. As we get to work we shall probably get down much deeper.

1704. But I presume the depth to which you can go depends in a very great measure on the richness of the ores you find there?—That is, of course, one of the greatest points. I think it will be a continuation of the outcrop workings or sub-outcrop workings or deep level workings in the deeper levels rather than sinking a 7,500 shaft from the surface.

1705. As far as regards the increase of heat—have you established a definite law?—There is diversity of opinion. Some very careful experiments have been prepared, and there are shafts over 4,000 feet deep where temperatures have been taken, but engineers are not yet agreed as to what the variation is per hundred feet of vertical depth.

1706. Within what limits do they differ?—I cannot say; it is generally admitted that temperature rises 1° F. for every 245 feet vertical in depth.

1707. **(Mr. Lorimer.)** What is the greatest depth at which any mine is being worked on the Rand at present?—About 5,000 feet.

1708. And if that mine went down to 7,000 feet, and it could still be worked at a profit, would it under the present regulations require to be stopped?—No.

1709. Then what is the difference in temperature as you go down—say taking 1,000 feet?—The figures are not yet quite settled—there is some diversity of opinion on the point.

1710. What is the temperature at 1,000 feet?—About 70 degrees.

1711. Is it pretty uniform?—Yes.

1712. What temperature would you have at 5,000 feet?—The determinations were one degree for 240 feet, but recently some doubt has been cast on those figures by other engineers, and the figures are not quite correct.*

1713. I am asking this question with a view to the consideration of how it will affect working costs.

* The Chamber of Mines subsequently stated (in a letter dated April 18, 1914) that one native shift with a large machine breaks rather more than four times the tonnage broken by one native shift with a hand hammer.

† "Working Costs of the Mines of the Witwatersrand." Paper read at the General Meeting of the South African Association of Engineers.

* See Appendix X., p. 113.

Naturally, when you get into a high temperature you cannot get the same amount of work?—We have overcome that difficulty by a system of ventilation which is already widely adopted.

1714. Does it reduce the temperature?—It does.

1715. Then if that difficulty were overcome at great depths, the only additional costs would be for longer haulage and the longer distance to raise the ore?—Yes.

1716. I gather from you that it is a matter of extreme importance to future developments that working costs should be reduced?—**(Mr. Neuhaus.)** Yes

1717. Have you any idea of how that could be done?—By the better use of native labour—the abolition of the colour bar regulations.

1718. Your labour amounts to about 32 per cent. of the total working costs?—33 per cent. That is white labour only. Coloured labour, 22 per cent.

1719. What are your stores?—41 per cent.

1720. Is there room for reduction there?—New economies may reduce it, and, of course, if railway rates are reduced and prices, it will cheapen stores. But I do not think there is any waste at present.

1721. What proportion of those stores is chemicals?—Cyanide accounts for about 5 or 6 per cent. of our store bill. That is our largest item in chemicals.

1722. You say you have to provide a sinking fund to redeem certain capital expenditure out of your profits every year?—No, we must allow for the redemption of capital expenditure before we calculate what interest we are really earning. The position is set out in the statement to the Economic Commission.*

1723. I gather from this that before you declare your profits you set aside a certain sum for amortization?—No, it is in arriving at what our real profits are.

1724. Then it is merely a figure in your head?—Yes.

1725. It has not to be set aside and invested in any way?—No, but the Government allows us to amortize our capital expenditure before paying our profits tax.

1726. Does all the capital in these mines represent cash paid up? Suppose there are 150 millions of capital invested in mines on the Rand, does that represent 150 million sovereigns paid out of somebody's pockets?—I do not quite appreciate the point.

1727. Some of the original prospectors took shares in payment?—Yes, distinctly.

1728. Do you know how much cash has actually been paid?—71 millions is the figure. That is of the producing mines, and it excludes the cost of the property itself.

1729. Now, you say that the profits tax amounts to one million a year?—Yes, in round figures.

1730. On what profits?—On the profits made by the mines, after deducting working costs and an allowance for amortization of capital actually put into the mines.

1731. I want to know what proportion of the profits is paid to Government. You say it is one million? What percentage?—Ten per cent.

1732. Well, you get off easily compared with the Premier Mine?—That is a totally different proposition. The Government are part owners of that.

1733. Does the ore get harder to work as you go down—the hardness of the rock, I mean?—No, I do not think so.

1734. So it is the increased cost of raising the ore, then, that you would have to face at greater depth?—Yes.

* This shows that the cost of production is taken to consist of the following items:—

(a) Working Costs.

(b) Other operating costs, not already included in (a), such as Miners' Phthisis Contributions, Donations, Bonuses, etc.

(c) The annual amortisation allowance to redeem the working capital expenditure of each mine during the estimated producing lifetime of the particular mine.

This allowance to be calculated at the rate adopted by the Government under the Mining Taxation Act, namely, 3 per cent. compound interest.

(d) A similar amortisation allowance to redeem the price paid for property.

From the margin between revenue and cost of production is then deducted profits tax, and the result is the net margin available for remunerating capital.

1735. **(Mr. Sinclair.)** I take it that the Chamber of Mines is a body that represents broadly the mines of the District?—It represents practically all the gold mines of the district. The Premier is also a member, also certain outside gold mines—the important ones—and also many coal mines. I think it represents what its name represents—the Transvaal mining industry.

1736. You are an entity representing the industry; are you able to get into touch with an entity that represents the white worker?—The trades unions? No, the Chamber of Mines, as such, has always adopted the attitude of leaving that to the individual mines.

1737. There is no body between your body and the workers?—No.

1738. And there is no touch between you and the coloured worker?—No, they are not united. In connection with the white artisans possibly a partial exception is an arrangement made some years ago between the Transvaal Chamber of Mines and the Union dealing with engine drivers. That is the only exception.

1739. The individual mine gets into touch with the trades unions so far as the white worker is concerned; as regards the coloured worker I understand there is no organization in existence which represents him?—Yes, the Director of Native Affairs and his inspectors. The Government puts itself into the position of protector to the natives. They have direct protection, and through our organization, the Native Recruiting Corporation, we pay attention to the wishes of the native labourers. They have easy access through that organization for the hearing of any complaints. There is a compound manager who is directly responsible for the well-being of the natives, and complaints are made to him, and I think I may say they are immediately investigated.

1740. Do I understand you to say that you favour piecework?—Yes, as the system of employment of the coloured workman.

1741. The effect of the application of the piecework system to the coloured worker would be, from the mining point of view, a reduction of cost?—Yes, per unit of work done.

1742. Can you tell the Commission what, in your opinion, would be the particular effect of the adoption of that system upon the coloured worker; would he benefit or otherwise?—I feel sure he would benefit by the higher wages, and I think he would work more regularly. It can only be to his benefit, I think.

1743. Would the representatives of the coloured worker, to whom you referred, in case of need protect him from the effects of—I do not like to use the word "sweating"—but the increased exertion that he would have to put forth if the contract system were adopted?—The system has been in force for some time.

1744. I am speaking of the coloured worker?—Yes. It has been adopted for hammer work for many years. I have no doubt whatever, from experience, that if there was anything like driving the native too fast, we should soon hear all about it. Mr. Pritchard is a most energetic official, and looks after the natives very well; so does his staff, which visits the mines continually.

1745. I wanted to speak about the position of the stores that look to the native as their customer. They pay certain sums to the Government for the privilege of occupying the positions they have?—Some do—it is a single payment in other cases.

1746. It does not give the right for all time?—There is an annual rental—a small one. But I prefer to leave that question of the exact terms over and let you have a statement,* because none of us are exactly informed as to the details.

1747. I should like to ask if there is a fear on the part of those who keep these stores that there may be competition against them. Are they afraid of the mines entering into competition?—We have never discussed it with them, so I do not know.

1748. Do you think it would broadly be in the interests of the worker if the mines themselves had stores and sold without attempting to undersell the present storekeepers?—Are you talking of food?

* See statement by Mr. Schumacher, Appendix XI., p. 114.

1749. Yes. Everything that they require and purchase from these stores?—Unless we adopt General Gorgas's recommendations and allow them to buy their own food, I see no great reason for establishing stores.

1750. But it was put to you by the Chairman that the carrying on of the business of these stores under existing conditions really amounted to a monopoly. Have you considered that monopoly? If you consider it objectionable, would not you have a remedy in opening stores yourselves without attempting to undersell the storekeeper?—No, we are not allowed to. I can give you chapter and verse.

1751. Is it a statutory provision?—Yes.

1752. As regards liquor, it is the case in some other parts of the world, is it not, where there are mines, that the efficiency of the worker is reduced in the early days of the week owing to indulgence in liquor? —I am afraid I have no experience elsewhere.

1753. Have you no knowledge of the conditions that obtain in some of the coal-mining districts in the Mother Country, for instance, in regard to the slackness of the worker during the early days of the week? —I have been told there is such slackness.

1754. And within certain limits you must look for it, must you not—the same condition?—Yes, but our objection at present is not so much because we lose a shift or two. If that were all, I do not think there would be much objection.

1755. The evil is a very real one everywhere?—Yes; but, as far as South Africa is concerned, it is not only mining districts which are in question, I think it is practically the law all over South Africa that liquor must not be sold to kaffirs because it makes them into dangerous individuals. It has nothing to do with mining.

1756. You gave the number of shifts lost per month by indulgence in liquor, and it was to that point I was directing attention. As regards the cost of recruiting—that will be lessened, will it not, as competition ceases or lessens between the different mines, brought about by amalgamation for the purpose of recruiting?—It should do so.

1757. (To **Mr. Way.**) I wanted to ask whether, broadly speaking, you regarded the coloured worker in the mines as economical?—**(Mr. Way.)** Yes, as compared with white labour. It is certainly impossible for the white man to do the same work for the same money.

1758. So far as the actual work is concerned in the mines, it must be carried out by coloured labour? —Yes.

1759. So that even if you had any large numbers of white workers available they could not do the work as economically as the coloured worker?—Certainly not.

1760. For all time, the coloured worker has captured the mines?—Yes. It is the cost of living. That is all dealt with very closely in this statement to the Economic Commission that has been referred to.

1761. Arising out of that answer, within what limits do you suggest that the efficiency of the coloured labourer is confined? Is he to be the manual worker in the mines for the future? How far can he go? Of what is he capable?—Any distance if you give him time, as a manual worker.

1762. On page 178 of the statement to the Economic Commission there are certain directions in which it is suggested that he could with advantage and safety be employed, in which he is not employed at present, owing to legislation. Are there other directions in which he could be employed, as the result of discipline and training that he gets as a manual worker?—You mean, if we did away with all custom and sentiment?

1763. I want to try to find out how far he can go? —He could act as a blacksmith, fitter, carpenter. There are coloured people in the Cape who do exactly the same trades as white people.

1764. There is no legislation, is there, to prevent the employment of the coloured worker in those capacities to-day?—No legislation that I know of except that we have mentioned. It is custom.

1765. Is this custom insuperable? If these workers are capable of being profitably employed, both by the company and themselves in the occupations you have named, why is it that up to now so few of them are so employed?—On account of custom and sentiment. It is nothing but prejudice. In outside districts where we have not this prejudice you will see native blacksmiths and carpenters at work—in Rhodesia, all over.

1766. Where a company that is up-to-date and well managed, as we know these companies are, if I may be allowed to say so, recognizes that it is mere prejudice that forbids the utilization of these men in these occupations, is there no one prepared to lead the way? —And have the results of another July and January strike (1913-14)?

1767. That is the alternative?—As far as I know.

1768. That is the barrier that holds the employer back?—That is about it.

1769. **(Mr. Tatlow.)** In regard to the shortage of white labour, do the sons of white miners follow their fathers' employment?—I am afraid they are not keen to follow the employment of miners. Wherever we can, we give the sons of our workpeople the first chance of employment as apprentices, but very few adopt the profession of their fathers, as far as mining is concerned. They generally put them in the carpenters' shop or the fitters' shop or to surface work.

1770. One would have thought that it would be the natural thing for the son to follow the father's employment—but, perhaps, there are reasons that tell against it. Is it that they do not like manual labour?—Underground there is not much manual labour. I think it is the scare of miners' phthisis.

1771. You think you could take more boys as apprentices than you do?—Yes, we could take more. We have some learners now. They are not necessarily the sons of employees, but young men who come from other districts.

1772. In regard to that question of amalgamation, in addition to the advantage of saving the expense of recruiting, would it not have the further advantage of diminishing the tendency of the white workman to remove from one point to another?—Yes. But the amalgamation referred to previously was that of the recruiting organizations—not of the mining companies.

1773. I think you said you had in your mind many disadvantages which would result from amalgamation of the companies. But you did not say what they were. You said there were certain objections to the amalgamation of the mines?—**(Mr. Neuhaus.)** No, I think not. I think the question was whether amalgamations had been successful, and I think they have been.

1774. In regard to those mines that are not paying dividends, do they pay interest on the debentures and depreciation, and so on?—Well, the figures are that last year the non-dividend paying mines produced the following results. Their tonnage crushed was 6,300,000 and the output 4,075,000*l*., with a working profit of 529,000*l*., which would either go into the mine in the form of development and capital expenditure or be carried forward. And if they had debentures they would pay interest on them. You must remember, in regard to those mines, that it does not follow that because they only earned that small profit one year that next year they might not have done better. I have in mind one mine which was in low water three years ago and has now turned out an extremely promising proposition. I have figures for 1911 which show a worse picture than this. They show that 30 per cent. of the total costs were on mines not paying dividends, and now it is only 15 per cent.

1775. **(Sir Jan Langerman.)** I want to refer to the question of stores on the mines. I want you to make it quite clear what they signify. You know before the war, under the Gold Law every digger had the right to peg off a stand on his claim?—Yes.

1776. Now, those stands are still in existence, and most of them have stores on to-day. They are not included in the concession stores. Then, also, the mines had the right at one time—or thought they had the right—to let out pieces of ground for the purpose of trading. The mines had it in their own hands because they thought they had the surface rights. Then a judgment was given against the mines where the surface rights were held not to be in the hands of the mines but in the hands of the Government. Then the Government had to cancel all their stores on

the different mines which had been given out and take control of them, because the Government possessed the surface rights. Is that not so?—I cannot confirm it because I do not know the history.

1777. Well, that is the history of the origin of those stores. It is as though the Government had the monopoly, but is it not a fact that if any one can show that the population in any mining area has increased to a certain extent any citizen can go to the Government and say there is room for another store, and the Mining Inspector can visit the place, and if he is satisfied there is room they can allow another store to be opened?—He first of all goes to the mine and asks if they have any objection.

1778. Yes; but the existing storekeeper has no monopoly?—Not necessarily.

1779. He always has the chance of another store being put there?—Yes; but I do not know whether the mine has the right of veto. It has certainly the right of being heard.

1780. So there is no monopoly on the part of the Government?—There is a monopoly to this extent, that it is not open for everybody to open a store.

1781. And then also, according to the law, no miner or any official on any mine can start trading on a mine?—That is so.

1782. So the mines have no interest whatever in carrying on trading on the mines?—That is correct.

1783. Now, we heard about the instability of white labour. Have you any figures to show how many miners, or how many workmen, are thoroughly experienced on the mines and how many are not?—No; we have no figures.

1784. I want to find what is the percentage of inexperienced men to experienced men that move about from mine to mine?—With reference to your question, I would refer you to page 125 of the statements given to the Economic Commission, where we show the number of white men engaged and discharged in December last, and we segregate them into different classes. We show the total number engaged was 1,984, the total dismissed 988, and left of their own accord 891, and the average number working during the month was 21,064. So the percentage of those discharged to the number working was 8·92 per cent. Splitting it up between underground and surface men, there were 13·77 per cent. underground, and 3·88 per cent. surface.

1785. Mr. Way will be able to tell us whether the migration goes on among inexperienced men or among efficient men?—**(Mr. Way.)** I can only answer by giving a short general statement on the whole position as it appears to me. I believe that the changes which take place on the mines, among the underground men particularly, are, as Mr. Neuhaus has said, due to the running after the big cheque, and the big cheque is a consequence of the flat contract system. In my opinion, the big cheque will also be a consequence of day's pay plus bonus system. The position is that, owing to the scarcity of white miners here, we have to take on practically anybody who offers himself for that class of work, but we protect ourselves, in the first instance, by taking on as many as possible as learners, and, as you know, there is the Wolhuter School, where these men are trained officially. But men are taken on as learners who have not been to the school and go into the mine, and all they know is the shaft they go down and the crosscut and drive they go along to get to the working place or the stope where they have to work. In six months this man, who has never been down a mine before, considers he has learned his business. He has been given a machine and taught how to use it by a more experienced miner, and he is getting about 6*s.* or 7*s.* a day to begin with. At the end of six months he may be earning 8*s.*, 9*s.*, or 10*s.* a day. But he sees in the next stope or down the drive where he is working there is an experienced man on contract work who is earning 2*l.* a day and perhaps more, so he goes to his immediate boss and says, "I am just as good a man as so-and-so and I want a contract." Now, there are two courses open to his boss, either to give him a contract or to tell him he cannot have one and he must go on day's pay, and allow him a little more a day. If he does not get the contract, he packs up and goes off to an adjacent mine. He has his discharge ticket, showing that he has worked for such and such a time on a certain mine, and as he has a certain amount of experience and wants a contract he gets it, and on the flat contract system he comes out at a loss probably. As a rule, the miners never pay losses, but in some cases the loss is made up and they get something to boot. The miner finds he has not made a big cheque. He blames the manager, he blames his boys, he blames his drills, he blames the machines, he blames the compressed air, he blames the surveyor for measuring him up wrongly—in fact, he blames everybody but himself, and out he goes to another mine. Now there is a large number of these gentlemen wandering up and down the 60 miles of these fields, and they are increasing rather than decreasing, because the conditions here are such that a man will not take the trouble to learn his business. He thinks he can learn in six months what it takes the average man in other countries three or four years to acquire. I do not know what is the cause that he imagines he can learn it so quickly. Well, we are at the mercy of these men, because we have not enough efficient men to take their places.

1786. What do you think the percentage underground of efficient men is to the total employed?—Very much less than twenty years ago. The same question was put to me by the Economic Commission, and I had to reply by giving my personal experience. In a mine where one has been accustomed to go down—as I have for eighteen years—in the old days when I went down that particular mine there might perhaps be five or six men out of 200 whom I would have liked to dismiss or have "told off." Well, going down that same mine to-day I should like to sack half of them. Now, that is the only way I can give it to you; statistics will not help you.

1787. Now you referred, Mr. Neuhaus, to the number of shifts lost through drink on the part of natives. Can you give us the number of shifts lost through drink on the part of white men?—No, I am afraid not.

1788. You said you only kept figures for natives and not for whites. Of course, you know drunkenness is rife among the large proportion of the white miners?—**(Mr. Gemmill.)** The reason we keep such figures for natives is because the Government requested it, with a view to ascertaining whether the illicit liquor traffic is increasing. That information is furnished to the Government each month.

1789. I think it would be instructive if you kept statistics of the number of shifts lost by white people. Now the mines do not provide a sinking fund in cash to be set aside against the closing of the mine eventually?—**(Mr. Neuhaus.)** No.

1790. Everything is distributed in profits?—They may not distribute it all. They may keep a reserve to carry forward.

1791. But is that customary?—I think nearly all mines have a carry forward.

1792. Yes, but the book balance does not represent cash in hand?—In many cases it does. I got out figures three years ago, and I found a very large proportion was there in cash.

1793. What does your miners' phthisis contribution amount to per ton?—**(Mr. Gemmill.)** The actual cash contribution is between 4*d.* and 5*d.*

1794. That is a large item in your working costs?—Yes.

1795. I should like to have your opinion about amalgamations, Mr. Neuhaus. It has been said before that the amalgamation of certain groups in the past has not been very satisfactory from the point of view of the country, the shareholder, and the worker. Would you tell us your views—if you were to amalgamate the whole of the mines on the same system as you have amalgamated the smaller units, whether it would have the same effect?—**(Mr. Neuhaus.)** It is a question in respect to which whatever I said would be given as my individual opinion. It has not been considered by the Chamber at all.

1796. What is your personal view?—I should say, looking at it superficially, that it must be to the benefit of the shareholders, and probably ultimately I think it would be to the benefit, from an economic point of view, of all parties concerned in the matter.

Johannesburg, 2 April 1914.] Mr. Hans Neuhaus, Mr. Edward John Way, M.I.C.E., M.I.M.E., and Mr. William Gemmill. [*Mining and Mining Conditions.*

1797. Of course, scientifically, there is no insuperable objection to amalgamation as regards the administration of the mines?—Are you speaking from an engineering point of view?

1798. Yes.—**(Mr. Way.)** There would be no engineering difficulties whatever in the matter. In fact, amalgamation would overcome a great many of the engineering difficulties.

1799. So that it would be an advantage, in many respects, if a scheme like that came about?—I could not say. I only speak from an engineering point of view.

1800. The engineering difficulties which you say would also be overcome would be in the direction of economies?—Absolutely. **(Mr. Neuhaus.)** I should like to say it is a question which requires very wide consideration. Quite superficially, one would think that as small amalgamations have proved successful, bigger ones would also be successful.

1801. Separate administration appears to lead to such a great loss in working. You fight for your white labour and native labour, and the various administrative groups—apart from the duplication of the assets, which is a great loss to the country—compete in various ways. Under amalgamation you would be able to work the mines more profitably, working those which returned the best results and leaving the others to lie fallow until you have accumulated certain funds wherewith to develop them?—Of course, that raises wide issues, and it requires very thorough study before one can express a final opinion.

1802. From a purely economic point of view, it would be a sound thing?—There is one point in regard to an asset being wasted, as you suggested. At all events, it keeps a certain number of people alive. One never knows whether a mine which is not payable to-day may not develop into a payable proposition in two or three years hence.

1803. We have heard about the life of the mines. If you adopted the principle of amalgamation, do not you think the life of the mines would be considerably increased?—Do you mean that some would lie fallow for a period and then be worked?

1804. Yes, instead of the best part of the gold being taken out in thirty years; do you not think they would last longer?—I can imagine that the production would be regularised.

1805. It is better for the country that the mines should last sixty years than thirty?—But you would be losing a certain amount in that way.

1806. The mines would lie fallow?—It depends how many whites and natives would be unemployed and in what way the market for the country's products would be affected.

1807. You assume that white people would be thrown out of employment. But would they be absolutely unfit for any other work?—I do not say so. At present I am not in a position to assume what proportion would be thrown out.

1808. Whatever proportion would be thrown out, would not they be able to get any other work?—Well, the miner, who is a trained miner, in middle life would find it difficult.

1809. I mean on the land, for instance?—I am not a farmer myself, but I presume that even on the land a man needs some experience, which he cannot gain underground in a mine.

1810. It is a very small thing, throwing a few people out of employment, because the world is open to them?—That question may easily be worth while investigating, and it might be found that these people could obtain employment adequately, but it is a matter that needs going into very carefully.

1811. As far as I can see, your only objection seems to be the throwing out of employment of a few white people who could find employment elsewhere?—I have no objection, but there are many questions that would have to be considered before one could be in a position to give a definite opinion about it.

1812. Now, in calculating the tonnage of 550 million tons, which has been referred to, does that include the tonnage in the mines below the payable limit?—No; that is only tons which could be worked at a profit on the present basis of cost.

1813. In estimating your ore reserves, you have a paying limit. What is it?—It would vary from mine to mine.

1814. What do you think the average is?—**(Mr. Way.)** From 4 to 4½ dwts.

1815. That is about 19*s.*?—No. That is the actual amount of gold, but there is extraction, 95 per cent. You may take 90 per cent. for ordinary calculation, and that leaves about 17*s.*, so if your working costs exceed that, you are working at a loss.

1816. We have mines on the Rand that have worked as low as 13*s.* 6*d.* What were the conditions that enabled them to work at that figure?—The width of the reef and the scale of operations, which made an enormous amount of capital expenditure necessary for the initial business.

1817. What tonnage below that payability would be in the mines to-day—under 17*s.* in value—which is not calculated in this 550 million tons? I could not give that.

1818. Could you not make a guess?—No.

1819. Do not all the mines give the ore reserves over and under the payable limit?—Some do and some do not.

1820. So you could not arrive at the full amount?—No, not with accuracy. The estimate of the value and the way in which the value of the ore still left in undeveloped mines is arrived at is described here—the method employed. The working costs were taken at an average of 18*s.* 8*d.*, and you must remember the cost of production is more than that.

1821. Over the whole area that you considered in regard to the life of the mines, you deducted right through the 17*s.* ore?—No—everything below that on the average.

1822. Over the whole area?—Yes.

1823. Developed or undeveloped?—Developed or undeveloped. We had to estimate for the undeveloped.

1824. Then the thirty years as the life of the mines, given by the Chamber of Mines is based on that 4½ dwts.?—It is based on the present working costs of each individual mine. We have allowed each ton in the producing mines as being payable if there were 1*d.* margin on the right side, as compared with its present working costs.

1825. There must be a considerable tonnage of ore under that payable limit in the mines?—Yes.

1826. Which would add considerably to the life of the mines if you could make 1*s.*, 2*s.*, or 3*s.* reduction in the working costs?—I would not make any statement definitely as to whether it would add considerably to the life of the mines or not, but it would add.

1827. I see your recovery value came down 13*s.* between 1902 and 1912?—Yes.

1828. Was that due to a decrease in the value of the rock or due to less sorting or wider stope widths?—I could not say. It might be due to any of those three, or all three, or any two of them.

1829. That has not been settled, then?—The sorting is certainly less than it was, but unless one examined the individual returns of each mine we could not arrive at the true cost.

1830. Should not the Chamber of Mines, as being the guardian of the mining industry, inquire into the matter and find whether the ore is deteriorating or whether it is due to ordinary mechanical causes?—It was down to 1*l.* 7*s.* 11*d.* in 1911, and that is only 2*d.* higher than in 1913, and it went up again to 1*l.* 9*s.*, so we can live in hope. **(Mr. Neuhaus.)** Practically, there has been no variation in the value per ton during the last five years.

1831. Your working costs have gone up 9*d.* or 1*s.*, have they not?—**(Mr. Way.)** No, sir. They have gone down.

1832. Can you tell me in what departments the working costs have gone down?—Management has been more efficient. On the other hand, taxation has been against us. Miners' phthisis contributions have been added on, and increased costs in regard to carrying out the mining regulations, all of which have to be charged to working; so that it shows they have gone down from a management point of view considerably lower than these figures show.

1833. There is a tendency to reduce administrative expenses on the mines?—It is not only a tendency, it is an absolute fact.

1834. So it has not gone down through the reduction of black wages?—No, it has gone down by strict economy and good management.

1835. What impression has been made on the investing public at home by the issue of this report by the Chamber of Mines?—**(Mr. Neuhaus.)** I cannot say.

1836. Has it induced them to take a pessimistic view of the mining industry?—I do not think so.

1837. Do you find it easier to get money for mining development than formerly?—Not less. For instance, the African Banking Corporation has been able to make since then an issue of stock which it has placed among its shareholders.

1838. We have a lot of dormant mines that are capable of development and want capital. Is there any tendency on the part of the European investor to put money into the mines for development?—I am not quite sure if I rightly understand your point.

1839. I want to arrive at the reason for so many mines being closed down. The general excuse is that they cannot get money. I want to know why?—Because the working costs per ton at present are too high relatively to what may be expected as the produce in gold per ton of ore of these mines.

1840. And what remedy would you apply to reduce the working costs in order to induce further capital to come here? Is it amalgamation?—The great remedy which we have put forward consistently is that referred to as the removal of the colour bar, with which Mr. Way has already dealt and in regard to which certain proposals are made in the Economic Commission's report. I would also point out that since the issue of that report two of these shut down mines have been absorbed by a mine with which Mr. Way is connected, and Mr. Way will be able to tell you if the shareholders think they can make something of it.

1841. That particular scheme has been on for five years?—Hardly as long as that, but in spite of the issue of this report it has come to fruition, and it involves the expenditure of a large amount of capital.

1842. But there are a large number of mines absolutely idle and not being worked; surely there must be some reason to give?—Yes, I am well acquainted with the subject from personal experience, and the trouble is that, on the one hand, costs, owing to the restrictions on working in various forms, are too high and taxation is too high as compared with what we may expect the mines to yield. If we got a reduction in costs, as we should do, and which we have every right to expect, I think you would find that efforts would be made to reopen some of these mines and they should be successful.

1843. We all hope for a reduction in costs, but you know it is very remote. Stores take 41 per cent.?—Yes.

1844. You know the prices are cut very fine through competition, and there is very little chance of economising on stores?—Not in prime cost, unless railway rates come down, but there has been a constant improvement in the methods of working, and it may be that we shall use less in future. Not that I would give the impression that there is any waste now. We are always advancing and, as you have heard, the efficiency of the native has increased, and it may increase still further.

1845. 55 per cent. is paid in wages. No reduction is possible there in white or black; in fact, the tendency is for wages to increase per man?—Yes. But we may get more for it.

1846. The amount for stores you are not likely to reduce, and so, altogether, it leaves a margin of about four per cent. which you think you can reduce. Do you think you can make a reduction in the four per cent. sufficient to induce the investor to come in?—Of course, if we get the colour bar removed, we can make reductions in the total though we may not reduce the wages per man.

1847. You have to pay higher wages?—We shall employ fewer.

1848. But you will have to pay higher wages which will balance?—No, I do not think so.

1849. It only leaves you four per cent. to reduce on?—No. On that basis of calculation there would not be much margin, but our basis is totally different. We spend 7½ millions on white wages and 5½ millions on coloured wages. Well, if you remove the colour bar we shall spend less on the total wages, because we shall employ fewer white men and get greater efficiency and shall not cut down the wages of the individual white man, thus achieving an important reduction in costs.

1850. So far as these mines are concerned, what is your opinion about the restrictions or regulations passed for the prevention of miners' phthisis. Are there any complaints that the companies are not fulfilling their part of the obligations? They have not come to my notice

1851. Your opinion is that the mines are doing everything they can?—Yes.

1852. In regard to the obligations put on the miners, do they carry out those obligations?—**(Mr. Way.)** They are liable to be fined if they do not. But you see they have not the incentive that the Company has to see them carried out, because they do not participate to the same extent in the taxation.

1853. But surely the incentive on the part of the worker should be greater because his life is at stake?—You have to take into consideration the peculiar human nature of the miner. I remember that it was not so many years ago when it was necessary to put up a notice in the boarding house that if a man did not wash himself before having his evening meal he would be dismissed, and many were dismissed on that account. It has been difficult to educate these men to cleanly habits. Many men are above reproach in this respect, but they have to suffer for others. One man can upset all attempts at efficiency in this direction.

1854. So there is a certain amount of contributory negligence on the part of the workman?—Yes.

1855. About the inefficiency of the white man: do you not think that the knowledge on the part of the white miner, that the black cannot compete with him, under the regulations, keeps him down in his efficiency?—Yes.

1856. If he knew that the black man could compete with him by having these restrictions removed, do you not think the white man would set himself the task of becoming more efficient?—Yes. That question is entirely dealt with in statement 14 of this report of the Chamber to the Economic Commission. **(Mr. Neuhaus.)** We also express our opinion that the removal of the colour bar would no doubt mean the displacing of a certain amount of white labour from the present mines, but the effect would be that so many more mines would be opened that the total number of white men employed would be increased. **(Mr. Way.)** The majority of the white miners employed in the mining industry acquired their knowledge here, and on account of the native being the labourer their practical knowledge of mining work is inferior to men drawn from other parts of the world; consequently, the curious and unsatisfactory position has arisen of underground overseers supervising natives who are frequently more skilled than themselves. That is what we stated in our evidence. And we quoted statistics of accidents that had occurred, which accidents took place when the native had pointed out the danger to the white man and the latter had taken no notice.

1857. So the effect of the removal of the colour bar would be in the interests of the white miner, by making him more self-respecting, and encouraging him to rise in his profession?—Certainly.

1858. I see you had in January, 1913, 23,000 whites and 200,000 coloured workers employed, which is a little over one to eight, and in December, 1913, 21,000 whites and 150,000 coloured, which is nearly one to seven. Which do you consider the most efficient ratio?—**(Mr. Way.)** I do not consider either of them efficient. There are far too many whites. But that is the most efficient standard we can attain under the existing law and the custom and sentiment and prejudice which prevail. But if you ask me if that is an efficient proportion I say it is not.

1859. Yet the mines could well have done without that 2,000 white men, as they have done?—Yes, they could do without a great many white men, but they must have them under the existing regulations. The regulations are framed with the object of employing as many white men as possible. That is one indirect tax which the industry has to bear.

1860. What is your opinion: if there had been no native labour do you think we could have worked on this scale with white labour?—Not on the present scale of wages and cost of living. That is also gone into in these statements, showing what the position would be if we had to change to white labour from black. There would be very few mines working to-day.

1861. **(Sir Alfred Bateman.)** You were asked, Mr. Neuhaus, as to the amalgamation of all the mines: have you ever considered the amalgamation of all the mines under Government?—**(Mr. Neuhaus.)** No.

1862. Is it unthinkable or economically possible?—I cannot answer that question off-hand. I have never considered it.

1863. Could you give any opinion, Mr. Way?—**(Mr. Way.)** No, I could not give any reply.

1864. In some of these pages presented to the Economic Commission you make a good deal of railway charges as increasing your costs: you say nothing about shipping freights, I think?—No, I do not think we do.

1865. That does not seem to be an element in your mind?—**(Mr. Gemmill.)** It is not a matter of great importance, I think.

1866. But as regards railway charges you say a good deal, and I gather you want more favourable rates?—Yes. **(Mr. Neuhaus.)** For our imports and internal traffic. We refer to the amount of traffic from the coalfields which are within a short distance of these fields.

1867. I do not gather whether you ask for preference over other traffic?—No.

1868. What is the principle you consider fair? The cost on the line of traffic?—**(Mr. Gemmill.)** I think our chief point is the enormous profit made by the railways of South Africa, practically all made by supplying the Witwatersrand, *i.e.*, nearly all made on the interior lines.

1869. Is it an enormous profit now?—It is a very large profit, and, of course, it really, to a large extent, falls ultimately on the mining industry.

1870. The preference that are given are mainly to encourage the export of coal and maize?—Yes, but that is not our point.

1871. You want to be as well treated?—**(Mr. Neuhaus.)** If you segregate the figures of the various lines as they are segregated officially, you will find that certain lines comprising the railway system are worked at a loss and others at a profit, and these profits are utilised to pay interest on the capital of the unpayable lines and make up deficiencies in that direction. Well, it turns out that practically all the profit is made within this northern area. It follows, therefore, that the rates on traffic in this direction have to bear the brunt of the losses owing to the fact that the rates down there are too small. For instance, there is a considerable loss on the harbours every year. That loss has to be made good by the up-country consumers.

1872. And you think that would make a big difference in your costs?—Yes, we are sure of it—directly and indirectly.

Johannesburg, Friday, 3rd April, 1914.

Mr. R. Shanks, Inspector of White Labour, called and examined.

The following letter was submitted to the Commission by the witness:—

Sir,

(1.) My duties as Inspector of White Labour consist:—

(*a*) in receiving and registering applications by employers and employees for the appointment of Boards under the Industrial Disputes Prevention (Transvaal) Act of 1909.

(*b*) corresponding with parties to disputes and arranging for the sitting of boards when such are appointed by the Minister.

(*c*) receiving and filing all reports and recommendations made by boards.

(*d*) keeping a register of all particulars and documents relating to disputes and investigations in reference to same.

(*e*) supplying information to parties to a dispute concerning regulations or proceedings under the Act, and furnish parties to any dispute with the prescribed forms.

(*f*) keeping a register of unemployed white persons with full particulars regarding their occupations.

(*g*) registering all Private Registry Offices on receipt of prescribed fees; prescribing fees chargeable from employers and employees by private registry office keepers, and inspecting the books of such registry offices.

(*h*) establishing branch labour bureaux where required.

(*i*) investigating cases of unemployment amongst white persons.

(*j*) investigating complaints by or on behalf of white employees.

(*k*) making reports from time to time on labour movements, and the conditions of labour, whether in the Transvaal or elsewhere.

(*l*) supervising the conditions of apprenticeship in any undertaking, trade or industry; and other matters affecting white labour.

I mention the above in a condensed form, which may guide your Commission to some extent as to the points with which I am more or less conversant.

(2.) The term "Inspector of White Labour" indicates the existence of a type or class of labour in South Africa other than white, which your Commission will readily appreciate as forming one of the greatest problems this part of the Dominions is confronted with.

In European countries all labour is performed by white people. In South Africa, until more recent times, the white population came in in driblets, always finding a sufficient number of natives willing to perform work for small remuneration. The white race readily apportioned to the native every bit of disagreeable work he did not like to do himself, with the result that much of the labour considered honourable in other countries has come to be looked upon as degrading in South Africa.

It is needless to pretend that all occupations are or can be considered equally desirable, but the reluctance to perform labour so readily undertaken in other quarters of the globe by the white races has been encouraged to an unreasonable extent. The unskilled white worker, even in straitened circumstances, will refuse to do work, because he considers it Kaffir's work.

The skilled tradesmen were supplied with natives to carry his tools, and to lift, turn over, &c., and render other assistance in things he was accustomed to do, and did without difficulty, before coming to South Africa.

The employers of labour, too frequently, whether from environment or a desire to have cheap labour trained for future exploitation, encouraged the prevalent custom so easily acquired, by telling the white men that they should regard themselves as the "aristocrats of labour."

The skilled miner discouraged the white labourer in the mine who plied the pick and shovel, or pushed a trolly on the rails, by telling him he ought to be

ashamed to do Kaffir work, with the result that to-day there are few, if any, white men in the mines who ever had the chance under favourable conditions to settle down to such work as a regular means by which they could earn a livelihood.

Climatic reasons have at times been offered as an excuse that the white man could not do the work as in other countries, an argument which is never applied to the skilled workman who cannot get his Kaffir to do it.

To some extent this evil tendency is being overcome—force of circumstances being the chief educator, but when these ideas prevail amongst the more recent arrivals (say within the last 25 or 30 years), what can be expected from the youth of the country?

During the earlier period referred to above we had neither the very old, nor the very young, in large numbers.

The youth was in demand and could earn easily 10*l.* or 12*l.* a month doing odd jobs as messengers, driving light delivery and other carts, &c. The income of the family being frequently good, future prospects were neglected. Now, it is difficult to get young lads to settle down to learn a trade, partly through restlessness and objection to discipline, and often because they expect to get a high wage while learning a trade.

It is only in recent years that indentured apprenticeship has had any recognition in the Transvaal. "Learner" took the place of "Apprentice," and he was free to leave one employer and go to another at will, and the employer could dispense with his services with the same freedom. Thorough training could not take place under such loose conditions.

(3.) It has frequently been complained that men working on the mines are merely birds of passage; that they do not settle down in the country for good, and that their wives and families are left in other countries. There is truth in the statement, but it is not altogether to be wondered at.

Change of manager, or change of foreman, not infrequently upsets the best calculations and intentions of workmen regarding their families and domestic arrangements.

A complete change of the working staff has taken place on some mines within a month after a new manager has assumed duty.

If "a fool must now and then be right, by chance," it surely follows that out of 100 or 200 men on a given mine a considerable number of them were better fitted for their billets than their superior who discharged them, as in all probability they found employment on some other mine as efficient workmen. I have known men ordered to go to the office for their cheques for the most trivial reasons, when another man was waiting and aware that someone was to be discharged.

It is not to be wondered at that men with families are unwilling to risk the dangers to be encountered where insecurity in employment is ever confronting them.

One has only to judge the feelings of a contractor in the mine having to quit on 24 hours' notice; his work is measured up in his absence and another man starts in his place where he left off.

To dispute the correctness of the measurement is out of the question. He had to sign an agreement to quit his work on 24 hours' notice, and his home (if on the mine property) within 48 hours after dismissal. This often implied removal of families to some temporary abode until work could be found elsewhere, which might only be found at the extreme end of the reef from which he had been ruthlessly discharged.

These conditions which had to be signed on employment may not have been rigidly enforced on all occasions, but they hung over the head of the victim with certainty that he had to break up his home, with his children's education interrupted and set back as a result.

Under such circumstances none can affect surprise that men think oftener than twice before sending for their families to settle on the mines.

This question is now receiving more attention by mining authorities than formerly, and it must redound to the benefit of the shareholders as much as to that of the workmen.

It is claimed that the mine employees are a shifty and restless lot, but it is not a common failing with the married men; even if it were so, the effect, whether produced by the employers or employees, is demoralising.

(4) "Piece" or "contract" work on the mines has been the cause of more ill-feeling between employers and workmen than perhaps any other custom.

Many of the workmen are unable to measure and calculate the value of their work, even approximately, and whether right or wrong they have certainly had some harsh experiences. Men with good and proved ability working for a whole month and then coming out in debt cannot be expected to preserve a pleasant temper. The contract system was long in favour by most of the miners, but there are now an increasing number who favour the "living wage" at a fixed rate on a day's pay.

Some undoubtedly make big money and are ambitious, often to their own destruction.

When the conditions underground were very inferior to what they are now in regard to sanitation, ventilation, water and the supply of sprays for allaying the dust, the men were as careless as any of the employers. In their anxiety to have big returns they would rush into the working places after blasting operations when it was dense with dust and dynamite fumes. For this the tales of phthisis tell. In such a dangerous calling contracting tends to encourage risks from what pass as accidents—a temptation which should be discouraged as much as possible.

It is all very well to advise men to be careful, but even when the work is known to be hazardous the temptation remains to take risks where success is expected to increase the income. A reduction of the toll from accidents and phthisis might have more than balanced the gains to miners and mine-owners by the adoption of a rational day's pay in preference to the contract system.

(5) At present it would be unwise to predict that capital expenditure on public and private buildings, and on construction work on the mines, could be continued on a scale equal to that which has been maintained during the past five years, but it must be recognised that a considerable number of those who have recently taken to the cultivation of the soil have been men possessed of considerable means, if not living in affluence, and the price of land has greatly advanced.

The amount of capital required to start farming on a moderate scale in South Africa would be regarded as comparative wealth in other countries, so that the humble class who would take to the land are, without assistance in some form, very much restricted.

Very few are able to build a house, construct a dam, purchase cattle, implements, and seed; plough, plant, and reap without a fair reserve. Disease, blight, and drought may not exceed the difficulties encountered by farmers in other countries, but where the original outlay is higher than in most countries, a season of disaster is more difficult to recover.

I shall be pleased to reply as best I can to such other questions as your Commission may direct.

I have, &c.,
R. Shanks,
2nd April. Inspector of White Labour.

1873. **(Chairman.)** You are Inspector of White Labour?—Yes.

1874. Is that a Government appointment?—Yes.

1875. Which you have held for how many years?—Six years.

1876. And that gives you an intimate acquaintance with the labour conditions here, so far as they concern white labour?—Yes.

1877. I won't trouble you to read the whole of your memorandum, for which we are indebted, but I will

ask you certain questions upon it. First of all, in regard to the Labour Bureau, which is under your supervision, how far has that been a practical success?—Not very far.

1878. Why?—Simply because the employer does not take any advantage of it and says he does not require it nor feel the necessity of it. In other words, he acts without applying to the Labour Bureau. That is the large employer.

1879. What is the result of that system? Is it detrimental to the interests of the white labourer?—It simply means that white labour must roam over the country looking for employment.

1880. Is white labour engaged at the different mines?—Yes. They have men coming round every morning asking for employment.

1881. Who deals with that?—Usually the mine captain for the underground staff, and they have men in the different departments such as the engineering, the carpentering, and so on. That comes under the surface manager.

1882. So the man who is out of employment has to go the different rounds?—Yes, practically.

1883. There is no central office?—Yes, but it is not taken advantage of.

1884. That is to say, if he applies there it does not improve his chances of getting employment?—No.

1885. Do you attribute the instability which exists among white labour to that?—It is certainly one factor, and an important one, in my opinion, because if a man wants employment it simply means that he has to go from one place to another to look for it.

1886. I do not ask you to give the figures in regard to the very rapid changes from mine to mine of white labour, because that is a matter of public notoriety. But what is the main cause of that in your judgment?—It is caused to some extent you will find, as in all large communities, by a certain number of shiftless people continually moving from one place of employment to another. But I think it is very much increased here by the very unreasonable way, I should say, in which the men have been dismissed from their employment, on some trivial pretext or other. They dismiss men without very much cause on the mines.

1887. Who has the right of dismissal—the manager or the mine captain or the miners' boss down below?—The mine captain and the mine foreman very often do it. I think it is being improved now, but it used to be very prevalent.

1888. What is the system which is being adopted now?—I know in some mines instructions have been given to managers that they must see to the actual dismissals.

1889. Can you state at all the proportion of these men who shift from mine to mine and how many leave the mines of their own accord, and how many are dismissed?—No, I could not tell you that. The only thing I know is the information which was obtained by the Government Mining Engineer last year when I think it was about 13 per cent. left within the month.

1890. My point is not how many left, but of those who leave what proportion leave of their own free will and what proportion are dismissed by their superiors?—I could not say the proportions.

1891. Do you consider the contract system is responsible largely or mainly for this perpetual migration?—I believe it has a great deal to do with it.

1892. Do you favour the contract system from your experience?—No.*

1893. What do you favour as a substitute?—Well I favour the regular standard wage such as carpenters, bricklayers, and others receive.

1894. Do you consider this piecework the cause of unrest and discontent?—It largely has been.

1895. Is that diminishing?—I think it is to some extent because there is far more daywork being done now than formerly.

1896. That is day's pay, or day's pay plus bonus?—Plus bonus.

1897. Now you state in your letter that the unskilled white worker, even in straitened circumstances, will refuse to do work because it is "Kaffir's work." Do you consider that is a permanent condition in this country, or a condition which is likely to be modified or changed?—I am hopeful that it will be modified and changed, but when once that gets rooted it is a rather difficult thing to eradicate.

1898. And I suppose it is rooted?—Well it is more or less.

1899. Do you expect that it will be modified?—I think myself that a number of unskilled labourers never get the opportunity to settle down to it.

1900. Where it has been tried it has been purely from an experimental point of view?—Largely. It has been done by sympathetic people to find temporary employment for men when times are bad.

1901. That is semi-philanthropic?—Yes.

1902. And these unskilled white workers find employment then at what day-rates?—When they were employed largely in the mines it was mostly at piecework rates—paid on results, either by tonnage or measurement. In regard to moving rock from the stopes into trollies and moving it to the surface they were paid at piecework rates.

1903. And when it was on day rates, what rates was it at?—There were some employed through the Bureau at piece rates. Some did fairly well and others came out badly.

1904. And those who did fairly well, what did they make a day?—As high as thirteen and fourteen shillings to my knowledge in some cases. When they did that they were cut down.

1905. You say that the white men regard themselves as the aristocrats of labour?—No, I think I said they were encouraged to do that.

1906. Then, as a matter of fact, the work they do is very largely supervision?—Very largely it is.

1907. Are they trained at all to exercise that supervision efficiently?—I do not think the training has been very much gone into here at all.

1908. That is to say, the white miner learns to do one kind of work, namely, mining with his own hands, and he is called upon then to do something totally different—to supervise others?—That is largely the case with coloured labour, of course. He is used to do the hard grafting labour.

1909. Is the kind of training which a man receives in mining itself that which is most suitable to make him an efficient supervisor of native labour?—No. I think there are many responsibilities that attach to it, besides the supervision of the white man himself, which he is not really experienced and qualified in. He may be qualified to manage a number of Kaffirs and tell them what to do, but in the mining itself I think a great deal is to be known apart from the directing of the natives.

1910. And similarly he might be a very good miner and a very bad supervisor?—He might.

1911. What is your view of the operation of what is termed the "colour bar"?—In what respect?

1912. That is to say, certain definite employment being reserved either by law or feeling to white men and certain other employment to natives?—I think myself that the colour bar should not act—that there should be qualifications recognised and established, but when it comes to the native as a whole I think it is quite right that there might be a colour bar, simply because you have a serious difficulty in finding out where responsibility could be put down to men safely.

1913. This view, that certain employments are what they call "Kaffir's work" is practically an inverted colour bar—it reserves certain employments to natives?—Yes.

1914. Whereas other employments are reserved to white men?—But largely, I think, in regard to responsibility that is looked for in regard to administration.

1915. In view of safety, do you mean?—Yes.

1916. How far do you think that is either desirable or necessary?—Well, with a black population so ignorant in regard to many things connected with industrial employment, I think difficulties would be presented very often by having men appointed to positions that they were altogether unqualified for in the same way as white men might be to a large extent.

1917. Then you regard it as rather a question of individual qualification?—I do.

* See Appendix VI., p. 110.

1918. It depends on the qualification of the individual and his ability to discharge certain functions. You say something regarding apprentices, the number of apprentices being trained is very small?—On the mines it has been extended considerably of late, but outside the mines it is not in existence to any great extent.

1919. Why is that?—Well, there are various reasons, of course. Coming to carpentering work, for instance, they maintain, and I think rightly, that you may have a boom in trade and times very busy, and then have a collapse, and you have a difficulty in finding employment to keep the apprentices going at a time when trade is dull. They are unable to make doors and windows in consequence of an unlimited supply from oversea, and the building trade particularly claims that they should have protection in order to go into the manufacturing question with safety.

1920. Taking a large and long view of the interests of the white workers in this country, is not the absence of apprentices a danger?—I think it is. It means that we shall always have to import men from oversea, and youths are growing up without skilled occupations.

1921. Then what occupations have the sons of the white workers here?—They have occupations in connection with the mines. The mines, I believe, give preference to the sons of men working on the mines and in the workshops.

1922. But those men, you say, do not become skilled?—Well, they have to go through the apprenticeship course. That is limited, of course. Take a carpenter. He would be doing mining work principally, and he would not be much good for other work. In other work he would be a rough carpenter mostly.

1923. Looking to the future of the present system, are capable white workers being trained up to make a good career for themselves and become efficient?—In some cases it is extremely limited—to the extent that a youth, if he enters a trade, is often not bound by any indenture and he can leave if he thinks he can earn a shilling or two more, and, similarly, the employer can dismiss him.

1924. Is not that detrimental to the interests of both classes?—I think it is.

1925. How do you suggest it should be remedied?—By a healthy public opinion in favour of the indenture system and conditions being favourable to the employment of young men. I do not say that you can do it by law: no one is required to indenture himself by compulsion.

1926. Now, you say that a man has frequently to quit a mine on 24 hours' notice—a contractor. His work is measured up in his absence and another man started in his place where he left off?—That is quite common. The agreement in the case of all the mines is practically 24 hours' notice.

1927. Do you suggest that it would be preferable and practicable to have longer notice?—Yes, I think it would. I think that when such short notice as that exists, there is a great tendency to put it into operation needlessly.

1928. The longer notice would be reciprocal?—I think it should. I do not refer to insubordination, of course. You must have discipline.

1929. Would a longer notice be favoured by white labour?—I think it would.

1930. And what would be the view taken by the mine managers?—That I would not be prepared to say, but I am sure it would have a more steadying effect.

1931. And you think it would be fairer to the worker?—I think it would. I think that by the time the notice expired perhaps they would find out that they had really made a mountain out of a molehill, and there would be no dismissal at all.

1932. That is to say in cases where these dismissals are due to fits of temper?—A good deal is done in that way.

1933. And you would say that many employees who are called shifty and restless would be steadied by it?—I think it would have a steadying effect.

1934. Now at the end of your memorandum you speak about the amount of capital required to start farming on a moderate scale in South Africa. Is it the case that any considerable number of white workers on the mines, after they have made a little money, or otherwise, go in for farming?—There is a proportion, though it is small, I think. There are more people leaving the farms and going into mining and railway work.

1935. Why is that?—A large number of people on the farms live in very humble circumstances, and I think the attractions connected with the active life has something to do with it, and they are better off in many cases than they could be on the farms.

1936. Can you say whether health conditions in the mines have been very largely improved during the last two years?—I do not know that I could say the improvement in health has been shown particularly during the last two years, because the effects of previous improvements have not shown, but I do think the mines are very much better than they were.

1937. You would expect the ravages of miner's phthisis to diminish rapidly in the near future?—I think so—not speaking as an expert, but simply as an observer.

1938. And you have opportunities of knowing. You visit these mines frequently?—Yes, occasionally.

1939. Do you think the conditions which prevail now are satisfactory as regards the health of the miners?—I think they are doing pretty well, as much as can be expected. I think they are carrying out all reasonable suggestions that have been made as far as possible. If there is anything else to be discovered I think they would be inclined to adopt it, too.

1940. The spirit of improvement is there?—Oh, certainly.

1941. **(Sir Jan Langerman.)** Does that improvement refer to the workmen as well? Do they observe the regulations laid down for the prevention of miner's phthisis?—Not always.

1942. So they are really contributing towards the upkeep of insanitary conditions?—They have been contributory to it in many instances.

1943. Now about the standard wage—I suppose you will admit that there is a great distinction between skilled workmen as to the quality of their skill?—All over the world.

1944. But we are referring to this place now?—I do not make any exception.

1945. There is a large difference between men in regard to the quality of their work?—Yes.

1946. How would you fix a standard wage? Would you need a grade of standard wage according to capability?—That is always judged in cases where the standard wage exists by the capabilities of the worker. It simply means employing a man who comes up to the standard requirements.

1947. But is there such a thing as a standard task at all? Is there a standard task set down as a *quid pro quo* for standard payment?—Yes; there is the average amount of work that can be expected to be performed for an average wage.

1948. Suppose we fix the standard wage for an ordinary mechanic at 20*s*.?—Yes.

1949. A good mechanic would get that and a bad mechanic would get that?—Not necessarily. He would be required to come up to a certain standard and give a certain return in the shape of work.

1950. Then it is in the opinion of the manager of the employer as to whether the return is up to the standard, and he must say whether that standard is fulfilled or not?—Yes.

1951. Then if the man is sacked he has no complaint?—Quite so. It simply means that he is inefficient.

1952. Then why should an inefficient man get a longer notice than 24 hours?—It would depend, if you were to dismiss him on 24 hours' notice as being altogether inefficient. I do not think I applied it in a case of that kind. You might discover a man to be inefficient in two hours. I do not say it applies there, but where you have men that have shown they are capable over a certain period, and then, perhaps, on account of some trivial matter those men are dismissed at 24 hours' notice.

1953. Then you would not attempt to interfere with the right of an employer to dismiss a man summarily if he did not come up to the standard?—Not at all, if it were simply a question of discovering that a man was inefficient.

1954. So that in very isolated cases, then, a longer notice should be required?—I think that after a man

has been taken on, for instance, for a week, or a month, they should be able to find out during that time whether he is qualified or not, and after such period as that he should receive a little more consideration.

1955. But is it not the habit of men during a time of probation to work hard and then slack off?—I take it that most of the supervisors of labour have a knowledge of what can be kept up.

1956. Well, having passed that seven days' probation, you claim that a man should have longer notice?—It depends what you mean by slacking off. That has a very indefinite meaning. It might mean a slacking off that would be hardly perceptible and it might mean loafing.

1957. Well, it would not be to the interests of any employer or a company to dismiss a first-class workman out of sheer wantonness, so to speak?—My point is, that it has been done, and at the present time it is regarded as right to be done.

1958. But would an employer do it in that case against his own interests?—I should think not.

1959. So that if they do dismiss a man, presumably there is some good reason?—Yes.

1960. Here, you say, the employers desire to have cheap labour trained for future exploitation. What do you mean by that?—I think there is a context.

1961. "And encourage the prevalent custom so easily acquired, of telling the white men that they should regard themselves as the aristocrats of labour." That is a little bit of padding, is it not, because no employer to my knowledge has ever told a workman that he must ride the high horse because he is an aristocrat of labour?—It has been done.

1962. But what do you mean by "having cheap labour trained for future exploitation"?—There is apparently a feeling on the part of the employer that it would be far better if he could have natives skilled in every department and skilled white men to teach the natives to become skilled, so that when they were skilled he could dispense with the white men's services very largely and deal with the native, who is very docile and not particularly given to organisation or standing up for his rights and for a higher standard of life.

1963. Looking to the interests of the employer, do you not think that the employers would have a perfect right to employ the black man, who belongs to this country, if his work is as good as that of a white man who offers his services at a higher rate?—He is doing it now.

1964. And do you not think he is perfectly justified in doing it?—He is justified in doing it so long as he can get equal services, but, of course, he does not care to pay equal money.

1965. You have had a lot of people passing through your hands from time to time applying for employment, and you visit the mines very often, too. Do you think that something might be done to stop a great deal of the insobriety which exists among white miners?—It is a very difficult thing. Personally, I am a teetotaller.

1966. It is a sad thing that there is so much insobriety, and do you not think something could be done by the employers and also the Trades Unions to try to minimise that evil?—To my mind it is more a question of education, not in the ordinary acceptation of the term, but as to the advisability of leaving liquors alone.

1967. But there is no chance of teaching them to be moderate. They will either go the whole hog or none at all?—As long as liquor is freely sold there is a difficulty in finding a lode line.

1968. Would you advocate local option on the mines as regards the consumption of drink?—I favour it myself.

1969. You think that if local option could be carried out on any mine the miners, for that reason, would not leave that mine?—I think local option should cover a considerable district. I do not think you could apply it to an isolated mine.

1970. But what I mean is this. You know the canteens are distributed along the reef and the miners can get as much drink as they like, and apart from that they have the system of the bottle store?—Yes.

1971. These bottle stores have free access to the mines and to every married and single quarter. They take orders and they fill the single rooms of the men with cases of whisky?—Yes.

1972. They get paid at the end of the month. On Saturday the man starts with a case of whisky and goes on drinking all day Sunday, and does not stop until it is finished, and he is absolutely incapable on Monday morning, and often on Tuesday as well. Do you not think that if that were prohibited on mines it would have a better effect on the morale of the men?—Well, I prefer local option rather than prohibition.

1973. I mean the mine should be able to say these bottle stores should not have access to the mine property and not allow them to sell cases of whisky and leave them in the rooms?—I do not know how that would work. I think a man would simply order the stuff from the bottle store and would get it just the same.

1974. That is the custom at the present moment, and it is most demoralising to the men, as well as disorganising the work of the mines?—Yes.

1975. Can you take any steps or make any recommendations in regard the facilities which these bottle stores have of visiting the mines and selling whisky on credit? Even the fact of selling for cash might also have a deterrent effect, but at the present time they are allowed to sell on credit, and when the cheque comes at the end of the month they grab that cheque?—I think if the credit system were not recognised in the law courts it might have some effect.

1976. **(Sir Alfred Bateman.)** As regards the system of Labour Bureaux, where is the Central Labour Bureau?—Here, in this building.

1977. Is it much used?—To the extent of about 200 or 300 a month, even at a time like the present.

1978. From my personal experience of Labour Bureaux in England, they did not get much patronage from the masters until they canvassed them all. The Manager of the Labour Exchange saw the manufacturers and employers. Has that been done here in regard to the mines?—So far as the mines are concerned, I think it was done, and at the time the system was started we had very valuable assistance from Sir Lionel Phillips, who took a great interest in the organisation about six years ago. Quite a number of men were employed underground at that time on work which is usually regarded as Kaffir's work. It was advertised as well as it possibly could be, and it is well known at the present time, but I must say that the white labour referred to was discontinued.

1979. This Bureau is only for white labour, I understand?—Yes.

1980. Does the Bureau take any notice of the wages which are paid to the workman, or simply put the man in communication with the employer?—No. In all cases we endeavour to find out what the wages will be.

1981. Would you let a man go at an unfair wage?—We have no means of preventing that. A man may take anything that is acceptable to him. But where it is a case of disturbance, or labour disputes, or anything of that sort, we have nothing to do with it; we never send people out where there are disputes without letting them know.

1982. You take the same policy as is followed in Great Britain?—Yes, in that respect.

1983. What is the attitude of the trade unions to the Labour Bureau? Do they like it?—As a rule, they practically act as a labour bureau for themselves. It is only natural that the trades unions should find employment for their own fellow members. Very often it is known that a place is to be vacated, and some union man is sent along to fill it. They have always a certain number of union men idle and they naturally advise the officials of the society.

1984. This office is not used by the Trade Unions?—No.

1985. In England many of the Labour Bureaux are used for meetings of the Council or joint meetings of the trade unions, and sometimes for workmen to keep their tools at. There is no such thing here, I suppose?—No.

1986. That has been found to bring the trades unions very much into line?—Yes.

1987. I suppose it is not wanted here?—No; they have their own halls.

1988. In England it was mostly a case of meeting in public houses at one time?—As a rule, I think, they meet in their own private halls in this country. In Johannesburg they have the Trades Hall.

1989. Then you referred to the practice of sending people away at 24 hours' notice, and I gathered from you that you were of opinion that if there were longer notice a man might not go at all?—I said I thought it would have a steadying effect.

1990. Is temper short here? I mean has the climate anything to do with short tempers?—I think temper is perhaps modified in some ways here more than in other places.

1991. I was referring to the altitude?—I do not think it makes much difference. I have seen as many fighting temperaments in the Old Country as I have seen here, I think.

1992. As regards the question of drink, and supplying it to these white miners, do you think it would be possible to label a man, so to speak, and mark him as a man who is not to be supplied with drink?—I think there is something in that. I believe that principle exists in England now, where a man is shown to be a habitual drunkard.

1993. Yes; he is not able to obtain drink?—So I understand.

1994. Do you not think that would be better than stopping all the moderate drinkers from having their glass of whisky?—Perhaps so.

1995. You say apprenticeship has rather declined here. But is there not here, as in England, a modified apprenticeship, where they are not bound for any period?—Yes. I think they are beginning to recognise to some extent that is a mistake, as they are in America. I understand that in America they are finding it increasingly difficult to find superior men capable of taking charge of different departments, because they are not fully trained. The men are simply accustomed to do a particular class of work and nothing beyond that.

1996. **(Mr. Sinclair.)** There is something as to which I should like to get an explanation, if possible. The employers tell us that white labour is unstable and shifty—that it moves about after the big cheque. You suggest, if I understand you aright, that the arbitrary treatment by the mines of these men accounts, to some extent, for this moving about. That seems to want reconciliation, does it not? One of those attitudes cannot be absolutely correct. What have you to say as to that, bearing in mind that the employers want the labour?—I think it hangs largely on the colour question. It is well enough known by every one who has lived long in the country and seen the effects of coloured labour that you can deal with coloured labour in a very much harsher way than with white labour.

1997. But if the employer wants men badly, does it not seem inconsistent that he should treat them so harshly that they will not stay? That is what your view seems to suggest to my mind, and that is what I want to try to reconcile?—The native is very easily managed in that respect, and he can be treated pretty roughly. Rough treatment that he will stand will not be put up with by a white man; and the overseer—the white man—has a preference for the coloured simply because he can boss him up. I think that is it.

1998. But does he get in that way the class of labour that it is suggested he wants?—I do not think he does.

1999. You see, what is in my mind is the unlikelihood that the employer who wants the man will treat him in such a way as makes it unlikely that he will keep him?—I think the pursuit of coloured labour is carried on to a greater extent than would be even profitable to the employer.

2000. Now come down to bed-rock. Which do you suggest is most to blame for this—the instability of the worker, the roving disposition of the worker, or the arbitrary treatment by the employer?—Both, in my opinion.

2001. You cannot measure the portion of blame that each should carry?—No. I think they both hang on the system which has worked into the country, in my opinion, simply by degrees.

2002. And that perhaps most fairly approximates to the real position—that both are to blame?—Yes.

2003. Now I gather from your evidence that you do not favour the contract system?—No.

2004. If I understand you aright, you suggest that the contract is often used to cut down wages, and when it is known how much a good worker can earn under the contract system, the daily wage previously paid for that work is cut down. Is that what you wish to convey?—It is thought that is so.

2005. And that is, is it not, one of the leading reasons why trades unions prefer the day wage to the contract system?—That is one of the reasons, but not altogether. It is partly a reason, I think.

2006. Now one difficulty in the way of paying a standard wage all round is that there is a tendency, is there not, to reduce the efficiency of the good worker? He is apt, is he not, to reduce his labour to the level of the poorest worker when he is getting the same wage?—That is the tendency.

2007. Could not that be met by a system which obtains in some countries of giving the less competent worker an exemption certificate, which would entitle the employer to employ him without coming to loggerheads with the union, at a lower wage than the standard wage?—Yes, that is done.

2008. Then, if that is done, the system of paying a standard daily wage would not seem to have any objection, and it would seem the best system to adopt?—Yes, for competent men.

2009. You spoke as to underground conditions Does it fall within the province of your office or the Department of which you are an officer to care for the underground conditions, or are they looked after by a separate Department?—They are looked after by the Government Mining Engineer and the Inspectors of Mines.

2010. In regard to bottle store licences, did I understand you to say that liquor may be freely and indiscriminately supplied by the bottle? Does the bottle licence system still exist in the Union of South Africa under which grocers and storekeepers may supply liquor in the bottle?—Not grocers—only liquor sellers.

2011. The system of selling by bottle obtains in this country?—Yes.

2012. And I understand you to say that liquor may be "chalked up" against the buyer and that the seller may sue the buyer for the liquor supplied and obtain judgment in the Courts?—Quite so.

2012A. Would it not greatly tend to minimise the evil if the bottle licences as regards stores were abolished altogether?—I think it would.

2013. And if credit given for liquor supplied could not be recovered?—Certainly, just as in the Old Country.

2014. And as in other countries as well?—As in other countries too.

2015. **(Mr. Lorimer.)** Are you appointed by the Government?—Yes.

2016. And are you under the Minister of Mines?—Yes.

2017. And do you report to the Minister such things as you have told us in this statement of yours to-day?—Yes.

2018. In regard to the arbitrary treatment of workmen and so on?—Yes; in various forms.

2019. And does he take any action?—Well, any action which is taken at the present time is largely in regard to measures which have been brought before the country and which are likely to be presented to Parliament soon.

2020. You say here that men of good and proved ability working for a whole month and then coming out in debt cannot be expected to preserve a pleasant temper?—Yes.

2021. But do such things happen?—Yes.

2022. In the case of men of good and proved ability? If a man is a competent man and works for a whole month, he must know whether anything abnormal has occurred in the work during that time and he could call attention to it?—Yes.

2023. Do you mean to suggest that in that case the man is cheated?—I can only point to the actual cost sheets that have come to my notice, where, for

instance, a man had earned for 11 months a little over 50*l.* a month, and——

2024. It seems to me impossible that experienced men could work for a whole month on a contract and at a contract price and then come out in debt without something abnormal having occurred during the progress of the contract and that they would know?—I can just tell you of a case where a man worked for 11 months and earned over 50*l.* a month and in the twelfth month he came out 50*l.* in debt.

2025. And was he a competent worker? Had he done similar work before?—He had earned 50*l.* a month for 11 months.

2026. Was there a balance at the end of each month?—Yes. I could not understand it myself at first, but I came to understand it.

2027. Now, taking the question of wages, do you advocate a day wage?—Preferably to the present system.

2028. And you say that what has come into favour is the day's pay plus bonus. I want to know how the bonus is to be calculated?—As a rule, the bonus is paid after reaching a certain amount of efficiency; that is to say, that they displace so much rock, for instance, and receive a bonus over a certain amount.

2029. Owing to the fact that the white men had no hand work, I do not see on what basis the bonus could be calculated?—One can direct operations even if others do the work.

2030. But a system of simply day's pay, without any qualification at all, and putting every man on the same footing might mean that the indifferent man would receive more than he was worth, would it not?—Well, of course, a mine does not prefer keeping an indifferent man.

2031. At the same time, even an indifferent man would probably regard himself as being worth as much as the best?—Not necessarily.

2032. Would not that tend to reduce the demand for labour if there were a minimum wage fixed and each man were able to get that? Then the mines would naturally take the best men?—I think it would increase the demand for efficient labour, and not reduce it.

2033. Now, about the training of apprentices. What are they apprenticed to?—Such occupations as exist, and they are not very numerous.

2034. You mean carpenters, blacksmiths, and so on?—Yes.

2035. Is there any technical instruction in the city?—Yes.

2036. Is there a regular system of apprenticeship?—Yes, in one or two engineering firms they have a regular apprenticeship.

2037. And do they get boys regularly to agree to undergo apprenticeship?—Yes; they are getting them to indenture.

2038. Are the boys quite willing to enter on such a system?—This particular firm I refer to have more boys than they can place.

2039. Unless the boys obey the system willingly, it will not work, but if they do it would be a good thing for everybody?—They will not employ these boys until they have put in three months' trial in the first place.

[*For an additional statement by this witness, dealing with the question of the contract system of payment of white miners, see Appendix VI., p.* 110.]

Mr. Thomas Matthews, General Secretary of the South African Miners' Union, called and examined.

2040. **(Chairman.)** Have you any official position?—I am General Secretary of the South African Miners' Union.

2041. You appear to give evidence on the subject of the position of the mining industry, and particularly in regard to the employment of white and black labour on the mines?—Yes. I can give you a statement that the Society has generally acted on in the past, but, of course, I have not sent in a written statement of their views, because the course of action taken is largely agreed to by us.

2042. You might state your individual views?—In regard to the subject of the development of the natural resources of the country, whether attained or attainable, would you like to have our views regarding the situation as it stands here now *re* black labour and efficiency and white labour?

2043. Certainly.—Well, Gentlemen, taking the point of view of the white workers, I may say that during the past thirteen years there has been continual strife owing to the encroachment of the black man on what we have always considered to be the real sphere of the white man. We had a strike some seven years ago, and the strike occurred through the industry asking a few men to run an extra large machine. The men argued that two machines were all that they were able to run efficiently. I do not know whether any of you gentlemen have any underground experience—I know Sir Jan Langerman has—but it is a question as to whether the white man should become a supervisor or whether he should be the operator himself. It is a grave question, and an economic question that we shall not be able to deal with off-hand with any degree of success; but having been in the United States when a boy, where this thing also came up, I believe that the side taken up by my own class is the right one. Now, the question is this: if South Africa is to become an asset to the Empire at large, we must try to make the Empire a white man's empire, giving those whose life and experience allows it that degree of civilisation which is equal to that of England and Australia. Otherwise, it will resolve itself into this—that South Africa, with its cheap labour, will be black and the Empire will lose South Africa, or that we must at all times hold the black man in his sphere, and give all the work we can possibly to whites, without encroaching on the sphere of the black man. In the United States, when I was a lad in Alabama, the black man became organised there into a society of his own, and he was free; and it was agreed there, and also in Montana and elsewhere, that the black man, who is of a far higher intellectual type than here, should use his intellect in so far as he could without injury to the body politic, and we asked them to organise for as high wages as they could get. Now, for my own part, or on behalf of my Society here, what we do say is this: that the mining industry or any other industry has no right to have the black man a slave as he is, and to have him under the ægis of any law, to have him to compete with us—not allowed to strike, not allowed to agitate, not allowed to be any higher than he is—a raw aboriginal. What the white artisans here ask is that, if the black man is to compete with us, the law which we make should not help him in any way as against us. Seven years ago we got beaten with our strike and had to take on three, four, and five machines. The strike of July last was on a question of longer hours, as you will have read. I do not want to go into the ethics of that, and I am afraid we have not got time, but we have been damned, I consider, through no fault of our own. We have been called hard names here, but I can assure you I think myself equal in any way to Mr. Jan Smuts or any of his satellites. Now for the Government to declare martial law and prevent us from winning the strike on economic grounds shows that, leaving out the question of ethics or first principles of Western civilisation, there will come a time for South Africa, if you agree that laws ought to be made bolstering up the Kaffir as against the white worker, when it will be of no material benefit to the Empire. If Australia can keep out the Chinamen, and they have done so to the welfare of the whole community—leaving out the equitable or rational point of view that you have the right to buy where you can, and all the likes of that—we argue that if Australia can, on long lines of sound policy, build up a nation on a high standard of civilisation, we have the same right here. Because the Kaffir is here already, we have no right to say it is his land. The Kaffir ousted the aboriginals ahead of him, and the Bantus ousted the Hottentots, and the Dutchman ousted the Kaffir, and we are now trying to oust the Kaffir from those spheres of industry which we maintain are the proper sphere of the white man. As a first principle, I agree that every man

has a right to live, whoever he is, but if those in power in South Africa intend to make laws bolstering up the Kaffir in the industrial sphere, there will be no hope for the white race, and Johannesburg and the rest of South Africa will be reduced to the same state as Basutoland to-day.

2044. How do you propose to fix the limits between the white and native worker?—Well, what we agree is this: that if the mines cannot run without Kaffir labour they have the right to hire Kaffirs. We state, however, that seeing that phthisis is so prevalent, and the Mining Regulations are so onerous, no white man ought to be allowed to run more than 25 hammer boys, or two or three machines. It is agreed in the Regulations that in coal mines one white man ought not to run 50 natives. Well, we have evidence that natives in the coal mines do such work as blasting and coal getting, and the ultimate outcome is that accidents occur, and heavy death returns are the result. On the Witwatersrand we have regulations as regards the work that natives must do, but the fact is that the way they are carried out is not satisfactory. One man told me to-day, for instance, that he has had six of these machines with a number of boys, and after setting one machine to work and going to another, the boys altered the machine and drilled into a misfired hole, with the result that an accident occurred and one of them was seriously injured, together with two lashing boys. Now the mine-owners will tell you, of course, that it was the man's fault, but if we are going to have overseers to look after 30 or 40 boys with 12 or 14 machines, they will be unable to do it, and the mine-owners will have to be responsible for any accidents that result. Because they have no right to ask men to work under circumstances where the danger is so great.

2045. What do you say is the cause of the great instability of white labour—the men leaving one mine and going to another with such frequency?—Because there is no *esprit de corps* among the body of miners, from what I can see. I have been here for 16 years. I spent 16 in America and 15 in England, and I can say that elsewhere, in England and in America, there was more of a feeling of over-lordship, so to speak, on the part of the mine-owner, and there was also more of a feeling of brotherhood with regard to the mine managers, and a spirit of *esprit de corps* among the men. Where I was in Butte, Montana, there were 20,000 white men underground, and a man could always get work under one boss for years, or if he happened to move away, he would be always taken back. Here, it seems to me, a very different state of things obtains. I can say honestly that there are some very good mine managers here, but I am sorry to say I have known of instances where a new manager has come on to a property, and has asked an artisan how long he has been there. The man replies, "Nine years," and the manager says, "It is about time you got out—you have been here too long." Well, it may look humorous, but the fact is that probably the manager felt that man had been there too long and knew the ropes too well, and he would not get the same amount of work out of him as another. Generally, the feeling on this Witwatersrand is: we want all the profits we can get, less working costs, quite immaterial as to what happens to the men or what may result. It is simply and purely a capitalistic scheme of society, where we have no function or power. In practice, they are like the Romans of old: This is English, this is Dutch, this is French, and so on, but we have no cohesion and no national spirit between us which holds us together as a race, and, therefore, the custom that existed in England, where it was an honour for a lad to follow in his father's footsteps; and where the mine manager knew the lad's father and his grandfather, and there existed a sort of mutual tie, does not exist. We do not care a hang who you are—whether black, white, red, yellow, or anything else; whether you are British, American, or German—we are going to reduce working costs, so will you do this work at this price or not? If so, we will hire you until such time as we care to dismiss you. But there is never any attempt here to form a government of the people where we can feel as brothers and settle down.

2046. What is your view of the contract system?—For the past three years, I have been arguing against the contract system, and trying at all times to get men to accept the average earnings of the Witwatersrand as their average standard wage, and to insist first of all on a reasonable day's pay—that is 25*s.* a day for machines and 1*l.* a day for hammer men. Now, we had 7,000 men in our Society in January—they are somewhat afraid now, but still they are gradually coming up again. We never discussed with the 7,000 as to whether they preferred the contract system or not, but it has been agreed on many occasions that we stand for 25*s.* a day for machine men and 1*l.* a day for hammermen, and if there should be no contract system I think they would be satisfied with that. But, still, I must say there are quite a few of our men who would like to go on contract and who will work longer hours than the law allows. Naturally, they die, and those who are left behind have to look after their wives and families. And I may tell you that on this Rand, very few white miners ever die worth 1,000*l.* I know two or three who died worth two or three thousand pounds, but in the majority of cases, and I have known quite a few, the miner after six or eight or twelve months' illness, has died of phthisis and left practically not a cent for his wife and dependants.

2047. That is due to what?—That is due largely to the arduousness of their lives underground. Very few men are temperate, because the average miner, when he comes off shift, feels the need of a stimulant, and I may state that I do not wonder at it, because when you have been down a mine for eight hours among a crowd of dirty, evil-smelling Kaffirs, working hard and using up all your mental energy, it is enough to break down the moral fibre of the average man. He feels he wants a drink, and the result is that he goes too far, and it injures him morally. I do not know that it injures him mentally, but he certainly becomes somewhat broken in his resolutions. Arising out of the question of the contract system, I may tell you that some time ago—and this is an illustration—three men came in from one mine, who had worked in the same stope, and each of them came out in debt. The Society gave one of them 5*l.* to pay the house rent. Now can you understand those men working for 16, 18, or 20 days and coming out in debt? They lose their finer sense of honour, and they believe that it is not wrong to clear off owing for their house rent or board. They argue that it is not their fault. They have worked three weeks or a month and have received nothing for their work and, therefore, it is not wrong to leave others in debt. We believe that this capitalistic wrong practised on the men is very largely responsible for the evil that exists, and for the men moving about from mine to mine to which you have referred.

2048. Now, what do you say about the colour bar, as it is called?—Well, seeing that the average Kaffir is bred as a slave he has no right to usurp our position as free men, or drive us from these mines—we have a right to keep the colour bar, or the ultimate consequence will be that you will have a few capitalists owning the whole of Johannesburg and having a monopoly, and the riches of this land will be sent to Europe and elsewhere for the benefit of a few shareholders, who don't care a hang whether South Africa sinks or swims. There will be a small class of capitalists and financiers and a huge multitude of Kaffirs working as semi-slaves, but there will be no room here for the white man, and, as I said before, of what good will the country then be as a part of the British Empire? I hold that the Kaffir should be allowed to get free, but in the *interim*, as he is here only as a semi-slave, I have a right to fight him and to oust him just as the Australians ousted the Chinamen and the Kanakas, and as Great Britain will ultimately oust the Chinamen and others from their ships at sea. If we are always going to lie down to the ethics of capitalism, then the white race will have no show in this country. The capitalistic class here are quite ready to go to any extreme in order to save a half-crown in working costs, quite indifferent what results may follow or what effect their policy may have on the future welfare of this country. What we argue is, that if the Jupiter, or any other mine, cannot pay reasonable profits with the machinery at their hands, and under reasonable economic conditions of industrial organisation, then they should close

down, and they should not be allowed to go on, and they will have to wait till such times as they can make it payable. Otherwise, if this doctrine of reducing working costs, quite independent of any other consideration, is accepted, who is going to define the limit? Who is going to say where it shall cease? We maintain that reasonable conditions of working shall be established, and any mine which wants to work must comply with those conditions, or else close down until it can do so, and not seek to have its conditions bolstered up by the present system of semi-slavery which exists. For my own part, I agree with Judge Higgins, that no mine or factory or other industry which cannot pay a white man a reasonable wage and work under reasonable industrial conditions should be allowed to work at all. There may, no doubt, be millions of tons of ore, of a value of two pennyweights, which could be worked if only you could get Kaffirs at a shilling a day, and there may be millions more, of a value of one pennyweight, which might be worked if only you could reduce a Kaffir's wages to sixpence, but what use is that if it is only for the benefit of the Kaffirs and a few wealthy capitalists? What use is it for the country? What good is it for the Empire? What good is it for the white race? What use will there be for shops, for theatres, for churches, or for any other civilised institutions. If you agree that the white man and the black man shall be equal underground, I say all right, get the black man and pay him an equal wage. But they do not agree to that. If the coloured man has hopes and aspirations the same as my own, I say he has a right to be free and earn a wage commensurate as a man.

2049. Now have you any view as to machines as against hammers?—Well, generally, the average hammerman can run machines, and the majority of miners now underground do not in any way stick to the one position. I have been underground since 1882, and what I think is this, that if I can earn 25*s.* a day on machines, I would rather do that than work for 1*l.* a day on hammers; provided, however, that the hammer work is the healthier occupation, then I would take hammers over, but I am not quite sure in saying that either one or other occupations is the more healthy, judging from the men whom I know who belonged to my Society and who have died within the last few years. It seems to me that as far as phthisis is concerned, both hammermen and machine men are equally liable to contract the disease, and they die very largely in the same ratio. But I would rather run a hammer stope than a machine stope, owing to less friction and to higher efficiency with the human machine. But where boys are not to be found and small or large machines come into operation, then we, as miners, are satisfied with what we have to do, to keep within the terms of the Mining Regulations.

2050. **(Sir Jan Langerman.)** At the beginning, you said that you would favour holding the black man to his sphere?—Yes.

2051. Well, what is his sphere? What part of the work would you allocate to him and what part to the white man?—I would allocate to the white man, under present economic conditions, that sphere of work which his mental capacity allows him to do more efficiently than the black man. But to give the Kaffir who has been underground only two or three months a perpendicular rise, where the poor devil doesn't know how to rig up his machine, and drops down with the machine, as I have often seen it done, I say they are simply using that Kaffir as a human machine and doing him a great deal of injury, because the fact is that the Kaffir is not aware of the dangerous position that he is in. Say, for instance, a Kaffir is in a rise, he should be there all the time, and the white man should not leave him, he should be there along with the Kaffir. If you have a rise with two machines in it, that is the place for the white man to be always, and he must not leave the Kaffir to his own devices and inclinations at all. The fact is, that the managers and others treat the Kaffir as a slave, and the poor devil often loses his life, because he does not know the dangers connected with the work he is put to do.

2052. So that you would not have natives in rises and winzes?—Not without a white man.

2053. And what about stopes?—He should not run more than two machines in the stope.

2054. With hammers?—He can run 25 or 30 boys easily. We agree to 25 boys.

2055. That is as far as you would go?—Yes, under the circumstances, until we can gradually eliminate the black man and the mines can employ white labour.

2056. Do you think the white man could take the place of the Kaffir in the stope, doing the same work, hand drilling, and so on?—Well, if economic conditions were such that, say, four white men in a stope could break as much as 25 Kaffirs with a white man as supervisor, I would allow them to have a trial. But they won't allow that here, because, to be frank with you, I believe they are afraid of a political landslide, such as we had the other day, and they at all times keep the white man back. I can give you an instance of what I mean. I have in mind a case where four white men took a stope on a mine on the East Rand without Kaffirs, and they told me at the expiration of two months that they had done fairly well—they had averaged about 25*s.* a day in this stope without any Kaffirs; but some influence was brought to bear on the mine manager, and he told them it would not do, that they were dearer than Kaffirs, and these men at the time did not believe they were dearer, but they had to go.

2057. Then you have no objection to have the black man there to-day under present economic conditions?—No.

2058. In view of the value of our mines, do you think we would ever arrive at that period where we could employ white men in preference to natives?—Well, there is the Van Ryn Deep, for instance, where within the last three months they have nearly doubled their capital, and in place of being worth 1,250,000*l.*, they are now in the market at nearly 2½ millions.

2059. What is the capital of that mine?—About 1¼ millions. In January the shares were down to about 24*s.* and now they are over 43s. Therefore, it is not really what the mine is worth which enters into it. And on that mine they are asking men to run six or seven machines. Therefore, we, as workers, have no right to enter into their capitalistic ethics at all, because if you buy Van Ryn Deep shares now you still want your ten per cent. on the enhanced value.

2060. You mean that the worker is not concerned with the financial business of the Company at all?—Quite so.

2061. But from the Company's point of view they have a right to work according to their finance?—Yes.

2062. Therefore they have a perfect right to employ cheaper labour if they can do?—Yes.

2063. So it cuts both ways?—Yes.

2064. But what I want to arrive at is this: you are not hard and fast in favour of eliminating the black men and putting white men in their place if it cannot be done economically?—It is purely a question of economics. If we can oust them as we have ousted the Kanakas from Australia, we have a right to do so.

2065. But surely that is not on all fours with the case here. Here the Kaffir belongs to the country. They were justified in turning out the Chinamen and Kanakas from Australia if they wished to do so, but here it is different: this is the Kaffir's country and you cannot turn him out?—The Kaffir has not been a hundred years here, and he turned out those ahead of him.

2066. Then would you fight and exterminate the Kaffir?—No, I would drive them down to where they came from.

2067. You cannot simply say "vanish" and he vanishes. You must provide for him?—No, you can do the same as they did in Basutoland, send them into their own territory.

2068. So you think the policy should be to import white people and in the meantime to allow the assets of our country to lie waste?—No, allow the Kaffir to go on the land.

2069. And drive the Boers away?—No. Let the Kaffir go down into Natal and elsewhere, and make the Dutchmen who hold the land cut it up and allow the emigrant from oversea to come here. If the land laws in this country are such that the landowners are able to hold up the land for a big rise awaiting the time that emigrants come here and take up land, you should alter them. In the *interim* we want to drive the Kaffirs out if we can—those who are here we will

allow to stay here—but those who do not belong here have no right to come and settle down.

2070. You say you are a Socialist: you mean only so far as white people are concerned?—No, I am a Socialist as far as all the workers in the whole globe are concerned. I believe that every inhabitant of this globe shall have the opportunity to earn his livelihood, but I do not believe that a certain section shall be used as semi-slaves for the purpose of keeping others down.

2071. The Kaffir is also a worker?—Well, as we say, he robbed the land from the Hottentot, and he should be allowed to stay on the land. What we say is that he should not be brought here to compete with the white man on the economic conditions at present existing.

2072. But you robbed him of the land?—Well, then, it is thieving all round, I suppose.

2073. You want to keep the black a slave?—No, you do.

2074. The people of this country want to raise the black so that he becomes a useful worker?—The capitalist seeks the black man to come into competition with the white man at half-a-crown a day where we ask a sovereign: is that what you call raising him?

2075. Are you in favour of nationalising the mines?—Yes, if the State did not have to take over a lot of watered capital. I say by all means nationalise the coal mines. About the gold mines, well, it is not worth while to enter into the matter, because a hundred years hence I believe we will be laughed at for going down into the bowels of the earth five or six thousand feet to dig out gold of four or five pennyweights from one ton of quartz. Of course, under capitalism, we are helpless, but as a Socialist I do not agree with it. But in regard to the coal mines, iron and copper mines, I say "yes"—nationalise them. And also the gold mines if it is absolutely essential. But I do not agree that it is. I believe that we can find some other means of exchange that would be far more preferable.

2076. **(Sir Alfred Bateman.)** You think you can do without gold?—Yes.

2077. And would you go back to barter?—No. Go back to a system of notes based on the wealth of the nation at large, and that could be agreed to by the nations of the world on the same basis as gold to-day.

2078. You would not be afraid of the value of these notes going down to nothing, practically, as they did after the French Revolution?—No, not if it was arranged on a sound financial basis. In the United States after the Civil War their green-backs went down 50 per cent., but they came back again.

2079. Therefore you think it would be possible to do without gold?—Yes, but not just at present, because the capitalists all over the world evidently find it to their interests to keep things as they are.

2080. As regards drink, I gather you are not in favour of local option, are you; you would not keep the white man from having a drink?—Well, I was never raised in a dry State in America and cannot say from experience how it works. But speaking for myself, I would say that the drink question has very little to do with the larger economic questions at stake.

2081. Not here—not among the whites?—Yes.

2082. Don't they waste a great deal in drink?—No, not if the average spent by the white man on drink is taken into consideration. And I think if they drank less and saved the money, in two or three years' time their wages would go down half-a-crown a day.

2083. It would lower the general standard, both as regards food and drink?—Yes.

2084. But surely you do not approve of the drinking that goes on between Saturday and Monday, when the men lay in cases of whisky in their rooms and drink till it is finished and they are incapable of following their duties?—Well, I am a temperance man myself, and I often argue that our men would be far healthier if they spent less in drink. But owing to the fact that they have no homes here, and are afraid to have their wives here, and the arduous nature of their work, they like to meet their fellow men in hotels and clubs, and if the capitalists cannot offer anything else they will find their conviviality in such places.

2085. Why should they not bring their wives here?—Because they are afraid they would be unable to keep them and to enjoy that standard of life which they have a right to expect.

2086. Even on 25*s.* a day?—Well, if they had that, and if they were sure of a daily wage of that amount, they could live, and provided health conditions were better. But take the five or six years they can expect to live now. I can see hardly anybody living that worked with me fifteen years ago—not one that I know of. What is the use of that? What is the use of having a home and then in three or four years you are dead and the wife and family left to the mercy of the country.

2087. Is it not now very much improved in regard to phthisis?—No, I do not think it will be for a few years yet.

2088. It will in time?—I do not know.

2089. Do you approve of the Labour Exchanges?—It would be a good thing to have a genuine Labour Exchange, but the trouble with them is that they generally resolve into scab shops, and when one portion of the workers go on strike they turn to the Labour Exchanges, just like the Premier Mine did the other day—"Send us 400 men."

2090. In England, if there is a strike or lock-out the men are advised by the Labour Exchanges not to go to the particular place?—Well, I read the "Labour Leader" and I have read information which differs from that very largely. But they are not so open there. One of the features of South Africa is that they get these things done openly and without shame. Capitalistic ethics are so pronounced that they will tell you frankly what they mean.

2091. You think capitalistic England is more cunning?—Yes.

2092. **(Mr. Lorimer.)** I gather your position is this, that the supervisorships and best-paid jobs should be reserved for white men, and coloured men should only do the harder and more toilsome work?—Yes.

2093. And do you say that apart altogether from whatever intelligence or knowledge the coloured man possesses or acquires?—Not that he should be handicapped. We do not, as workers, at any time state that the coloured man should not be able to earn all that his intellect allows him to, but what we argue is this, that the Kaffir, as distinguished from the coloured man, has no right to be brought here as a semi-slave at half-a-crown a day and then allowed to compete with us when he is under the law. At no time do we say the coloured man should not be allowed to earn all he can, but we say that if the Kaffir competes with us for a lower standard, we are going to fight and drive him out if we can.

2094. What I want to be at is this: if you are shown that the coloured man is able to do a white man's work, would you allow him to do it?—Will you tell me if you mean a native or coloured man?

2095. Any man?—There is a vast deal of difference.

2096. Do you say you would allow some possibility of advance to a coloured man which you would not allow to a black man?—I do not think you can discuss individual cases. One swallow does not make a summer and one intellectual black man does not justify the principle of competition between black and white which the capitalist is seeking to introduce.

2097. If the coloured man is able to do a white man's work equally well would you let him do it?—Yes, if he works at the same prices as myself.

2098. Then you would put him in a position of responsibility just as you would a white man?—Yes, for equal wages.

2099. According to the Report of the Economic Commission the wages paid on the Rand are the highest in the world?—Yes.

2100. It is only natural and proper that you should all want to get the highest wages you can?—Yes.

2101. But will you tell me what you regard as the justification for the wages here being the highest in the world?—In the first place it is because everything here is twice as dear as it is anywhere else. The next highest place in the world I was raised in—that is the town of Butte, Montana, where the largest

copper mines in the world are, there we got 3½ dollars a day. House rent was only about half what it is here. A man could have board and lodging for a dollar a day. Now here, where the average wage is only a third over that of Butte, the cost of living is twice as much. The fact is that the railways, landowners, and oversea speculators have made everything so high that the white man cannot live for less than a pound a day, but if things were as cheap as in Butte, Montana, we could probably live on 16*s.* 8*d.* a day.

2102. You justify the high wages because of the high costs?—Yes.

2103. Is that not cause and effect?—No, it is because the land laws here are made in the interests of speculators.

2104. But if you get very high wages, it necessarily makes everything that is produced in that area very high also?—Well the fact that the average wage here is not 1*l.* a day shows that the whole of the workers do not receive that amount. If you take into account the coloured man and the Kaffir here it is not fair to say that we have the highest wages in the world. The farmers have their knives into us, the railways have their knives into us, the Cape, and elsewhere, and we are made to pay very dearly for all the necessaries of life and all our requirements in the way of house rent, food, and clothing.

2105. Do you regard the high profits made on the Rand as a justification for the high wages you claim?—Yes, and the shortness of men's lives.

2106. Then, obviously, if there were a falling off in the profits of the Rand you would regard that as a justification for a reduction of wages?—That would depend largely on whether the watered stock would bear the falling off. We have no right to pay for watered stock to the tune of 20,000,000*l.* for the benefit of people oversea and accept that as a falling off in profits.

2107. One remark you made impressed me very much. The Economic Commission's Report states that the wages are the highest in the world, and that the cost of living is relatively not so great, and yet you say that these men who obtain these very high wages and have the benefit of a relatively moderate cost of living do not save anything?—Very little. I cannot select ten out of 500 who died out of my Society worth 500*l.*

2108. You say that is very common?—Yes.

2109. It is an awkward state of things; what is the consumption of drink per head of the population here?—I presume it would be fairly high on the white man, but I do not believe it is as high as in the case of the people who go in and out of the Carlton Hotel. It may be high according to the average knowledge of the capitalist, but I can assure you they drink ten times as much as we do.

2110. I think you also said your ideal here would be something like that of Australia?—Yes.

2111. Of course, you must recognise the absolute difference between the two sets of conditions. Australia has tried to keep out the coloured man?—Yes.

2112. But you have them here already in the proportion of ten to one. How can you think of trying to create any analogy between the two?—By keeping the black man to Zululand, and Basutoland, and up country where he comes from.

2113. You would turn them out of the Union altogether?—Very largely.

Mr. Wilfrid Wybergh, called and examined.

2114. **(Chairman.)** I gather you will speak on the following subjects: first, black and white labour on mines; secondly, the effect of phthisis on the mining industry; and thirdly, the relation of the mining industry to the country as a whole?—Yes.

2115. Will you kindly speak on those points?—I would prefer to begin with the last item first. The point which impresses me particularly is this, that in reality there are two fundamentally different points of view in regard to the relation of the Colonies to one another or of the Empire to any Colony, and I think those two points of view are incompatible with one another. The one regards this country as a field for investment of capital, and the other is as a field for human beings. Of course, I propose to speak more from the latter point of view, but I want to emphasise this point before the Commission, that it is the former point of view that most of our industrialists have always taken. The point of view is exemplified in those people who talk about this country and others and make use of such phrases as "The trade follows the flag," "Opening of new markets," "The native is a great asset to South Africa," and so on. Well, that is quite a common point of view, and I want to make it quite clear at the beginning that I am not taking that point of view, but the opposite one. The actual effect of the first point of view was made very clear a few years ago in a conversation which I had with Lord Harris, when we were discussing the question of land settlement, and everybody was in favour of it in those days. I pointed out to him the availability of a large portion of this country for settlement, and to my surprise he answered me, rather contemptuously in a way: "Oh, you mean closer settlement and that sort of thing. Of course, I was referring to South Africa as a field for the investment of capital in agriculture." Now that sufficiently indicates the difference between the two points of view. From my point of view the only thing that is really important to a Colony, and the only direction in which any industry is important to a Colony, is simply this, how far it provides employment and homes for the people. The question of how far the Colonies are a field for the investment of capital is, I think, a matter of quite minor consideration. I speak specially, of course, in regard to the mining industry. I look upon the mining industry's principal utility as depending upon how far it is going to be the means of attracting population and providing homes for the people and work for the people. Of course, the attraction of population to the country is, to my mind, the main function of the mining industry: it is a blessing to the country in so far as it attracts a white population, and that being so, I think that one of the most important questions that I can touch upon is the question of the relation of the Kaffir and the white man to the mining population. Now that attraction of population is in many ways incompatible with the ideal of the mining industry as a field for investment. The two interests are often quite divergent. The object of those who look upon the mining industry as a field for investment of capital must be, of course, to get the gold out of it at a minimum of cost and with a minimum number of employees and in the shortest possible period. It would be actually to their interest, if it could be done, to scoop out all the gold and to empty the mines in a week. That is obvious from the financial point of view—the saving of interest and the various charges. But it is equally obvious from the point of view of South Africa that such a course would be disastrous. That, again, is an illustration of those totally divergent points of view. We South Africans, such as I, of 23 years' standing, certainly deprecate the view that we are merely a convenience to the investor or even that our mines are anything but our own asset, whoever the private owners of the shares may be. Now the position is, of course, unfortunately, at the present time that the mining industry is not owned by the people of South Africa. The mining industry is owned almost exclusively by foreign investors, and the last shred of even nominal ownership was taken away from the people of South Africa a few years ago when the Legislature, as the culmination of a long agitation on the part of the shareholders, finally decided that the State did not even remain the nominal owner of the minerals, but that the actual ownership was transferred. Now that was the culmination of a long period of agitation and wire-pulling and so on, and it only illustrates how entirely the ownership of the mining industry has passed out of the hands of South Africa. On the contrary, the actual mining industry itself—in so far as by the mining industry is meant the people who

work the mines—has, in the course of the twenty years I have known South Africa, changed from being a mere floating population to practically a settled population. Practically half the men working the mines to-day are South African-born, and of the remainder by far the larger proportion are permanently settled in this country. Now if the mines are to be used and worked for the purpose of attracting a white population to this country, as I think they should be, it is necessary to revise entirely the present methods and the present points of view. From my point of view it is not a question of which pays the best dividends, but which is the best for the country, and the question in regard to the use of the white man as a miner is not whether it is desirable, but how far it is possible. By "possible" I mean without making an actual loss—by winning the gold at a less cost than the value of the gold when won. I do not feel that we are under any great obligations to consider the interests of capital, except in so far as it is actual cash brought from abroad and put into these mines.

2116. How do you propose to get further capital under this régime?—In the past the great bulk of the capital invested in these mines has come out of the mines themselves, and I think it will continue to do so. It has been re-invested. There is comparatively a small amount of actual cash capital from outside which was brought in in the first place. That is the view which I wish to put before the Commission. Therefore, I say we are not very much concerned with the price of shares, and we are not bound to consider whether a man makes a good speculation or not. It is not nearly so impossible to provide our own mining capital out of the mines as some people seem to imagine, and as a matter of fact, although twenty years ago the whole place seemed to hinge upon the share market, to-day no one ever cares about the share market, and thousands of people in Johannesburg live and pass their whole existence and die without knowing that there is such a thing as a Stock Exchange. When I remember the early days, nothing else was talked about. Furthermore, whereas twenty years ago the town of Johannesburg, and the whole country, to a large extent, was directly dependent upon the mining industry, I do not think it is so any longer. We have become, in regard to South Africa, very much as Sydney and Melbourne are to Australia. We were started by the mining industry, but we are no longer merely a mining place: we are a metropolis. Now the way to attract population is certainly to increase the ratio of white men to coloured men—not merely to increase the number of white men: that is of very little use to the future of the country. It is no good bringing in 1,000 white men if, at the same time, we have to import 10 thousand or 20 thousand Kaffirs from outside. We are not getting any nearer to making it a white man's country. Therefore, what is of great importance is not the number of people engaged in the industry, but the ratio of white to black. That is how I judge the national progress of the industry. Furthermore, unless we can use our industry for attracting a larger white population, then the quicker the mines are worked out the quicker our assets will be dissipated, and we are getting nothing for it. The only thing which is worth while getting for our gold is: men. That is fundamental. Now the white man is not as welcome here as the Kaffir, for many reasons—for one thing because he is dearer, and another thing because he is more independent—and in the past we have been hitherto actually basing our entire industry upon Kaffir labour. That was all very well so long as there were very few white people settled in the country, and practically no children growing up to require work. But the position is now in Johannesburg itself, for instance, that we are discharging every year 1,000 children from school, and because the Kaffirs do all the work those thousands of children—and many other thousands all over the country—have no future before them. So it is of paramount importance for the future development of the race that we should alter the whole system. Instead of attracting population we are losing population. We are attracting the black population here. They are coming up from Natal and from Cape Colony and from Portuguese East Africa, and all over the Union, and we are attracting also, of course, a certain number of white people, but they do not actually go into the mines. As a whole, South Africa is losing white population, and that process will go on until such time as we base our industry on white unskilled labour. It is not enough to have white skilled labour, for the skilled labour cannot at any time form more than a small proportion of the whole. I do not know whether the Commission is at all interested in the details of how this pressure of black against white actually comes about, but I could deal with that.

2117. No, I do not think so.—Well, as to the possibility of using more white labour, there is a greater possibility now than there has ever been in the past, largely owing to this great tendency towards amalgamation. Now amalgamation of the different mines has been looked upon by many people in the past with some fear, but to me it seems to be perfectly natural and inevitable, and I welcome it, because I see the chance of its leading somewhere in the direction we ought to go. I welcome amalgamation for this reason, because it tends to make the rich mines pay for the poor mines. The great argument against white labour in the past has been,—What is to happen to the poorer mines? Well, I say again—perhaps somewhat brutally—oh, never mind them; they will be amalgamated. The history of the industry has always shown that when a mine did not pay by itself it amalgamated with a richer mine, and this tendency would continue. So I look forward to amalgamation with some satisfaction, and for another reason—because I am perfectly certain that we cannot allow an *imperium in imperio* to grow up, and when the time comes that all the mines are amalgamated it will bring State ownership into the region of practical politics. If you take the industry as a whole and recognise the fact that they are paying eight millions in dividends every year, that leaves a very large margin for a possible increase of expenses owing to the employment of white men, without any necessity to shut down a single stamp, if the process of amalgamation becomes complete. I do not know whether it is desirable to say anything about the position of the native in the matter?

2118. Yes.—Well, this white policy is not a selfish policy simply for the benefit of the white man, without care at all for the Kaffir. As a matter of fact, the Kaffir in this part of South Africa is as much a foreigner almost as we are. He does not belong here; he belongs to the North and East, historically. The Transvaal was almost empty of Kaffirs when the white men came in: so was the Free State and Natal. The Kaffir problem is one we have deliberately brought upon ourselves by our efforts to import cheap labour, and if we cease those efforts the problem will diminish to a very great extent. And I feel that it is not in the interests of the Kaffir, any more than it is in the interests of the white men, that the two races should be mixed. I believe in Shepstone's policy of segregation. I was an advocate of it long before I knew that Shepstone was in favour of it, and now I believe that Lord Milner has come over to the same idea. It is in the interests of the Kaffir to keep him away from the Rand, and it is in the interests of the white race to make Kaffir labourers as difficult to get and as scarce, and consequently as expensive, as possible. Only in that way can we prevent the standard of the white labourer being reduced towards the Kaffir's standard, and only in that way can we prevent the Kaffir from being corrupted. I do not claim to be a native expert, but I may say that I habitually spend my holidays in travelling about the country, and I see a good deal of the natives and talk to them in their kraals, and I find everywhere in my experience that the one thing the natives are anxious for is to be left alone and to avoid the necessity of coming to work on the Rand. The chiefs say, "Let us keep our young men; we do not want them going up there to be corrupted. We have no enmity against the white man, but we want to be separate." Of course, they say that the main thing towards that object is, first of all, a proper system of land division and, secondly and all important, that they should be allowed, instead of paying their taxes in cash—which has to be earned here on the mines—to pay their taxes in kind, in agricultural produce, which they could produce on their own ground, and thereby avoid the necessity of coming here at all. That is the point of view that has been put to me by Kaffir chiefs and by the friends

of Kaffirs who have travelled amongst them and who know more about them than I do, and I think it is a very sound point of view.

2119. **(Sir Alfred Bateman.)** I think you said that the State had nothing to do with the mines now as owner?—No.

2120. But surely there is a first charge—a tax—on the mines?—There is the profits tax imposed by the State, but that is only a tax in the ordinary way, and claim licences, which are also the ordinary form of tax. But the State ownership—the ultimate ownership of the minerals that formerly vested in the State—was a few years ago taken away from the State and granted to the owners of the soil.

2121. But surely the revenue of the Union gets an immense lot of money directly and indirectly out of the mines?—Undoubtedly; they are subject to taxation.

2122. It is nearly half the revenue, is it not?—It is impossible to say what the amount is directly and indirectly. One can estimate the direct amount, but the indirect amount is a matter of opinion—how far it is due to the mines and otherwise.

2123. I think I understood you to say that a great deal of the capital in the mines invested in recent years has been in the form of profits turned into capital?—Yes.

2124. And that concerns South Africa alone and does not concern the capitalist in England?—I do not wish to be thought to say that the value of shares is no concern of ours, but I say we are primarily not so much concerned with the Stock Exchange operations as we are with the question of the cash brought into the country.

2125. But for the good of the Union generally you will, for a long time, will you not, require capital from outside?—It all depends on the price we have to pay for it. If we can get capital cheap, well and good, but if they ask too big a price we say no.

2126. Then you do not contemplate any progress?—Yes; but after all, the principal capital of the country is the wealth in the country and the people in the country before everything.

2127. But does not that wealth want developing?—Yes.

2128. You want roads and railways and other public works?—Yes.

2129. Where is the money to come from for those objects?—I quite agree that the State will require capital.* In my previous remarks I was referring to capital for the mining industry.

2130. **(Sir Jan Langerman.)** You said that a few years ago the ownership of the minerals was transferred from the State to the owner of the land by law. But surely that is not correct?—I think so.

2131. In what way?—If you remember the old law, as it was when I was Commissioner of Mines, the old law was that the ownership and control . . . .

2132. Before that law which you refer to, which was passed when we were both in the same Parliament, the owner had the right to 10 per cent. of his farm—to mark that off in minerals on proclamation. Is not that so?—I think the mynpacht was 10 per cent.

2133. And besides that he had his werf?—Yes, that was a thing reserved.

2134. And he had his owner's claims?—Yes.

2135. The law you spoke of consolidated those three rights into one right. That is all the change that took place in the ownership of the minerals?—I think you are wrong. It did that, but, in addition, the actual wording in one of the principal clauses was altered in such a manner that the words "ownership of the minerals" disappeared.

2136–46. I think you are wrong?—I do not think so.

* *Witness's Note.*—To this I would like to add that the credit of the State depends far more upon the number of the white population than upon the price of mining shares. Further, that the credit of the State must obviously stand higher if the minerals are retained as an asset of the State, and exploited for the common benefit, instead of being handed over to private capitalists.

Johannesburg, Friday, 4th April, 1914.

Mr. Howard Pim, B.A., Chartered Accountant, called and examined.

The following statement by the witness was read:—

1. The population of South Africa is about 7½ millions; the natives and other non-whites outnumbering the whites by five to one. Their share of the work of the country is also increasing daily. They are drawing a rate of wages which is approximately equal to one-tenth that of the white workmen.

Included in the above total is a population of 620,000 coloured people—half-castes—who in certain parts of the Cape Colony—Capetown especially—fill to a certain extent the gap between the two, and in this gap the Natal population of 140,000 Indians may also be placed, not on the ground that they earn a much higher rate of wages than the native, but because they work continuously, which the native does not. Owing to the native working only for short periods at a time, the wages he actually receives are far below the figure I have mentioned. The gap between these two sections of the community is therefore very great indeed.

A white community is closely knit together, and every section of it interdependent. The wants of the South African native are so few and small, and there is so little to be done for him, that the position in South Africa is very different, and while the white community finds itself in the position of requiring much native assistance to carry on its work the native community is independent.

One result of this is that even the low rates of wages above-mentioned paid to the native are out of all proportion to their wants, and if he is content to live at the old tribal level he practically need never work at all except to obtain the money to establish himself. More and more, however, natives are beginning to work continuously, or, at any rate, for some months during every year, and their wants for clothing, &c., are certainly increasing.

A result of this irregular work has always been that few of them become skilled. There is, however, to-day an increasing number who are acquiring a certain amount of skill, equal at any rate to that possessed by the less efficient whites. This is specially the case on mines and works.

The poor white appears to me another result of the gap between these two social strata. If at any time there is no employment for a white man in the ranks of the white community, he has nothing to fall back upon, and falls right down to the Kaffir level, or even below it, because he is probably destitute, while the Kaffir has his share of the tribal lands and other assets to fall back upon.

In Mr. Bryce's book on the American Commonwealth, the poor white in the Southern States is spoken of as a result of slavery. In view of the South African experience, it appears to me that no other cause for the existence of the poor white than this great gap in the standard of living of the two sections of the community need be adduced. This makes the problem an extremely serious one, for it means that they will continue to be produced whatever efforts are made to prevent it, as long as this great gap exists in our social system. This gap cannot be closed from above, and to close it from below means a transformation of the habits of the native races which can only come about after some very lengthy period, and then only if the native races are capable of such development.

Returning to the general question, I would submit the importance of bearing in mind, in considering all South African questions, this unique fact of our social life.

2. The native is genuinely anxious to obtain education, but it cannot be said that any systematic attempt has been made to give it to him. A large amount of excellent educational work has been done by missionary bodies, but to educate our 5½ millions of natives requires an adequate supply of native teachers. This is the only way in which any far-reaching results can be obtained, for in this country we cannot obtain sufficient white teachers to staff our white schools. It is clear that to provide these native teachers provision for secondary education and normal colleges are essential. At the present time there is a scheme for a native college in the Alice district of the Cape Colony, but, so far, the only funds provided have been supplied by the natives themselves and by individual well-wishers among the whites. To start industrial schools without Government support is practically impossible, owing to the cost of the land and equipment required.

3. A certain number of skilled native workmen are produced by the existing missionary schools, and a section of the white population consider them a serious menace. The Economic Commission, as will be seen from section 57 of their Report, do not agree with this view.

The one form of native education extensive enough to affect the country generally is the education which the native worker is obtaining on the mines. Here, in a number of cases, he appears to have reached a level equal to, if not above, that of the less competent whites. The benefits of this skill and knowledge he is prevented from gaining by the Mining Regulations, which stipulate that mine work in many respects has to be carried out by whites. This colour bar he resents to-day, and is certain to resent it more and more as time goes on.

It, therefore, appears to me that if our South African native population of industrial workers is to remain contented, concessions in this respect will have to be made, and it would be wise to make them before discontent arise, not merely for economic reasons, but also for the wider reasons which a liberal native policy must take into consideration.

That there are certain forms of skilled work which the native is perfectly capable of performing is clear from the evidence put before the Economic Commission.

4. The question of apprentices is dealt with in paragraphs 44 to 46 of the Economic Commission's Report, the most important fact to be borne in mind being that in a white community the only way of filling up gaps in the ranks of the skilled trades is by taking in white boys as apprentices. From the employer's standpoint, therefore, there is nothing like the same inducement for him to obtain apprentices and treat them properly as there is in a white community, the Kaffir being available to fill any gaps which arise. From the apprentice's point of view, also, the inducement to complete his apprenticeship and become a really skilled tradesman is also reduced, for a comparatively little skill will enable him to earn higher wages as a supervisor of Kaffir labour than his employer can possibly afford to pay him as an apprentice

It appears doubtful, therefore, if South Africa can ever become a nursery for really skilled artisans, and probable that where such skill is required it will be imported from oversea. This has been the case hitherto, and, incidentally, it will mean that the wages for skilled tradesmen in South Africa will approximate to the figure required to attract the skilled tradesman from oversea.

The great majority of appointments for whites open in South Africa are connected with the supervision of native labour, and this particular form of ability is the one which most easily finds employment and at the highest wage. Naturally, it is more often found among whites born in South Africa, who are accustomed to deal with natives, than among immigrants.

However useful trade schools may be, the Economic Commission also came to the conclusion that they cannot fill the void resulting from the conditions which militate against apprenticeship.

2147. **(Chairman.)** Have you anything to add to your statement, Mr. Pim?—Yes, I would like to add a few remarks, pointing out in the first place the irregularity of white employment and some of the causes of it. (*Statement, paragraph* 1.) Of course, owing to the native community being self-contained, and the white not self-contained, the native is quite independent of whatever is done by the white, but the white is not independent of the native. Then I desire to refer to the least efficient white, who is very rapidly reached as we descend in the social scale. There is nothing in this country to correspond to the range of efficient whites which you find in a white community. With reference to the poor whites, the Economic Commission made a suggestion in regard to labour colonies. We placed a great deal of importance in our report on these colonies, in fact, I do not see how the poor-white question can be adequately and systematically tackled in any other way. The difficulty is increased when we remember that in all districts of this country there are a number of people on the land who are barely able to make a living, barely able to subsist; and to-day they are a great drawback and hinder very much the application of laws for the betterment of agriculture—for instance, for the eradication of scab, or dipping for tick diseases, and anything of that sort. The result of any increased burden on these people will at once be to throw them into the ranks of the poor white. That class is quite considerable, and before anything is done you will have to make provision for that class, it seems to me, in some form of industrial colony.

2148. What do you mean by industrial colony?—A labour colony. With regard to the children, we had one very interesting experience. We visited an industrial school at Uitenhage, where there were a number of the children of these poor whites being taught trades, and the stamp of child was excellent. There is nothing the matter with the poor whites. They have simply been thrown down to the Kaffir level, and some below—had nothing to do and nowhere to go—they were absolutely destitute. But, of course, in any such movement where you are dealing with this very serious matter, you have to find the men who are suitable to supervise such schools, and that is not an easy matter. It is such a very special job, that people for this class of work require to be very carefully chosen. I do not see why children trained in these schools should not be just as effective on the average as any other section of the population. It is not as though those people had been poor whites for any length of time, and the stock had very have alluded.

(*Statement, paragraph* 2.) I should like to lay stress on what missionaries have done in native education with considerable success when their resources are taken into account. I think they have done a wonderful work, but, of course, they have been hampered by the want of funds to which I have alluded.

(*Statement, paragraph* 3.) Now, with regard to the importance of our native population remaining contented, I should like to point out the extraordinary docility of this population, and the ease with which they have hitherto been controlled. The best proof of that, I think, that can be given, is the fact that the total white staff in Basutoland, with its population of over 400,000 souls, is barely 30. That includes the Resident Commissioner, his Assistants, and police officers, the Veterinary Surgeon, and the Engineer and his staff. Those are the only whites engaged in the control of Basutoland. And to pass to districts of the Cape Colony, the ordinary provision, as far as whites are concerned, for the supervision of districts containing 40,000 and 50,000 Kaffirs is two or three white policemen. One can imagine what that might easily become if the tribal system was broken down, or if serious discontent broke out in those districts.

Then there is another aspect of the colour bar which I might mention, viz., that it results in lack of competition, which has distinctly had a bad effect on the white standard of work. The fact that the native is prevented from doing many kinds of work removes competition to a large extent from those areas where the colour bar applies, and I should certainly say from what one has come across that the

result has been not in favour of the competence of the white.

With reference to the capacity of the native for skilled labour, I should like to quote some short extracts from evidence given here with reference to the mines, which incidentally raise quite a number of points. "We all feel that Kaffirs here are capable of much better things, but to-day they are not allowed to do those things. The position is that the amount of incentive that you can give to the native doing the work that he is doing is limited, and to get the full efficiency out of the native you will have to open positions to him that are closed to-day. If you were to select natives whom we have on the mines to-day and whom we have in the Cape Colony to-day and give them responsibility, I think it would reduce the accident rate." (These are very responsible witnesses.) "If you continue to keep the natives in a position of perfect irresponsibility as they are to-day and increase the size of the gangs with the whole of the responsibility on the white miner I think safety will be decreased. We have to-day on the reef, I am convinced, a number of natives that are just as good as whites now in all branches of mining. The limit of economy in the supervision of natives has not been reached if you give them responsibility as well, but with the natives restricted as they are now, we have reached the limit. As the native becomes a competent miner he should be treated as such." Another witness: "Some natives have a great deal of experience and are really capable men—infinitely more capable of judging underground conditions than the great majority of white men. The native has a natural sense of danger." I would quote those witnesses on that point.

Then, with reference to this general position of the removal of the colour bar. The Chamber of Mines considers that economy would result from the employment of natives in mining positions they are competent to take, practically on the lines adopted in regard to negro labour on the Panama Canal. The Transvaal Miners' Association, however, strongly opposes any modification of the existing regulations, holding that a step of that kind will enable the mine owners to become increasingly independent of the white miner. There would appear to be force in both these views, but one important factor, the native himself, has not been taken into account sufficiently. Certainly he will claim these positions soonor or later, and one would recommend that all parties should consider the question on its merits and decide on some concessions before agitation commences among the native masses.

There is just one other point I should like to make. A very large part of the labour used here comes from the east coast, and does not come back quite so often as the labour from shorter distances. The effect of that larger proportion is, of course, that a less insistent call has been made on the labour of British South Africa.

2149. You mean Portuguese boys?—Yes, and consequently that labour, owing to the importation of these East Coast boys, has not developed, perhaps, so quickly as it otherwise would have done. So that the position really has been delayed—I mean, the coming of this difficulty of the native insisting on being recognised as a skilled workman has been delayed—by these importations from outside British South Africa. Just three figures in regard to the labour supply on the mines here, which might be of interest: In 1894, the number of natives at work was 41,000, in 1899, 98,000, and the average for 1913 was 214,000.

2150. That is mines, including diamond mines?—Mines and works in the Transvaal—that is the official figure.

2151. Excluding De Beers?—Yes.

2152. **(Mr. Sinclair.)** I only want to ask one question on one subject, because I think the other phases are so fully put by you that further interrogation is unnecessary. But about your suggestion that industrial farms should be set up to deal with the poor white. Do not you think that the best system of attempting to deal with that would be to set up farms on the lines that the Salvation Army has used in different parts of the world?—The most successful experiment of the kind I know of is that of the Dutch Church at Kakamas, on the Orange River.

2153. You can perhaps tell us about it?—I am afraid I cannot give you many particulars, but the essential features of the scheme, I think, are that it is under very strict Church control, and that it is so far away from any other, you might say, habitable part of the country, that it is practically isolated. It is not a very old foundation, and whether there has been any output of workers to other parts of the country or not, I am not aware.

2154. But you knew that the efforts of the Salvation Army have been systematic where farms have been established, and that the schemes have been based upon work and self-help by the unfortunate worker, and the helping hand; and the result, I suggest, has been the most successful social movement in that direction in present times. Now, do not you think that a settlement on those broad lines would do a great deal to give a start to, and set up and help and discipline, the poor white to whom you have referred?—Yes.

2155. You are deeply interested in this question, and I was going to ask whether you had had an opportunity of considering the methods and the system that have been so successfully adopted by the Salvation Army in different parts of the world and with a minimum of expenditure?—No, I have not.

2156. I suggest that the treatment there would seem to be so applicable to the very grave difficulties that face this Union, with the multitudes of poor whites, that it would be profitable to consider it in all its bearings?—I think so, especially, as I think I pointed out in my memorandum, that there is a cause perpetually working which will produce more and more of these poor whites.

2157. In order to set up the poor white, he must have the discipline of work?—Yes.

2158. Work carried on with the supervision that provides the necessary kindness and the necessary directive ability?—Yes.

2159. **(Mr. Tatlow.)** I think you said, did you not, Mr. Pim, that there were not sufficient sons of white workmen willing to become apprentices, and that there was a shortness?—There may be sufficient if they would all agree to learn the trades, but the difficulty is to get them apprenticed, and when you get them to keep them.

2160. Are there sufficient openings for much larger numbers than present themselves?—For highly skilled work, I doubt it. But for the ordinary workman, useful throughout the country, of course, there are many openings.

2161. And it is the reluctance on the part of the boys to any real manual work, is it?—There are so many inducements to take them away; I mean, the fact that they can earn higher wages at other work of a less onerous kind.

2162. You said something about the native working more continuously than he used to do. Do you refer to the native on the mines?—Yes. His period tends to become longer, and more and more he is coming back.

2163. That will make him more efficient?—Undoubtedly. It is as a result of that development that the skilled native is being produced.

2164. I take it you are personally in favour of the removal of restrictions on the native workman, in order to give him a chance with the rest of his fellows?—Looking to the future of the country and the necessity of keeping the native races contented, I think they would have to be removed, because, as you see from the Economic Commission's Report, feeling is getting quite strong. Might I read you an extract from a speech by a native at the recent Transkei General Council? It reads as follows:—

"Councillor Memba moved for the appointment of a Select Committee to consider and report upon native labour questions. He said the present system was attended by grave abuses. Natives objected to being practically sold to the mines at so much a head, like pigs and goats, and disliked the whole system of middlemen and agents. He severely criticised the system of advances, and declared that the Chamber of Commerce and other bodies had acted in the matter without consulting the persons most interested—the natives themselves. By their loyalty during the recent industrial crisis, the natives had earned the right to be consulted in matters which concerned them. Turning to labour conditions on the mines,

he said that natives were prevented from making any advance, and, however skilled they might become, they were kept down as common drill hands. Skilled and educated men were not wanted, and the Council should not hesitate to let the Chamber of Mines know its opinion on the subject. Shareholders of mining companies were losing money by the rejection of skilled native labour, which could be obtained at a third of the cost of European labour."

He then goes on to deal with illicit liquor and miner's phthisis, and another Councillor dwelt on the abuses of the advance system.

2165. **(Mr. Garnett.)** Can you tell us whether the settlement made at Kakamas by the Dutch Church takes whole families on the land and settles them?—Yes.

2166. It puts adult men on the land?—Yes, the whole family.

2167. And tries to lift them out of the position of the poor white?—Yes. I fancy the results, as far as the adults are concerned, however, are not very hopeful.

2168. They are taken in hand too late?—Yes.

2169. But your opinion is that an extension of this system on the lines of the Dutch Church settlement at Kakamas would be of very great social and political importance to the State?—I think it is bound to come.

2170. Then, in your opinion, there is no other means of rescuing these people from a further fall than by taking them in hand and settling them on the land and having the children to take the places of the higher artisans and the positions that the white man holds to-day?—Yes. The railway has helped to a certain extent in this direction, but there is one difficulty about that, and one feature which bears rather particularly on what Mr. Sinclair has said. I will give you an instance. At East London one labourer told me that he could not possibly live as he was only getting 4*s.* a day, and he complained bitterly of the way he was being treated. I asked him a few questions, and gradually I got out of him that he and his family were earning over 1*l.* a day, and yet he came to complain of what he himself had been earning!

2171. **(Chairman.)** Who was this?—One of these workers on the railway. That element of training, of control, is wanting where men are taken from the country and simply thrown into the town. But in the country there are places where there would be no opportunity for the children to earn anything. This instance emphasises the importance of following the line which Mr. Sinclair has indicated.

2172. **(Mr. Garnett.)** I see in your statement you say that even now you cannot obtain a sufficient number of white teachers to start your schools?—That is a very unfortunate thing. I may say that I am Chairman of the Local School Board, and this is the most populous district of the whole Colony. We have 16,000 children in the schools, and the schools are large, some of them containing 600 children. They are within a comparatively small district, so from every point of view it is desirable from the teachers' standpoint. But we are at a loss for teachers, especially for some of the higher grades. And the country districts are, some of them, very badly off indeed.

2173. Is one reason of this shortage the greater attractions of going into other occupations—for instance the attraction of responsible positions in the mines? Does that detract from the number of people who might take it up?—I should rather doubt that. Of course, our Normal Colleges are working very hard, but you must remember that our system has only been working for about ten years, so that later on perhaps our supply will reach more satisfactory figures. Very possibly it has not yet had time to balance, but we can only just fill our requirements, and other Boards cannot fill theirs at all.

2174. **(Sir Alfred Bateman.)** First in regard to the natives. We had evidence yesterday on behalf of the Miners' Association protesting against altering the system of allowing the natives to do their present work, one of the chief grounds being that the Kaffirs were still semi-slaves, and, as such, they had no business to compete with white men. Do you agree with that argument? Are they semi-slaves?—Well, of course, that extract which I read just now is on something the same lines, but the allegation of semi-slavery as made by the Miners' Association is only true in a very forced sense. At the same time the native certainly objects to being practically sold to the mines. The way that arises is this. The native runs up an account with the local storekeeper, who is very often also a native labour agent, and as soon as that account reaches a figure which the storekeeper considers is excessive the native is told he has got to go out to work. That is what they mean by being sold to the mines. Meanwhile, the storekeeper pockets the advance and gets the native's account into a healthy condition, and I suppose the rest of it is paid off when he comes back from the mines. But that system of credit which is given to the natives is another thing which it is extremely difficult to tackle and which has reached enormous dimensions. I should think it was increasing. I cannot say; but it must be, I should say. Some years ago I got some figures on the subject, and in one district of the Cape Colony alone—the Glen Grey District—the advances to natives exceeded 100,000*l.*, and that is in a district of about 50,000 population. Those were Government figures.

2175. Would these natives be under the tribal system?—In Glen Grey District, no. There they have individual tenancy. That was the district to which Mr. Rhodes's Act applied.* The condition of things I allude to also applied all over the country in tribal areas. One exception is Basutoland, where the law gives the trader no right of recovery at all if he gives credit to a native.

2176. Would it be a good thing to extend that law?—I should think it would. It appeals to one as being a commonsense point of view, and no native tribe goes out to work more than the Basuto.

2177. Although he is not compelled by his creditor to go?—No. But there there is more pressure on the land.

2178. Is it a desire for more land that induces him to go out? Is it the want of money?—He wants money to meet his requirements for clothing and so on, and sometimes for food. He cannot buy land in a white area except to a very limited extent, and only in certain districts. Of course, there is another curious feature about that. There are quite a number of farms in the Transvaal which are owned by natives. If a native wants land he makes very little question of the amount of money he pays for it. There is no question of going into the return which he will get. He wants the land and he pays for it.

2179. Does he not bargain?—He does, but he will pay prices which are often not economical prices at all.

2180. Is there generally any land hunger that would increase the natives' wish to work and earn money, or is it only for their needs in food and clothing, &c.?—On account of the limitations of land purchase it is practically useless for him to want to buy land.

2181. That is by law?—Yes.

2182. Of course, those laws might be altered?—Yes. I think if they were altered it might be of advantage in some ways. Of course, you know that a commission is sitting in order to determine the areas which may be set apart for natives. To take the Basutoland case, for example, the natives rather exceed the capacity of the land, partly owing to very indifferent cultivation. Its present population is probably as much as, or more than, the land can carry. I noticed that at the last meeting of the Council, a few days ago, the Resident Commissioner pointed out that he thought that their cattle were also increasing beyond the limit that the land could carry. They balance their wants by working on farms or mines.

2183. And also in regard to this question of employing natives in more responsible positions, that brings you up against the white labour at once?—Yes, both here and, possibly, in other countries.

2184. But you are still in favour of it?—Looking to the future of this country, and having to recognise that it is not like other countries, I think it is the wise course to follow.

2185. Then as regards education, you are not satisfied, are you, with the education of the white?—No.

* Act 25 of 1894.

2186. It is better here than in most places, I suppose. You have it more under control?—Yes. Of course, there are very great difficulties, in country districts especially, owing to the distances which children have to travel. Certainly we should use every possible effort to improve the standard of education of the whites.

2187. Is anything being done to help those children to a useful profession when they leave school?—At the present time we are rather in a state of flux. I do not think that the arrangements that prevail in other countries are suitable here. We have one vocational school, but that is rather intended for children who are able to remain away from work until a reasonable age. We are just starting another to which children will go at a much earlier age, in order to obtain some effectual training before the compulsory age has elapsed. We have also a trades school.

2188. But you do not help them to a choice as to what they are going to do in the school?—Well, there is no official action taken, but the headmasters do all they can.

2189. I do not know whether you have heard of the movement in connection with the Board of Trade at home, started this last year, where they are preparing, with the help of the Labour Exchanges, and the committee of masters and men that sit on these Exchanges, a little handbook dealing with the chief occupations in London, such as building trades, blacksmiths, tinsmiths, and so on, and setting forth in a few pages the wages and the chief prospects of the boy and how long he requires to be apprenticed, and so on?—I have seen them in Edinburgh.

2190. It is quite new in London, but they are to be used in the higher forms of schools as a sort of guide to children. Do you think that anything of that sort would be useful here?—So far we have not got organised to that extent, but I think it is very likely to be useful.

2191. In regard to the industrial schools you spoke of, they are not anything like our workhouse schools, are they? I mean there is no social stigma attached to them?—Of course, in regard to this particular school I spoke of at Uitenhage, it is rather in the nature of a workhouse school, and there are other industrial schools in various parts of the country quite outside our School Board arrangements.

2192. And there are, no doubt, a number of denominational schools?—Yes, a certain number.

2193. Then as regards the people who superintend and manage these schools, you spoke of the advantage of them being born here and possessing a knowledge of the language of the country and local conditions and requirements, and so on? Now would not the public school boy from England have certain advantage in the management of others, from his public school training; also the public school boy here?—I think he has, but then again that applies to a higher standard of supervision than what I am referring to. I was talking more of the ganger class.

2194. But is there much opening here for a public school boy who is used to the management of other boys?—I am afraid not. Of course, you have heard of the "Kindergarten." They were rather senior to those you are now speaking of, and it is extremely to be regretted that so few of them are left in the country to-day. I think I knew them all, and I think they were all men that any country would have been glad to have, and it was very sad to see them going away one by one.

2195. You said that the natives from the East Coast are in very large numbers here?—Yes.

2196. Is that because the Portuguese natives are more efficient than the South African natives?—No. I think if they have any increased efficiency it is due to the fact that they are willing to work for longer periods. They do not change so often. In the olden days if a man came to work for a few months he thereby established himself for life and did not return, but times are changing. The East Coast native has been willing to stay longer on the mines than the others. The statutory period at Kimberley, for instance, for a native in the closed compound is four months. A very usual contract time for an East Coast native is nine months, and in many cases they stay for twelve months.

2197. **(Mr. Lorimer.)** I have made some notes on this most interesting paper of yours, and I would like to ask a few questions for my own enlightenment. You begin by saying that the population of South Africa is about seven-and-a-half millions—do you mean by South Africa the four Provinces of the Union, exclusive of Rhodesia and the territories?—No, I include Rhodesia and the territories—all British South Africa south of the Zambesi.

2198. British South Africa would include Rhodesia and the territories?—Yes.

2199. And you say that of the seven-and-a-half millions the non-whites are to the whites in the relation of five to one?—Yes.

2200. You have also told us this morning that twenty years ago the number of natives at work in the Transvaal was just one-fifth of what it is to-day. I suppose there is no such difference in the other districts of the Union. I mean to say, apart from the mines altogether, the coloured people are not five times as numerous as they were twenty years ago?—No, but at the same time there must have been a considerable increase of workers.

2201. Then, of the 620,000 whom you call half-castes, how are those employed in the Cape Colony; what do they do—house servants?—Yes, and labour on the farms, tradesmen, and artisans.

2202. Are they working on the few mines, like the copper mines?—The asbestos mines, beyond Prieska, are entirely staffed with these men.

2203. Do these half-castes earn any higher wages than the natives?—Yes. Some of them get very nearly the white standard of wages; and then, of course, there is a regular decline down, practically, to the native standard, but even the lowest wage of the coloured man would actually represent more money than the average native receives, because the coloured man would work more continuously.

2204. Then, you say that the white community finds it is in a position to require native assistance to carry on its work; is that the result of custom?—Yes, it first grew up in connection with the diamond mines.

2205. You have a condition of things to some extent analogous to that in Queensland. They carry on work in a climate similar to yours but without coloured labour?—Yes.

2206. This has resulted from the fact that the people are there, and their presence has been taken advantage of by the white people; they have got accustomed to use them and not to do the work themselves?—Yes.

2207. How was that before the mines were opened up?—A certain number of natives worked on the farms, but you see, if the native is prepared to live according to tribal customs, he does not need to do, practically, any work at all.

2208. You would say, I suppose, that relatively to the population there was more white labour employed than there is to-day—I mean to say, that there was more work done by the white people in proportion to the population than there is to-day. The white people did more themselves?—No, I think not.

2209. They have always used as much coloured labour as was available?—Yes. The additional whites as they came in brought more natives out of the territories to work for them.

2210. I rather wanted to get at this, whether the opening of the mines has made any serious difference in the habits of the white people in respect to working?—No.

2211. You also told us that the natives are beginning to work continuously, and that their wants for clothing are increasing?—Yes.

2212. Is this a progressive advance from one period to another; you find steady progress?—Yes.

2213. Then you also told us that this increasing number may acquire a certain amount of skill equal to the least efficient white; does the law prevent that skill being utilised?—May I refer you to the Chamber of Mines evidence before the Economic Commission?

2214. Could you define the poor white? Is he a man who has always been poor—born so of poor white people, or one who has fallen from a better condition?—Very often, of course, he is in the second or third generation, and has gradually been going down.

2215. A shiftless sort of person?—Yes, I daresay you have read Mr. Bryce's book, and you will know the way he speaks of the mean whites in the Southern States of America.

2216. Yes. Do you happen to know if there is any improvement in that class of man, since Mr. Bryce's book was written?—No. The class is certainly there still, but whether they are reduced in numbers or not, I do not know.

2217. You say that this very serious gap should, in the interests of the country, be closed. How would such an attempt to close the gap be regarded by whites as a whole?—I hardly think it is a matter for attempt; it must be a natural development—the native must grow up to it.

2218. But any attempt to remove the colour bar would probably be resented by the trades unions, would it not?—By some trades unions, at any rate. As regards other trades unions, they have already admitted the coloured man to their ranks. So they cannot object to the removal of the colour bar.

2219. Do you think these coloured people really want education?—They are very keen about getting it.

2220. Is there any attempt on their part to get education here when they come—the grown-up men to Johannesburg or elsewhere, or is their desire for education only shown in the native territories?—It is shown everywhere.

2221. And the missionaries do find them willing pupils?—Yes, up to a point.

2222. Of course, we have gathered from your paper and the report of the Economic Commission that you do not regard the education and development of the native races as a menace to the country?—No, certainly not.

2223. Now, in respect to the concessions which you think it would be in the interests of the community to grant to these coloured men, have you thought of their nature and extent?—One could not possibly fix a limit.

2224. Do you mean by that that you would be willing to put them on precisely the same footing as the white population?—No.

2225. That is why I asked whether you had thought of the nature and extent of those concessions. You are not prepared to say?—No.

2226. I suppose it is hardly conceivable that the existing conditions can ever be reversed, and that the coloured people and the white people should be on precisely the same footing, and that if a coloured man was competent he should be allowed to drive a gang of whites underground?—No.

2227. About apprentices; I gather from what you suggest, that one of the difficulties in obtaining apprenticeship is that the lads at a very early age are allowed to take jobs underground as supervisors?—Yes, but it does not apply merely to mining, but to every industry.

2228. That, I suppose, you think is bad? It is not good and cannot be?—No.

2229. Would it help at all if there were a statutory regulation framed fixing the minimum age at which a lad could take a supervisorship?—The Economic Commission asked a number of questions on those lines, and the reply we always received was—what is the use of having an unwilling apprentice?

2230. Of course, he might be unwilling if he had any choice, but if the law prevented him taking such work underground before he reached a certain age he would have to adapt himself to the conditions?—Questions in regard to making certain classes compulsory for those who had recently left our ordinary schools were addressed to a number of teachers, and one of our teachers, for whose opinion I have a great deal of respect, said he did not think that any real benefit would come of it.

2231. What, compulsory?—Continuation classes.

2232. I was over your technical school this morning. There were no students there on account of the holidays, but some of the teachers were there, and I found them all speak very well indeed of the students they have. These young fellows—the students—now attending the classes there will, I suppose, later on become mine managers or something equivalent to that. That, I suppose, is the object of their training—to qualify them for the higher positions in the industry?—Yes.

2233. They have a most admirably equipped metallurgical department, and I was informed that the students are quite enthusiastic about it. I expressly asked whether there were many, or any, who had not worked a year there as students and who went away to positions of supervisors in mines, and they said there were none at all. So the best class of boys are naturally those who want to go through the full course of technical training, and get the ultimate benefit?—You are now dealing with a very picked class.

2234. I think he said they had about 100 students there just now?—Yes.

2235. Well, there is this difficulty about apprenticeship, is there not—on the one hand the employers say they cannot get as many apprentices as they would like, and on the other hand the trades unions limit the number?—Yes.

2236. Has there been any attempt to overcome that difficulty at all?—On the part of the individual trades I think there has. But the number of apprentices required here, owing to the fact that you can use a Kaffir or coloured man, is smaller than in white countries.

2237. Of course, but some day you will have it, that, owing to the industrial development, apart from the mines, you will want the apprentices to be trained to fill the positions which will then be open?—Yes.

2238. And, of course, your technical school is doing a good work just now, although there is only a limited number?—Yes.

2239. There is no regular system of apprenticeship at all?—No.

2240. **(Chairman.)** You are a member of the Liquor Board, are you not?—Yes.

2241. Can you tell the Commission under what regulations bottle licences are granted?—In what way?

2242. What are the restrictions to supplying liquor either to whites or blacks?—They have no right to supply any liquor to coloured people at all. To whites they can sell in the ordinary way.

2243. And they are allowed to sell up to what quantity?—I think up to 11 bottles at a time.

2244. Against cash or credit?—Either.

2245. There is no restriction?—No.

2246. Has the question ever been discussed here?—I am not aware that it has. I do not know if you are thinking of the bearing of that on illicit liquor traffic?

2247. Yes.—Well, these illicit liquor dealers are so well off that, as far as cash is concerned, that would not have any effect at all.

2248. Does not the facility of selling liquor against credit largely increase the illicit traffic?—No, I do not think so. At any rate, the dealer would buy in the same way for cash. In fact I imagine he usually does.

2249. You mean the man actually conveying to the native?—Yes, the man who is one of the intermediaries between the bottle store and the native.

2250. We have heard from certain witnesses that the illicit liquor traffic is increasing; what do you think?—I will put it in this way. I do not think the present law, or the arrangements at present in force, can reduce the amount that is going on. Whether it is increasing or not I could not say.

2251. Could you tell us what the working of the trade is—how it is conducted—this illicit trade?—There are a certain number of people who buy the liquor. They are in the service of certain others who have capital. There are also runners who distribute the liquor.

2252. Who is the large dealer? Is he a firm established in some way?—No, he is not known.

2253. He is a capitalist?—Yes.

2254. With a shop?—No, not as a rule.

2255. What kind of a man?—Apparently nothing at all. The whole thing is underground.

2256. What is his agent nominally?—He might be anything—a canvasser, or anything. Possibly he might be a man who is nominally going out to work on the mines. Of course, they adopt every possible kind of cover.

2257. Let us take the history of the bottle. How is it conveyed from the central store in Johannesburg to the mining compound—what stages does it go through?—From the central store in Johannesburg to a large extent it is taken out to the mines by carts and bicycles.

2258. To where?—Along the mines and at some agreed place it is deposited, probably in a hole in the veldt, or something of that sort. Of course, in addition to that, a large quantity of liquor is manufactured here. I mean, what is purchased from the bottle store does not go straight out. I should like to mention to the Commission one or two instances we have had. In the first place, of course, the Kaffir himself brews spirit. He gets a tin trunk, fills it with potatoes or mealies and golden syrup and then puts water in and buries it in the ground. After about a month it is strong enough to make anybody drunk. To give you an idea of what is sometimes supplied to the Kaffirs, there was a bottle in the possession of the Chief Magistrate here, taken from an illicit seller, containing potato spirit flavoured with chloroform.

2259. You say the present regulations do not conduce to the reduction of this traffic?—They do not enable the traffic to be controlled.

2260. Have you put forward any other proposals or have you in mind any proposals?—No definite proposals at present.

2261. Is any measure practicable which would strike at the root of this traffic?—I would not like to say what is the practical line to follow. Of course, one measure that would go a long way towards it would be the closing of the compounds.

2262. On the Kimberley system?—Yes, but, of course, there are very great difficulties in the way of that.

2263. What difficulties?—Principally vested interests which have grown up all along the mines in regard to these mine stores. But I may say I pointed out some time ago that it did not seem to me that the cost of expropriating these interests need fall very heavily on the community, because if those stores were closed and a similar regulation to that of Kimberley introduced, namely, that the goods had to be sold in the compounds at the ordinary prevailing prices outside, the profits of those stores to which the companies could lay no claim would amount to an enormous sum and would be available to finance any expropriation which might have to be carried out.

2264. I think at Kimberley the practice prevails that all stores sold in the compounds are bought in the town?—Yes. Therefore it would seem that a similar thing might be introduced here.

2265. Have you arrived at any idea of what compensation the stores would receive?—I have not worked it out. It would be very difficult to arrive at any figure by calculation.

2266. Have you formed any opinion on the policy of segregations?—I hardly think it is practicable. No doubt a self-contained white community would be desirable, but the inducement to employ native labour wherever possible, and so fill up gaps, is so great that I doubt if you could introduce segregation, or induce people to carry out such a scheme. And I also doubt whether it would really pay its way. I think I did make a note of that, as a matter of fact.

2267. Perhaps you could hand it in?—Yes, I will think about it in the meantime.*

2268. Have you any idea of the number of poor whites?—No.

2269. Has any census of the poor whites been made?—I cannot say. I have not looked into it.

2270. I understand you to suggest for the native improved technical education—I use the word "technical" as opposed to "literary"; is that so?—Yes, And I think the native himself asks most definitely for industrial education.

2271. Is such education as he is receiving technical or literary, or adequately technical?—No, not adequately technical. The few schools which have technical departments can only turn out a limited number of pupils. And there is the great difficulty there which the Economic Commission points out—that is, the limited field of employment available for the skilled native labourer. Very few whites will employ them except in out-of-the-way places, on the farms, and so on. The amount of employment he can obtain among his own people is also very small.

2272. So there is no good in having technical education for the native unless opportunities are opened for him which do not now exist?—That is so. The technical education which is of value to the native to-day is what he can learn at the bench beside the white tradesman or on the mines. In agriculture, of course, the position is rather curious, because there the native has his own traditional methods, and it is very doubtful whether, as long as this communal system of tenure continues, there would be much use made of training in agriculture. It might help him to grow better crops, but much more certain than trying to grow better crops is to work for the white man for a few months: then the return for his work is certain.

2273. Do you advocate the abolition of the colour bar or its gradual removal upwards?—Its gradual removal upwards, and to keep in touch with native opinion and feeling and watch all development carefully. It has not been carefully watched hitherto.

2274. What has not been carefully watched?—This development of native capacity and feeling.

2275. So your suggestion of a statesmanlike treatment of the question is the gradual removal of the colour bar upwards?—Yes.

2276. **(Sir Alfred Bateman.)** Is the birth-rate of whites in Johannesburg keeping up, so far as you can tell?—We simply cannot provide sufficient school accommodation for the children, but I do not know whether that circumstance can be taken altogether as proof that the birth-rate is keeping up.

2277. **(Mr. Lorimer.)** You said just now that you were in favour of the gradual removal of the colour bar: does that mean industrially?—Yes.

* See Memorandum printed as Appendix VII., p. 110.

Johannesburg, Monday, 6th April, 1914.

Mr. Raymond William Schumacher, Chairman of the Rand Mines, Ltd., called and examined.

2278. **(Chairman.)** You have been good enough to write a memorandum to the Commission on the subject of the mining industry, and the prospects of amalgamation. Might I ask you to read it?

The memorandum was read, and is as follows:—

I gladly comply with the request of the Chairman of the Dominions Royal Commission to prepare a short statement on certain subjects that vitally affect the Witwatersrand. I am Chairman of the Rand Mines, Limited, and also a Director of The Central Mining and Investment Corporation, Limited. These two corporations guide the policy of a large number of gold-mining companies on the Witwatersrand fields. During the year 1913 the gold-mining companies which belong to our group paid in dividends 4,074,096*l.*, equal to 49·7 per cent. of the dividends paid by all the gold mines of the Witwatersrand. During the same period the gold mines that constitute our group crushed 8,444,480 tons, equal to 32·9 per cent. of the total tonnage crushed on the entire fields. I append details.*

I have been asked to make a definite pronouncement on the subject of a general amalgamation of all the Witwatersrand gold-mining companies, which has already been discussed before your Commission. This question was first raised seriously about three

* Not reprinted.

years ago. The chief arguments brought forward in favour of the idea were:—

(1) That the recruiting of native labour in South African territories would be simplified and cheapened.

(*Note.*—At that time various mining groups were competing against each other within the Union of South Africa.)

(2) That the investor would have better security as a shareholder in one great mining concern than as a shareholder in a comparatively small unit where fluctuations and disappointments were more likely to occur.

(3) That during the periods of shortages of native labour, which it was believed would be continuous, chronic, and often severe, all available labour could be used to far greater advantage than it was used then or is used now. In other words, it was indicated that under one big amalgamation scheme the natural policy would be to concentrate labour on mines where reasonable profits could be obtained, and to close down the poor mines where labour was being employed perhaps in large quantities but with little or no profit. In this way no labour would be wasted, the gold output and dividends would be increased considerably, and investment in the Witwatersrand gold industry rendered much more attractive. The poor mines would be worked at some later date when the cost of exploitation would be reduced and the margin of profit greater than to-day.

The idea is certainly an attractive one, and in theory it appears to be almost unassailable.

It was of interest to me to hear Mr. R. N. Kotze, Government Mining Engineer, state to your Commission on the 2nd April, in reply to a question, that he considered the amalgamation of the whole Rand to be certainly in the interests of shareholders; to be an advantage industrially to the country, and to be likely to lead to more contentment among workmen.

The members of our firm gave the matter due consideration when it was first raised, but we at once came to the conclusion that it would be most inadvisable for us to attempt to put the theory into practice. We had only a few years before effected a number of amalgamations of an important and even epoch-making nature, and we were determined to await the results of these amalgamations, about which we were most hopeful, before again allowing everything to be thrown into the melting-pot. The factor which, however, weighed chiefly with us then, as it does now, was that the carrying into effect of one big amalgamation scheme, which might involve the closing down of a large number of poor mines, would create a great upheaval here, the consequences of which it was impossible to foresee.

Leaving on one side the question as to whether it would be possible for the various mining houses to come to terms or whether the shareholders in the companies would be likely to agree, both of which we believe might be possible, we decided that we could not encourage the idea of an amalgamation of the whole of the Rand.

It is well to add here that the first reason quoted in favour of effecting a general amalgamation has fallen away. All the mining groups, with one exception, have for some time combined and formed a joint Native Recruiting Corporation for all native labour within the Union of South Africa.

As long as this Corporation is well managed, we can see no reason why it should not continue its existence, although it was originally formed for only five years.

It must be admitted, also, that the third and most powerful argument quoted, namely, the desirability of wasting no native labour on poor mines, and of concentrating all on the richer ones, is likely to become weakened as greater efficiency is obtained from the natives, and there is no doubt that greater efficiency will be obtained. The argument rests, as I have explained, on an assumed perpetual shortage of native labour; but, obviously, if the efficiency of the labour is improved the shortage, *ipso facto*, is reduced unless other factors are introduced.

In connection with this point I append a quotation from the speech made by Mr. R. C. Warriner at the Annual Meeting of the Association of Mine Managers on the 21st February, 1913,* in which he indicates that at that date a saving of 30,700 boys might have been effected were machine drills being used universally and exclusively, even with a low average duty, instead of hammer boys. These figures apply approximately also to-day.

Allowing for the fact that it may be impossible to use machine drills to advantage in a few mines, it is clear that the further introduction of machine drills, and notably small machine drills, is bound to effect very appreciable savings in the numbers of natives required. The figure quoted above indicates that a general introduction of machine drills would alone make up for something like half the total deficiency of native labour of the entire fields. To-day, machine drills are being used almost exclusively in many mines, and the tendency is to use them on an ever-increasing scale on other mines.

I append also extract from a letter from Mr. A. J. Brett, Manager of the Crown Mines, Limited, addressed to the Consulting Engineer and dated 14th November, 1913,* in which he points out that four years after the amalgamation programme had been carried out, the monthly mine tonnage had been increased by nearly 62,500 tons with exactly the same number of natives working, "that is to say, we have produced the mine tonnage of, say, the Nourse Mines without drawing on the available labour supply for a single boy."

I give the further instance of the New Modderfontein Mine, which can to-day supply 52,000 tons monthly to the mill with about 900 natives less than it could about a year ago, owing to the largely increased use of machine drills and to the carefully thought-out system on which the underground workings have been laid out.

I do not contend that all mines could afford to spend the money to achieve similar results. I am merely indicating what can be done and what, I think, will be done in the majority of cases.

I now turn, briefly, to other subjects:

Sale of Illicit Liquor.

Members of the Commission will have gathered that although the sale of liquor to natives is prohibited in the Transvaal, an immense amount of illicit selling does take place. If the Commission could help us to get this finally stopped it would be doing a really great service to the Witwatersrand. I venture to suggest that in no other direction could the Commission help us more. The regulations at present leave loopholes which ought not to exist.

I append extracts from the Liquor Licensing Ordinances of 1902 and 1906:—

Extract from Liquor Licensing Amendment Ordinance. (Ordinance 8 of 1906.)

Section 14.—No person shall convey or cause to be conveyed from any premises, in any town, village, or municipality to any other premises or to any place any liquor in quantities as great as is mentioned in Sub-section (1) of Section 7 of the principal law unless he shall be in possession of a permit issued by the Resident Magistrate . . . .

Any person who shall contravene the provisions of this section or the conditions of any permit granted under it shall be liable on conviction to a fine not exceeding fifty pounds, and in default of payment to imprisonment with or without hard labour for a period not exceeding three months or to both such fine and such imprisonment, and any liquor conveyed in contravention of this section or such permit shall be forfeited.

Extract from Liquor Licensing Ordinance, 1902, (Principal Law). (Ordinance 32 of 1902.)

Section 7.—In regard to Licences granted under this Ordinance, the following definitions and provisions shall apply:—

(1) (*a*). A "Wholesale Liquor Licence" shall authorise the holder to sell and deliver liquor in quantities of not less than two gallons if in

* Not reprinted.

cask; or one case containing not less than twelve reputed quart or twenty-four reputed pint bottles to be delivered at a time. Such liquor shall not be consumed in or upon the licensed premises.

The position, which is most unsatisfactory to-day, is in danger of becoming worse. For years great pressure was brought upon the Government of the Transvaal, and has also evidently been brought from time to time on the Government of the Union of South Africa, to abolish total prohibition of the sale of liquor to natives on the Witwatersrand, and to encourage the sale of the so-called light Cape wines. In fact, the Government has been urged to undertake the sale of these light wines itself. I say confidently that no measure could be introduced here with more disastrous effects as regards the health of the natives, or as regards the safety of the white women and children who live in close proximity to them. An important section of this community have more than once asked for what is known as local option or the right of local veto. I contend that it is monstrous that this should not be accorded to them. In no place in the world is it more necessary that the people on the spot should be allowed to direct, control, or suppress the liquor traffic.

Trading on Mining Ground.

I enclose memorandum,* containing information on this point, prepared by Mr. S. C. Steil, one of our Joint Secretaries. Many of the trading licences were granted in opposition to the wishes of the mining companies. There is no doubt that it would be very much better for the native if these trading stores ceased to exist; where necessary, compensation should, of course, be given. The difficulty of dealing satisfactorily and radically with this matter appears to have been always exaggerated.

Housing of Natives.

Members of the Commission have seen the report of Surgeon-General Gorgas, in which he recommends the erection of villages for natives on the mines. I shall be pleased to answer any questions on the subject that the Commission may wish to put. Nothing could, of course, be done in a hurry, and any commencement should be made on a small scale.

Housing of Whites.

We have taken a keen interest in this subject. A model village was started last year on one of our mines, the City Deep, Limited, where the men will have an opportunity of obtaining on very advantageous terms full possession of the properties as soon as Township Rights have been granted to the Company. It is expected that these rights will be received within the next few months. It will be seen from the conditions, copy of which I enclose,† that a number of rebates are offered to men who remain in the employ of the Company, or who have large families of young children. It is further laid down that once a man has entered into possession of one of these houses he may remain there as long as he continues to pay his instalments, no matter if he continues in the employ of the mining company or not. He could leave the employ of the Company on the day following his entering the house, and yet remain permanently in possession of the house. This is a privilege which, I believe, has so far not been accorded elsewhere. It is intended to help to settle good workmen on these fields.

General.

I wish to emphasise one point which was touched on by Mr. R. N. Kotze, in his evidence before this Commission. The estimate, prepared by the Transvaal Chamber of Mines for the recent Economic Commission, of 550,000,000 payable tons still to be worked, referred only to the tonnage in the present producing mines on the Witwatersrand and down to an assumed vertical limit of 7,500 feet.

Mr. Kotze has given the interesting information that his own estimate is in the neighbourhood of 580,000,000 tons, and he added further that he calculates roughly that there is likely to be an additional quantity of 580,000,000 from other areas so far unexploited, notably, I think, on the far eastern fringe of the Rand. His total estimate is, therefore, approximately 1,160,000,000 tons of payable ore still to be treated on these fields or in their immediate vicinity. It is interesting to note that only about 280,000,000 tons have been mined on the Rand between the time of its discovery in 1886 and the end of 1913.

According to Mr. Kotze, about 80 per cent. of the tonnage is, therefore, still untouched.

I have had to prepare the whole of this statement very hurriedly owing to the short time accorded to me. I shall, of course, be pleased to supplement any points verbally.

2279. **(Chairman.)** Do we understand that you think amalgamation economically desirable, but politically and practically difficult or impossible?—I think it theoretically desirable, but I see very big obstacles looming in front of anybody who tries to put such an amalgamation scheme into effect.

2280. Obstacles of a mining nature or a political nature?—Chiefly of a practical and of a political nature. That is to say, if the policy were carried out of closing down the poorer mines to enable the richer mines to work to greater advantage.

2281. You quote the opinion of Mr. Kotze, the Government Mining Engineer, and I should like to know to what extent you agree with him. He states that he considers amalgamation of the whole Rand to be in the interests of shareholders. Would you agree with that?—I think it would certainly be in the interests of some shareholders, but it might be a little difficult to prove it would be to the interests of other shareholders.

2282. And he stated further that it would be of advantage industrially to the country?—Yes, if there were no great upheaval. I spoke to Mr. Kotze today about it, because I wanted to be very careful that I did not put any misconstruction on what he said. I think he added in his evidence that there were certain political objections to amalgamation, but he was not given an opportunity of dilating on those objections.

2283. He further stated that it was likely to lead to more contentment among the workmen; what would be your view about that?—I think it is very hard to say. But it is contended by many that if such a policy were carried out, a great impetus would be given to the mining industry of the Witwatersrand, as work could be carried out on a larger scale, and that in this way a larger number of whites would be employed, and that also in this way the inclination towards very frequent changes from mine to mine might be put an end to.

2284. You regard those very frequent changes from mine to mine as producing both unrest and inefficiency?—Undoubtedly.

2285. Do you attribute those changes very largely to competition for the best miners among the various mines—each mine competing against the other?—As far as the miners are concerned, I think that argument undoubtedly holds good, and there is also the tendency on the part of the miners themselves to go to that property where they think they will be able to earn the biggest money. The proximity of the various mines to each other and the facility with which good miners can obtain employment, tends to make them change much more than would be the case if the mines were more isolated. We have a rather interesting example of mines controlled by our firm in Pilgrims Rest District, which is situated a good many miles away from here, and from any other mining camp. The men go there and stay there, and there are very few changes, comparatively speaking. I think that is also the experience in other parts of the world where you have one great camp, the men change to a far greater extent than in the case of isolated mines or isolated small groups of mines.

2286. That greater unrest I suppose exists only where the mines are competing against one another?—Chiefly, but I do not know if that would be the only reason. I understand in the colliery districts at home, which are situated close to towns, there is also

* Printed as Appendix XI., p. 114. † Not reprinted.

a considerable amount of change on the part of the men, whereas in the colliery districts that are more isolated, and away from very large towns, the changes are comparatively rare, and yet the collieries do not compete among themselves for these men.

2287. Would the change from the contract system to a fixed daily wage, plus bonus, ameliorate the present position of affairs?—I think it would tend to do so. Of course, we are working gradually on those lines, but we must be careful not to take any step in a hurry. You cannot suddenly completely abolish the present flat contract system.

2288. Because one mine cannot do it without the others following?—Well, we are not sure yet what is the best method to have instead of it. We have to grope for it, so to speak, to some extent.

2289. Is the Chamber of Mines working harmoniously on this subject?—As far as I know.

2290. I mean to say there is no divergence of opinion between the different groups?—I think there is always a certain amount of reasonable divergence of opinion; I think too that the question is rather how soon such a step should be taken. Some groups would no doubt be more anxious to make the change in the very near future than others.

2291. The point of my question was rather how far that divergence of opinion, if it exists, retarded reform?—I think that when reform is clear, reform will be instituted, but one wants to be quite sure of the reform first.

2292. And the divergence is rather as to the way of introducing the change—rather than as to the principle of change?—Yes.

2293. Can you tell the Commission anything respecting the efficiency both of the white and black labour here as compared with that on other fields?—I think it would be hard to compare native labour here with any other class of labour in other parts of the world. There is not the same class, is there, working elsewhere?

2294. In India, is it similar at all?—I could not say whether the two would be comparable.

2295. Could you give any tables showing the tonnage mined per native as compared with the previous years?—I have no tables prepared, but as I have indicated in my statement, the efficiency of the native —that is to say, the work done by the native, either with his hands, or with the aid of rock drill machines —has greatly increased in the comparatively near past. I mention in my statement the Crown Mines figures for the last month of 1913 which show that with exactly the same labour force as at the end of 1909, they milled 62,000 more tons than in 1909, and I also refer to the New Modderfontein. At the beginning of 1913, the New Modderfontein had a total of 4,600 natives in its employ. During the year, the mine effected various economies, and completed its system of unification underground, and I think I am safe in saying that we can do the same work to-day with 1,000 boys less.

2296. That suggests the idea that taking the field as a whole the native labour force is not now being utilised in the most economical fashion?—That is absolutely certain.

2297. Therefore, if other methods were introduced —more machines or other devices—your present difficulty of native labour might conceivably be wiped out?—Yes, or at all events, wiped out to an appreciable extent. That is the tendency of my argument in the earlier pages of my statement.

2298. That the introduction of more scientific methods would largely fill up the deficiency of native labour which now exists?—Yes, and generally better management—more economy.

2299. More economy in mining?—In the handling and the use of natives—less waste.

2300. Both as to the introduction of machine drills and in other ways?—Yes, certainly. I indicate in my statement that through the more extensive introduction of machine drills you might save nearly half the labour of which we are at present short.

2301. Is there any other large subject of economy, outside the introduction of machine drills?—There is the question of the lay out of the mine, so as to work it to the greatest advantage, and that, of course, applies more to large mines than to small ones.

2302. I suppose that the possibility of economic lay out is far greater in a large mine or unit than in a small one?—Yes, it is, and we must remember that the bulk of the tonnage is produced from large mines.

2303. But is the bulk of the labour absorbed by the large mines?—Yes.

2304. Can you give any figures showing to what extent rock breaking by machine prevails as compared with hammers? Well, I see for the month of December 1913, there were 823,000 hammer shifts worked on these fields. There were also 372,000 machine shifts worked for the same month. This should indicate approximately that there would be 33,000 natives working with hammers and 15,000 natives working with machine drills.

2305. Of those now on hammers, what proportion could work with machine drills?—I think I am right in saying a very large percentage. May I explain? Many mines cannot work with machine drills to the same advantage that they could if they could have a constant supply of hand labour. But in view of the shortage of native labour, which we assume will continue to exist for a very long time, if not always, we in our groups have made up our minds that it would pay us definitely to adopt the machine drills almost everywhere, even if in some cases it is not the ideal thing, and we might use hand labour, if it were constantly available, to greater advantage. But it is no good working for some time with hand labour and then having to change to machines, because such a change is not as easy as it sounds. It takes two or three months to get a stope face that has been used for hand labour into shape for the use of machine drills, and *vice versâ*.

2306. Is it not the case that the introduction of machines increases largely the proportion of whites compared with the number of natives employed?—It would tend to increase, but I think only slightly.

2307. I have been given figures to show that the proportion in the case of machines was about one white to ten Kaffirs, and in the case of hammers one white to 20 Kaffirs?—Yes, but I do not know that that would make a very appreciable difference to the total, and the ratios may change.

2308. That would not be the cause of increasing the employment of white labour?—It would to a small extent.

2309. Now, you state that three years ago you introduced very large amalgamations, and that you desire to await the results of those amalgamations before going further—could you tell the Commission whether these results have been satisfactory on the whole or not?—Yes, on the whole they have been very satisfactory. The figures quoted for the Crown Mines are perhaps the strongest I have to produce. I could, if the Commission would like, hand in a statement prepared by the General Manager of the Crown Mines about eight months ago, in which he dealt with the matter in great detail, pointing out the benefit that had accrued to that property through the amalgamation.*

2310. I think it would be of great interest to us if you would kindly do so. Because the policy of the future in regard to amalgamations must clearly depend upon the success or non-success of past amalgamations?—That is so.

2311. Now, you state also that all the mining groups have recently joined a body called the Native Recruiting Corporation, with the object of recruiting for all native labour within the Union of South Africa. Could you state your views on the general subject of native recruiting—whether you consider the present system is satisfactory?—I think the ideal is, of course, for the native to come up voluntarily and there is a strong tendency for him to do so already. I think the Chairman of the Corporation has put certain figures before you. Five years ago the number of natives that came voluntarily to the Rand was only 9,000 and the year before last, 1912—I am dealing now with natives from British South Africa—the figure had risen to 51,000. For the year 1913, it fell off somewhat, owing to strikes and unrest, but it was still 34,000, so I think these figures go to show that the tendency on the part of the native in British South African territories is to come up by himself if he possibly can. It was put to me quite recently

* Paper read before The South African Institution of Engineers on March 7th, 1913, by Mr. Ruel C. Warriner.

by one of the leading officials that no boy is a recruited boy if he can possibly help it.

2312. Why? Because a portion of the remuneration goes to the intermediaries then?—The chief reason is that the native who comes at his own expense is free to choose the class of work when he arrives here, and he is on monthly notice, so he can leave at the end of the month; and it gives him a sense of freedom that he does not possess if he is tied down for three or four or six months, and yet very often these boys remain longest.

2313. When the boy joins voluntarily does he get any portion of the commission which he would cost if he came under the native recruiting system?—No, that is not arranged.

2314. I think we understood from De Beers or the Premier that they had adopted the plan; would it be expedient?—I think it should be considered. It is much better that the boy should have the incentive than that the money should go for no particular reason to the intermediary.

2315. I think every student of the problem must be impressed with the very large figure of cost, which is estimated at something between 650,000*l.* and 1,000,000*l.* a year, paid to these intermediaries?—Yes, I think it is much too high.

2316. Can you tell us anything regarding the system which apparently prevails under which most of the boys, before they engage themselves to these agents of the Native Recruiting Corporation, are in debt to the storekeepers, and working to get themselves free from debt?—I think it is very difficult to make any definite statement on the subject because there would be so many causes. In some cases, no doubt, the natives get into debt in order to make provision for their families, and in others to buy things they do not require. But I might state that at the end of January of this year there was a small deputation from the mining houses to see the Prime Minister, General Botha, on the subject of the advances. It was then stated to be the intention of the Government to put a stop to these advances to natives within the Union. The deputation consisted of Sir George Farrar, Mr. Chaplin, and myself, and we pointed out to the Prime Minister that we considered that in principle the system of giving advances to natives while being recruited was wrong, and that we should be satisfied if an end were put to the system, but we suggested that it might be undesirable to take steps that were too drastic, especially immediately after the strike that had just taken place, because if there had been any set-back in the recruiting operations it would have meant throwing out of work more white men, which would have been most undesirable in the circumstances. General Botha saw the point, and he agreed that the question of the stoppage of advances should remain in abeyance until the 30th June of this year, when it should come definitely into force. I may say that the Magistrates in some of the principal districts of Cape Colony have sent in recommendations that the advances should not be stopped too hurriedly in districts where there had been a severe drought, and where the native might be unable to leave his home if he had not the means of making some provision for his family before he left.

2317. If the whole present system of recruiting were abolished and the natives were left to find their own way to the mines and engage themselves freely, would that lead to a very grave deficiency of native labour, do you think?—If that were instituted now?

2318. I mean gradually?—I think it is the desirable thing, but we must be careful not to hurry these things unduly, because the whole community would suffer so very severely through any extreme shortage or set-back. It is undoubtedly the ideal thing that natives should come of their own accord.

2319. You go on to discuss the question of illicit liquor. I have asked Mr. Sinclair to examine you on that subject, so I will not refer to it now. Now, in regard to the housing of natives, I gather from your statement that your policy is to introduce changes in the direction of General Gorgas's report of creating locations, but to introduce the change slowly?—Yes, we would like to introduce changes, but the subject is a very difficult one and one would have to go slowly, as I have indicated. The chief difficulty lies first, perhaps, with the expense involved, which would be very considerable, and secondly with the question of the sale of illicit liquor, which hangs over us everywhere in connection with the native on these fields. It would be absolutely essential, if such villages were established, that there should be no facilities whatever for liquor getting into these villages. I may say I have discussed the matter with various Government officials; in fact, I discussed the matter a year ago before General Gorgas had written his report, and suggested something on the lines recommended by General Gorgas himself. After all, one feels that the conditions of housing on these fields as regards the natives are not quite natural, and if we want to make the Rand attractive to the native, which we ought to do, especially in view of the shortage of the labour which is always threatening us, we ought to do more to make their lives resemble the lives they lead in their natural conditions, and while it is certainly true that one cannot bring up families for two hundred thousand natives or so, it is a question whether one should not consider giving the facilities to a comparatively small number of natives to bring their families here, and see whether that does not induce them in the first instance to come here more readily, and in the second instance to remain here longer.

2320. Does the shortness of their present stay or present engagement militate very severely against their efficiency?—Yes, very severely indeed. Our loss in regard to the labour force is in the neighbourhood of ten to twelve per cent. per month, and it must be remembered that the natives who go are those who have become efficient. We are not losing ten or twelve per cent. of our efficient force, but twenty to twenty-four per cent., perhaps, of our efficient force every month on the average, and that is a terrible drawback to the economic working of a great industry like this.

2321. It is almost as far from the scientific ideal as a white force of 13 per cent. moving every month?—Yes, it is a very great handicap.

2322. And if these locations were established on the lines proposed by General Gorgas you consider that the natives would stay permanently or for much longer periods?—Well, that is one's impression. It is very hard for us to say what the native is going to do and to fathom the native mind. But I discussed the question myself several weeks ago with the natives in the City Deep Compound. I let them know I was coming to discuss this subject and wanted them to think it over before I came. I was two hours in the compound discussing the matter with the various chiefs.

2323. And their view was?—That they liked the idea very much. They understood, of course, that facilities could be arranged in the first place only with the permission of the Government, that it would take some time to make the necessary arrangements, and that they must not expect anything immediately. They understood that any village so formed would have to be enclosed and guarded in order to keep out illicit liquor sellers. They realised also that these huts would be given, in the first instance, only to boys selected by the Company as being the best underground boys. It was clearly explained to them that such facilities would be held out as an inducement and reward for boys who were doing the best work. They asked a number of questions, especially the Basutos, who took the keenest interest in it. I may say they were all extremely interested and pleased with the idea, but they had certain objections to raise to the proposal as it was first put by me to them. They objected, I was astonished to find, very strongly to the type of hut that was proposed by General Gorgas, and which I myself thought would find great favour with them, and that was a hut of the native type with a thatched roof. They objected to the thatched roof very strongly; they were afraid it would be too easy for other natives to come and burn them out. The representatives of every tribe to whom I spoke raised that same objection, which they considered a very serious one, and they said they did not want a thatched house. Another native also raised an objection against having a one-roomed hut. He said: "How can I bring my family here and live with them in one room?" And, after all, the objection cannot be considered as an unreasonable one. They inclined to have a two-roomed iron shanty. They asked questions about the facilities that might be given for bringing their wives and

families up, about the facilities for education, and, above all, the facilities for buying stores, if possible, from the Company at not too high prices. They had thought the matter very carefully over and they asked a number of questions and showed they took a deep interest in the subject. I have also had enquiries made at other mines with somewhat similar results.

2324. The upshot of your enquiries would appear to be that if locations were provided there would be keen competition among the best natives to get places in them?—I think so, certainly, as far as I can tell you, and that is also the opinion of a number of authorities upon the subject with whom I have discussed the proposal. I may say that the mine in connection with which I was considering the matter twelve months ago was the New Modderfontein. I had the matter put before the natives there. I wanted their opinion, and I was told that it was distinctly favourable. Since then the Compound Manager has told me that he has been several times approached on the subject by natives and asked whether the facilities outlined by me at an earlier date would be given effect to soon.

2325. Now, turning to what I suppose is the other extreme—the closed compound—have you considered the merits of that as compared with your present system?—Everybody thinks the closed compound is the best system, but everybody is afraid to say so. Everybody is afraid to deal with the question of vested interests of the storekeepers along the Rand.

2326. Is that the only objection to it, or the main objection?—That would be the main stumbling block, I think. All who know say it would be in the interests of the natives to have the closed compound if possible.

2327. The native being, I suppose, the person primarily to be considered in the matter?—I suppose he should have some consideration.

2328. Do you know at all from the natives themselves if they prefer this or dislike it?—I could not say. We do know that the native at Kimberley is extremely happy under the conditions that he works there.

2329. Have you any figures to show the result of that system in the amount of money the native takes home or sends home to his family, or the amount he is enabled to save of his pay?—I could obtain such figures.

2330. I think they would be of interest. We were furnished at De Beers with figures to show that a very large portion of their pay was remitted home through the post office or taken home at the end of his term?—Would you like figures dealing with the British South African boy and also with the Portuguese boy?

2330A. I think it would be of interest to have both?—It will be the nearest estimate we can make.*

2331. Now, turning to another subject, you quote Mr. Kotze's estimate of tonnage still available. Do you consider his estimate to be too optimistic?—Well, I think he is more qualified to make an estimate of that kind than I, especially in his position of Government Mining Engineer.

2332. That is to say, he has access to figures for the whole field?—Not only that, but he is an engineer.

2333. Can you state your own view of the subject at all?—I think there is no doubt whatever that the possibilities of the far eastern Rand are enormous. It is only a few years ago that the New Modderfontein was on the outposts of the Rand; Modder B lay immediately beyond. We had in earlier years done a certain amount of prospecting and development work at Modder B, but it was done on a somewhat timid scale, the results were not entirely satisfactory, and the property was allowed to lie fallow. To-day the Modder B is one of the finest mining properties on the Witwatersrand. It is only a comparatively few years ago that work was started on the Brakpan Mines in an area then entirely unknown. It was considered by many people to be a doubtful venture. Shafts were sunk at a distance of approximately four miles from the outcrop, and the reef was struck at an approximate depth of 3,200 feet in the north shaft and 3,700 in the south. The Brakpan mine to-day is one of the big mines on these fields. Later on again, further away, work was started on the Springs Mines in an area which again was beyond all known districts. The development in that property to-day is not very great, but I understand that about a total amount of one mile of driving has been done, and I understand also that the values on the whole are satisfactory. Four miles or so further east beyond the Springs Mines a large shaft is being sunk on the farm Daggafontein, approximately three miles from the sub-outcrop, which is still further to the east. This shaft should strike the reef at 3,500 feet approximately in the course of the next few months, and it will be extremely interesting to see what the values in that locality are. It all points to the fact that gradually the Rand is extending eastwards, and that large payable mines which comparatively recently were not believed to exist have been found and are being worked at a profit. The area that is still untouched in this district is enormous. In the report of the Chamber of Mines to the Economic Commission it would seem that there are approximately 86,000 claims in this area which may contain reef. Or, at least, of the 86,000 claims mentioned in that report I think it can be taken for granted that the great majority are in that area.

2334. I think of Mr. Kotze's figure of 86,000 claims he assumes that one-third are payable?—Yes, I think he said so.

2335. In one of the annexures to your memorandum you give us the working profits of all working companies as £12,189,000 and dividends at £8,194,000. What is the reason of the difference between those figures?—The difference would be accounted for by such items as payment of interest on debentures, chiefly though by expenditure on capital account out of profits. As far as our own group of mines is concerned, the expenditure on capital account is in most cases drawing to a close now, so that the proportion paid out in dividends is likely to increase in the future.

2336. That is to say, a larger proportion of the working profit will be available for dividends?—Yes.

2337. As regards Mr. Brett's letter which you refer to, I should like to know on what basis under present arrangements are boys allotted to the mines?—The boys who come voluntarily choose their own mines. Recently it has been laid down by the Native Recruiting Corporation's members that the distributions to the various mines must be made as equally as possible, the distributions in the past not having been made equally to mines, notably ours, I think, which have suffered very considerably thereby. During the last month or so, we found it was possible without the least difficulty to allot 88 per cent. of the total boys recruited from the British South African territories to the various mines where they were most required. In other words, there was no difficulty in making these allotments as required by the mines.

2338. I do not understand how you fix the complement for each particular mine?—The complement for each particular mine depends, to a large extent, on the milling capacity of the mine. That is taken as the basis. Other factors are also taken into consideration, such as the nature of the reefs, thickness of reefs, and dip of reefs, and so on. And it is calculated by the consulting engineers that on the basis of the natural conditions of a certain mine and on its milling capacity it should have a certain complement of labour.

2339. Is the complement fixed on the assumption that every mine follows the best practice as regards economy of native labour or not, or do you reward a mine for hanging behind in improvement?—In theory it should be on the basis of the natural conditions so that the mine that effects economies shall have the full benefit of the labour, but it is a very difficult question, and the consulting engineers, I think, do not always follow that line exactly, but follow the line of least resistance, and take the results of a mine for three months and allot a complement accordingly. We have strenuously opposed that, and we shall in future, more strenuously than in the past, insist that any mine that makes economies in the introduction of rock drill machines or better lay-out shall reap the full benefit. We shall lay that down in future as a *sine quâ non*.

2340. The contrary practice would appear to favour extravagance?—Yes, and inefficiency.

* The witness subsequently supplied the information printed in Appendices VIII. and IX., pp. 112 and 113.

2341. If a mine gets a large proportion of boys voluntarily does it thereby diminish the number allotted of recruited boys?—It would mean, if the number of boys working at that mine is in excess of the average percentage working at other mines, it would not receive any labour either from East Coast sources or British South African sources: no allotments would be made. But the intention is, I think, to put up no barrier to voluntary boys coming up at their own expense to work on a particular mine. I think that everything should be done to attract that form of labour, and if a mine can legitimately contrive to attract a large number of boys in that way it should be allowed to reap the full benefits.

2342. There is one point on which your knowledge may help us: we were told the other day that the temperature increases at the rate of one degree for 55 feet?—That is quite wrong. The increase of temperature* in the mines is in the neighbourhood of one degree Fahrenheit for every 245 feet in vertical depth.

2343. Is that rule based on a sufficient number of facts to be certain?—A great many tests have been made in our mines and we have paid great attention to this point.

2344. So that the statement of the Chamber of Mines was quite wrong?—Yes. If it increases one degree for 55 feet, where would we be at 5,000 feet where we are working to-day?

2345. The fact is, I understand, that the temperature increases at depth not so rapidly in this part of the world as in other places: it increases here at a much slower rate?—That is what we find, more slowly here than in any other part of the world.

2346. You consider one degree for 245 feet as absolutely established?—Yes, as far as our knowledge to-day shows us. Of course, whether the ratio of increase will grow less or greater as we go deeper I cannot say.

2347. **(Sir Alfred Bateman.)** I should like to ask a little about this amalgamation: I gather you are in favour of entire amalgamation?—No not exactly. I see big difficulties, and, as I said before, when the matter was first seriously discussed, as far as our firm is concerned, we made up our mind we could not take the thing in hand at all.

2348. Are you in favour of it, because of the advantage you would get in buying: you would have no competitors in buying for the mines?—I must make it clear, from the outset, that I am not greatly in favour of the idea.

2349. Then you don't want me to pursue the matter?—Yes, if you wish the subject to be discussed, but, as I say, I myself am not a strong advocate of this big amalgamation, seeing the great difficulties that lie before us—that is assuming that the policy would necessitate the closing down of a large number of poor mines in order that the richer mines would work to better advantage. That is where the difficulties come in.

2350. You speak of closing down a number of poor mines. But would there not be the possibility of opening a number of poor mines also? If you got more efficiency, as a result of amalgamation, you would be able to work poor mines which to-day it is hardly possible to work economically, would you not?—I do not quite understand the question.

2351. It seems to me that you speak of two tendencies—one, that you would immediately close down a number of poor mines?—Not that we would.

2352. No, I mean the combine, if I may so call it?—Yes.

2353. But then, from year to year, as you increased in efficiency you would be able to open poor mines?—Yes; if they were payable.

2354. The very effect of conducting things more cheaply and efficiently?—The question is whether the amalgamation would help you to work more cheaply.

2355. You do not think it is proved?—I think it is a debatable point. I see there are a number of advantages, but I think it is a debatable point. You see a paper amalgamation would not immediately mean an effective amalgamation as far as the underground working of many mines is concerned. Many independent units would have still to be worked practically as independent units for a considerable number of years, even if everything were done to bring them into line. It took us at the Crown Mines with every effort and with great expenditure four years to unify the mine and work it as one whole, and it would take a considerable time to unify your various mines so that you would be able to work them cheaper than you can to-day. It is open to question whether they could not be unified in some way to advantage possibly without such a sweeping amalgamation.

2356. The first thing is that you would scrap a number of Boards of Directors?—Yes, I suppose they would be the first to go.

2357. That would not be very popular?—Not among the Directors.

2358. In getting rid of your gold there would be no particular advantage. You do not sell your gold at competitive rates?—No.

2359. There would be great savings in salaries?—I do not admit that there would be great savings in salaries. I think that is a debatable point. You see you could not work a great area like the Witwatersrand by one man. If you did amalgamate—supposing it were feasible to amalgamate the whole area and there was no serious opposition, and you could carry it into effect—you would have to split up the area into various districts and organize each district with its own staff, and have people definitely responsible for that district. It is not clear to me that the saving of salaries would be very considerable after all. The main point is, I think, that you would, under the scheme of general amalgamation, be able to throw your labour forces where most required and not fritter them away on poorer mines as they are to-day. That is the one argument that appeals to me.

2360. Then there would be a great monopoly of employers. Now if a man gets dismissed to-day he can go elsewhere, but under amalgamation he could not do that?—Not under a proper system of management if a man had committed any serious offence.

2361. Do you contemplate that there would be a large Union on the other side to bargain with you?—Yes.

2362. So you would have these two great forces bargaining, as we know is often the most satisfactory manner of settling a dispute, rather than a number of separate units?—Yes, if the leaders are good men.

2363. You contemplate having very good men as your leaders?—We would hope so under that scheme. I want it to be clearly understood, however, that my firm is not recommending this scheme. We would have to be convinced that it was most desirable.

2364. Would not the Government be likely to interfere with you more with this great monopoly than now?—I think it would.

2365. To the extent of wanting to take it over?—Possibly, if it became a very important factor in the State. The Government might think it would be in the interests of the State that it should be controlled by the State and not by a private owner. I think that is quite possible.

2366. Then, on the whole, you have rather an open mind on it?—A very open mind. We should require a great deal of convincing to make us support the scheme, although, in theory, we admit it is attractive. The upheaval we fear would be very great if any such policy were to be introduced as indicated, by shutting down the poorer mines.

2367. Now, in regard to the drink question. You are very much opposed to extending the sale of light Cape wines to the native?—Any wines or liquor.

2368. Have you had any experience with the Portuguese natives who have had light wine before coming here?—Yes. It is the policy of the Portuguese Government to sell as much Portuguese wine as possible for revenue purposes.

2369. A bottle a day each, is it not?—I could not say. That is the same policy that many politicians in the Cape Colony would like to see adopted here as regards the sale of Cape wines, quite irrespective of the health of the natives.

2370. Do you consider that the health of the Portuguese natives has suffered owing to this bottle a day policy?—It think it may be assumed that the wine

* *Witness's Note.*—The increase in temperature refers to rock temperature. The temperatureof the AIR can be kept lower by artificial ventilation. See also Appendix X., p. 113.

they supply is very bad and often strengthened by brandy or some form of intoxicant of an undesirable nature.

2371. Have you the right to assume that?—I think there would be no difficulty in proving it. I am not talking of the wine that is sold in Portugal, but the wine that is sold here.

2372. I am thinking of the Portuguese hock that is drunk throughout Portugal, which, I was told by the Portuguese people some years ago, was the wine supplied here?—Yes, I do not know that it is sold in the same form as it is introduced.

2373. But you do not think there is any possibility of getting this type of wine drunk by the natives?—I hope not.

2374. Why not?—Because I think one should not play with the devil. I think it would be absolutely disastrous to encourage the native to drink.

2375. They won't drink light Cape wines?—I do not know if you have ever found a light Cape wine.

2376. Well, I admit they are better for a little Riebeek water in them. But wine-drinking countries usually show up uncommonly well as regards the absence of drunkenness, do they not?—Some say so, but in European countries they drink the lightest of light wines, which do not stand transport to this country. The wine that would be sold here would not be the same as is sold in Portugal or any other wine-drinking country.

2377. But you get the Cape wine produced here, and there is no transport?—But it is very strong and it would be further strengthened if it was to be made palatable to the native. He does not want light wines, they are no use to him. The native cannot be considered from the same standpoint as the European in this matter of liquor; he is differently constituted and has not the same restraint as the average white man. I think if he was encouraged to drink any form of intoxicating liquors you would render him inefficient and dangerous, and this opinion is also very strongly held by all the churches.

2378. Do you go further as regards the sale of liquor to whites?—My own impression is that if you are to make the prohibition of the sale of liquor to natives absolutely effective, the best thing would be to stop the sale to whites also.

2379. Would you do it by disqualification on account of drunkenness, or by local option, or by prohibition?—I think we must begin slowly; you cannot take too drastic steps all at once, you would have to begin with local option, and I think the people ought to have that right.

2380. In small districts?—I could not say what the size of the districts should be—that would be a matter which would have to be referred to some representative board.

2381. Do you not think that a great hardship would be inflicted on the moderate drinker by being prevented from having his glass of beer or wine?—I think that although that might be the case in European countries, the case is rather different here. Here you have a comparatively small number of whites surrounded by a great number of natives. Now the white drinker must consider whether under the special circumstances of this country he should not be prepared to make some small sacrifice so as to safeguard the honour of his women—leaving out of consideration altogether the comparatively minor point of the efficiency of the native working on the mines.

2382. As in regard to other matters, you think the question is entirely altered in this country by the presence of this large coloured population?—Undoubtedly.

2383. **(Mr. Sinclair.)** I want to ask one or two general questions, and then something on the subject of trading stands, and also on the subject of liquor. Now, if further amalgamations were to take place—and we have heard your personal opinion that you are not in favour of them—would one result be the lessening of the daily pay of the worker? It is impossible for me to say, but my own feeling is that there is no need to reduce the wage of the white worker. My feeling is that everything should be done to increase the efficiency of the worker, and the output of the white worker. You want more work than is being done to-day. Taking into consideration the high cost of living and various other circumstances, it would not be wise, in my opinion, to endeavour to make any reduction in the standard rates of wages.

2384. Do you think that such amalgamations would result in a less daily wage to the black worker?—I do not think the daily wage would be affected at all by the amalgamation. I think also it would be most impolitic to try to cut down the wage of the native. You must do everything you can to induce the native to come and work, and you must do all possible also to increase the efficiency of both white and black. Given a shortage, you must try and overcome it by extra efficiency.

2385. Does the management of the companies assume that in the future the working of the mines will involve a higher daily wage than is paid now? Apart from economics?—Are you speaking of the native?

2386. Of both. You may deal with them separately. My own feeling in the matter is that the tendency will be to pay more, but you will get better work done for it.

2387. In the case of whites and blacks?—Both. I do not say that the miner who is earning a very big cheque to-day will get much more in the future. But I think the tendency will be for the management to encourage the workers to do their utmost and pay them accordingly. To-day, we are on the whole not getting full value—especially from the whites.

2388. Then the higher wage that may reasonably be looked forward to in the future will have to be met by economics in some direction?—Yes. You will get higher efficiency for one thing. You do not pay more unless you get more work done.

2389. The use of machine drills would be an economy apart altogether from the economy that might be brought about by amalgamation?—It is a difficult question to answer definitely. I could not say there would be any actual economy as far as breaking rock is concerned. That is to say, assuming that the drills were running efficiently and economically, and assuming also that hand labour is well used.

2390. Then amalgamation would result in less competition for labour. That goes without saying?—That would refer to only one class of labour, and that is the good miner. To-day there is active competition on these fields only for the good miner—the really good miner, who is rather scarce. There is a very ample supply of workmen of all other descriptions.

2391. Then the saving that would be brought about would be probably that lesser numbers would be employed, and that the individual worker would be getting more than now?—Through the greater use of rock drill machines?

2392. Yes.—Yes. I also think that economics will be effected in the use of rock drill machines. You will also get better duty from each individual machine. The tendency is towards improvement. But I do not think that rock drills will effect great economy as against hand labour, although it may possibly be so.

2393. And the worker is not to be looked to to provide the impetus to mining and to lessen working cost by himself taking a less daily wage? That is the point I want to get at?—No. I think it would be very unnatural if one did look at it in that way.

2394. Just one question as to recruiting. One of the difficulties that has to be met, and one of the influences that has to be faced, is that of the chief, is it not? He is unfavourable to his boys going to work in the mines, is he not?—Sometimes, but not always.

2395. We had it put before us by a native on Saturday* that the chiefs were in many cases very strongly opposed to recruiting, and used their influence to prevent it?—I think you will find, if you ask an expert on native affairs, that many of the chiefs are really anxious for the natives to go out to work in order to get money.

2396. You think it is a divided opinion?—Yes.

2397. We had evidence from two natives on Saturday who put forward that as their opinion. Now in regard to trading stands on mining ground—what is the definite purpose of allowing these trading stands?—On the part of the Government?

* See Appendix XVIII., pp. 119-123.

2398. Yes.—I think they do it to derive revenue.

2399. Is it done for the convenience of the worker, or are they licensed for revenue purposes?—I should think for revenue purposes almost exclusively, because the natives can be freely supplied in other ways. The Government and the mines have never been able to work hand in hand in this matter.

2400. Then you suggest that these licences are granted and these privileges are conferred in order to produce revenue for the country?—Well, I think that is the main underlying idea. There may also be a certain subsidiary political aspect of the question, which perhaps need not be discussed.

2401. They were established, as I gather, in opposition to the wishes of the mining companies?—In a great many cases.

2402. Can you tell us in what articles the grantee of such a licence is allowed to trade? General merchandise, I take it?—Yes.

2403. Is he allowed to keep liquor?—He is not allowed to keep liquor.

2404. He is not allowed to keep liquor either for the supply of white or black?—No, but, of course, the temptation in some cases has been very great for the storekeeper to keep liquor and sell it. Take the instance of the Modder B. We are out on the veldt there, and we had the strongest objection to a store being put up against the compound doors, so to speak, but the Government insisted on it, and they put the stand up to auction and received a tender of 2,005*l.* per annum for the use of this store. Now, how is a man going to make a legitimate profit if he is going to charge a reasonable price for his goods, and if he is not going to sell liquor? But that price, I may say in fairness, has been reduced since.

2405. In other words, the licensee of such a right is rack-rented by the Government?—Well, I think that would be rather an exaggeration of the position to-day, because the position has been improved by the reduction of those figures.

2406. It has been reduced from 2,005*l.* to 110*l.*?—Yes, in that case. This was done while I was in Europe. The man received the right to hold it for ten years. Now we should have opposed that, if we could have done so with any chance of success. We have the strongest possible objection to vested interests being formed by the Government in this way.

2407. The ground of objection I understand you put forward as representing the company is that the system is unnecessary and is open to abuse?—Yes, in many cases it is abused.

2408. Have there been many instances of the Government licensees selling liquor?—Nothing has been proved.

2409. But the knowledge you have seems to suggest, in view of the position you put forward, that there are abuses that are against the best interests of the worker?—Undoubtedly there are loopholes in the regulations which facilitate the selling of illicit liquor, and these loopholes have not been rectified.

2410. You use the word "loopholes" in your statement; have you in mind any particular shortcomings of the existing system?—Yes, I have in mind the clause in section 7 of Ordinance 32 of 1902 of which I have here a copy.

2411. Yes, I was going to ask you if you could let us have complete copies of both ordinances of which you give extracts. It is as well to have the whole context and not merely one or two clauses?—Yes, with pleasure.*

2412. What were the loopholes you were going to refer to?—The fact that a man can hawk about anything up to 12 bottles of liquor at any time and anywhere he likes.

2413. That is in terms of the Ordinance of 1902 of which you have given an extract?—Yes, and also the Ordinane of 1906.

2414. Is that done in practice?—Undoubtedly. That is said to be one of the chief difficulties of the police to stop any man in the possession of liquor. He has a perfect right to carry about anything under 12 bottles. If the authorities wish to put the matter right—I am not speaking of the police authorities, who do their best under the circumstances—they should put a stop to liquor being transferred from place to place in this way.

2415. It is the facilities for the hawking about of liquor which are provided under the present Act which facilitate this illicit traffic?—Undoubtedly.

2416. Now, liquor may be sold by the bottle, I understand?—Yes.

2417. Does that fact also facilitate the illicit sale of liquor?—Undoubtedly. It is more easily carried in bottles than in casks.

2418. Would you favour the abolition of the bottle licence altogether?—Certainly the hawking about of liquor.

2419. Well, can you see any advantages in the sale by stores of liquor in bottle under any circumstances except in emergency?—Yes; I see advantages to the grower of the Cape brandy and the Cape light wines, who has the liquor sold in that way. But to nobody else.

2420. And can it not be disposed of in bulk too?—Yes, but it would be more difficult of detection.

2421. But where liquor can be sold in bottles by a store it facilitates, does it not, the sale of the bottle under the denomination of butter or some form of groceries?—Certainly.

2422. Now, as regards whites; can the white be sued for the price of liquor if credit is given? We had it put to us the other day that he could?—It appears to be that the money cannot be recovered. But I would rather give you an answer to that question in writing, which would be absolutely correct.*

2423. Probably if you supply the complete ordinance we would be able to see for ourselves. You are also strongly in favour of the right of the people to local option?—Yes.

2424. And if there is one district more than another in any locality that would be benefited by the carrying of local option it would be the mining district?—Yes, especially where there are 200,000 natives.

2425. One effect would be to protect the native who is least able to protect himself?—Yes, and who requires a great deal of protection against the lower class of white man.

2426. It would seem that it is contemplated that very large sums shall be received by the Government by way of rental for these trading stands in view of the sliding scale that is provided. I see that it is three per cent. of the takings up to 3,000*l.*—3½ from 3,000*l.* to 6,000*l.*, and four per cent. on 6,000*l.* and over, and the freeholder of the ground receives no share in that rental. It goes entirely to the Government, does it not?—Yes. The freeholder has never put in any claim for any share in the profits of this thing. We do not want it. We would rather that the profits were not made, or, if they were made, that they should be used, as under the Kimberley system, for the benefit of the native.

2427. I see that the schedule of amounts which you supplied to us supports the view which you are putting forward now. The sums which seem to have been received by the Company from the lessee of the stands are small: I was going to ask if the Company would be prepared to give them up altogether?—If we could get the whole question of stores put right, we should be pleased to abandon any claim to any form of revenue we have.

2427A. You do not encourage this trading. But, in the meantime, as long as the system lasts, the Company does get these small annual sums. But you would rather be without them?—Yes.

2428. **(Mr. Lorimer.)** Would the effect of the proposed amalgamation be that, for practical purposes, there would be only one employer of mine labour on the Rand?—I think so, assuming that the amalgamation could be put into effect.

2429. With the consequent elimination of all competition for labour?—Are you referring to white or black labour?

2430. I was thinking of white labour.—I was saying just now that there is competition to-day for

* *Note.*—Copies of the Ordinance were subsequently furnished.

* The witness subsequently referred the Commission to Section 82 of Transvaal Ordinance 32 of 1902 as revised by Section 13 of Ordinance No. 8 of 1906, which runs as follows:—"No persons shall recover any sums of money or maintain any suit at law on account of any liquor sold by him on credit to any person for consumption on the premises, except in the case of liquor supplied in moderate quantities with meals to any person actually boarding or lodging with such first-mentioned person."

only one form of labour, and that is the good miner. The other men we can get as we want them.

2431. And under amalgamation that competition would disappear?—Yes.

2432. So that if a man were dismissed from employment here the chances are that he could not find another employer on the Rand, and would have to go elsewhere?—If he were dismissed for a serious offence.

2433. And that might, therefore, possibly result, as you put it, in a certain upheaval, which you are not prepared to face?—Yes, but that would not be the only cause the upheaval, I think.

2434. And you also think that a monopoly would involve increased and, perhaps, undue Government interference?—Yes, although there is a very considerable amount of Government interference to-day.

2435. And there might be more?—It is conceivable.

2436. And you think it might even involve expropriation on the part of the Government?—Yes; I said that in reply to a question of Sir Alfred Bateman.

2437. One more question: In Mr. Brett's letter of 14th November, 1913, part of which you quote in your statement, a comparative statement is given of the work done in January, 1910, and October, 1913. The tons milled had increased during these four years by 40 per cent.; the gold recovered by only 13 per cent., nevertheless, there was a reduction in working costs of 2*s.* a ton, with an increased profit of nine per cent. Now, is all that the result of more efficient working?—Yes; it is the result of having unified the mining work underground, of having turned a series of separate units into one working whole and also to the fact of the more extended use of rock drill machines, which enabled us to break a much larger tonnage of rock with a given force of native labour.

2438. Well, there appear to be a number of contributory causes. Are those in operation now?—Yes.

2439. One might look for a still further reduction of working costs, then?—Yes, there is a still further reduction. We expect for the month of March to have working costs at 15*s.* a ton, and that figure is expected to be reduced in the near future.

2440. That is, from 15*s.* 10*d.*, in October, you hope to bring it down to 15*s.*?—Yes. We did so last month, and we look for a further reduction before long.

2441. In regard to the illicit liquor traffic, I am not quite sure what you mean by local option. What options would you offer the people to vote upon?—The option of retaining the present number of licences, of reducing that number, of increasing it, or of abolishing them in certain districts altogether.

2442. Then, it is conceivable, there is a risk of making matters worse by increasing the number?—I do not think so.

2443. Do you think you would have a chance of getting a vote for abolition?—I think so, later on. I think the place is not ready yet, but I believe it is working that way.

2444. **(Mr. Tatlow.)** With regard to native locations or villages, would it be desirable to try the experiment on a small scale at first, and see how it succeeds from the native's point of view and the employer's point of view?—My personal view is that it would be most desirable, and, if we could get the support of the Government as to the effective banning of liquor, we would like to try the experiment on one or two of our outside mines and make a start almost at once.

2445. Would you not start it except the banning of liquor was introduced?—No, we would make no move whatever.

2446. You had some very interesting conversations with the natives on the question, and they appear to be in favour?—Yes; they also expressed the view that liquor should be kept out of the villages, and anyone found guilty of this offence should be expelled from the village. They considered that would be only justice.

2447. They were in favour of establishing locations?—Yes; and they asked in some cases for facilities to bring their families.

2448. If such locations were established experimentally, would they be confined to married men?—We would confine it to married men. But I should make it clear that in other parts of the country it is done already. It is done almost everywhere except on these fields. It is the normal thing.

2449. It would tend to lengthen the term of the men's service, you think?—Yes. I might quote an interesting example. About twenty years ago there was a mine in the Pilgrims Rust District called the New Clewer. Boys were brought down there and lived in a compound. They died in excessive numbers, so that the natives were most unwilling to come. The management then took the matter in hand, and they said, "We must try to do something quite new. We will let them build their own little huts on the slope of the hill." Well, they allowed them to do this, and the result of the natives living under natural conditions was that the death-rate immediately fell to something abnormally low.

2450. But if you provide a location such as you speak of you propose to build the houses yourselves?—Yes, it would be necessary, where you are in proximity to townships with large numbers of whites living round about, to take greater precautions from a sanitary standpoint.

2451. Would the native have the option of purchasing his house?—I think not. I think he would be given to understand, however, that as long as he did good work he would be left in possession.

2452. Whilst you are not in favour of general amalgamation, the amalgamations which have taken place, you say, have been eminently successful?—Yes.

2453. Particularly in dealing economically with native workmen?—Yes.

2454. That being so, is it likely that further amalgamations will take place in a moderate degree?—I think it is quite possible from time to time. But I do not foresee any important amalgamations in the near future. Markets all over the world have been bad in the past, and shareholders in South African securities and others have lost money, and they say "For heaven's sake leave these things alone." The attitude is very strong now that there should be no shifting about.

2455. Still, what has been done has been to encourage amalgamation?—Yes, and no doubt when there is a clear case it will be dealt with.

2456. You spoke of the growing efficiency of the native workmen: do you look forward to further efficiency?—There is still a great margin for further efficiency, but it is a fact that on the majority of the mines efficiency has improved.

2457. Is the native growing more industrious?—No, it is better organisation.

2458. **(Mr. Garnett.)** While, generally speaking, you are not absolutely convinced of the advantages of amalgamation, there is one point I should like to put to you. Mr. Kotze said it is likely to lead to contentment among the workmen. Does he refer to white or coloured men or all?—I could not tell you. I read this paragraph to him this morning, and he confirmed that it represented what he said.

2459. I take it he meant the white worker. Of course, assuming that there is a large amalgamation, you would then be a close corporation of employers, and there would not be the competition there is to-day to get hold of even the skilled miner. There is, we are told, a good deal of changing about from mine to mine?—Yes.

2460. That is in pursuit of what is called the big cheque?—Yes, to a large extent.

2461. Suppose that competition to be eliminated, inasmuch as some mines would probably pay better to work than others, how would the workmen be allocated, so to speak? Would they be confined to one particular mine, or would it eventuate in a sort of standardization of wages?—It is very hard to say what would happen.

2462. Because assuming that men working on the less remunerative mines could not improve themselves by going elsewhere I cannot see how such a system could lead to contentment?—Personally, I should not be very anxious to have to manage the amalgamated mines of the Witwatersrand.

2463. Unless there were some standardization of wages applying to the same class of workmen throughout the mines, it is not, in your opinion, likely to lead to contentment among the men?—Well, it is perhaps a debatable point.

2464. But you are not convinced?—I am not convinced that the whole scheme could be carried out at

all. I am speaking of conditions as they are to-day. What the conditions will be like in seven or ten years' time, I do not know. I am not referring to those periods.

2465. Now, certain figures have been put to you in regard to the use of drills, and you were asked whether the use of drills would increase the number of white men. The figures put forward, I think were, hammermen 1 to 25, and machine drills 1 to 10. Does that arise from the increase in the number of whites or the decrease in the number of natives? I will put it in this way: assuming it were possible to work drills everywhere in every mine, would that reduce the number of your native boys?—I have given Mr. Warriner's indication that the saving would be something like 30,000 natives.

2466. What percentage would that be? Does that tally in regard to the figures of 25 and 10?—I do not know whether the ratio can be applied. One man can supervise 25 natives on hammers, but he could not supervise many more than ten on machines on the average.

2467. But you cannot tell me whether the reduction of boys on machine work is commensurate with those figures? I mean what is the productivity of a boy working on a drill as compared with hammers?—Approximately, you can take it like this. A boy breaks an average of, say, ·8 of a ton per shift on hammers. One machine, at which an average of 2½ boys are working, will break, taking the mean of large and small machines, say, 8 tons. So you have 2½ boys breaking 8 tons on machines as against one boy breaking ·8 of a ton with hammers. The ratio would be about four to one.

2468. Then it seems there would be some increase in white labour?—There would certainly be an increase, not only through this ratio—that would not be the only thing—but through the fact that you could work on a much more extensive scale.

2469. You say the Government is proposing to abolish all advances to storekeepers. Have the storekeepers power to get the wages of these recruited boys attached for their debts?—No.

2470. Could you tell us how the Government and public opinion views such a proposal as that put forward by Surgeon-General Gorgas?—The matter has not been discussed with the Government yet. But his report, as far as native villages are concerned, seems to be quite on commonsense lines.

2471. You say that the shortness of time for which these boys engage militates very much against their efficiency, but can you say, in the case of a boy who returns to this employment, after having taken a holiday, so to speak, how his physical efficiency is kept up? Does it deteriorate after a long period of service?—Possibly.

2472. And they are rehabilitated, so to speak, by a visit to their kraals, and they are more efficient physically when they come back after a rest?—Yes, I think so, especialy in the case of boys working underground in the dust. I think it is most desirable that they should go away for a time, just as it is most desirable that white men should go away sometimes, although the conditions now are infinitely better than they used to be.

2473. But, generally speaking, can the loss of working efficiency be made up by the increased physical efficiency arising from this change and rest?—Yes. And I think, if you had these proposed villages, and a certain number of underground boys located in the villages near the mines, it might be possible to let these boys off work for a certain period every year to give them the necessary rest.

2474. So that the shortness of their term is not an unmixed evil?—No, particularly for the kind of boy who may have been working at unhealthy work.

2475. Now, I gather from what you say, there are powerful trade influences working in regard to liquor?—Yes, the liquor influence is powerful all over the world.

2476. And I also gather from your evidence that, having regard to the great evils of this traffic and the mischief done to the native himself, and also to the social dangers that there are from giving these people drink, that you are in favour of total abolition of liquor? I mean to say, you would go so far?—Yes, I think we should work in that direction. You cannot, of course, do that to-day: you cannot go so far—you must have public opinion with you.

2477. You are of opinion that, having regard to the class of outrage that might be committed and the consequent reprisals that must inevitably result, this is a sacrifice or deprivation that the whole community might very reasonably be asked to make?—Yes. The Commission which was appointed to enquire into what was known as the "Black Peril"*: recommended the closed compound system, which would, of course, have the same effect as total prohibition.

2478. At any rate, sooner than having to resort to lynching and such like measures, you think that the white community might fairly be asked to agree to deprive themselves of the privilege of purchasing liquor?—Surely, if they have to weigh on the one hand the honour of their women and, on the other, the attraction of their drink, they will have no hesitation in deciding which is the best course to take.

Mr. S. A. M. Pritchard, Director of Native Labour, called and examined.

2479. **(Chairman.)** You are Director of Native Labour?—Yes.

2480. You have been good enough to prepare a memorandum for the Commission. I do not think we need trouble you to read it, but I should like to ask you certain questions in elucidation of various points.

The following is the statement furnished to the Commission by the witness:—

Report of Economic Commission.

I agree with conclusions Nos. 7, 8, and 9 of the Economic Commission* as they appear on page 69 of the report.

"(7) Complaints on the part of the natives as regards wages on the Witwatersrand are common, and the system of the maximum average wage prevailing there is especially objected to."

"(8) The productivity of the natives could be increased by giving more attention to the organisation of their work, and, where it is possible, adopting more generally the piece-rate system, particularly on the Witwatersrand Gold Mines."

"(9) In the skilled trades the competition of natives and Indians is negligible, and the white skilled artisans do not appear to be losing ground as a result of the competition of coloured people."

Surgeon-General Gorgas's Report.

I support General Gorgas's recommendation as to the desirability of establishing native villages in mining areas wherever practicable.

The Department will be prepared, if necessary, to amend the Native Labour Regulations governing the accommodation to be provided for native labourers in order to enable employers to give effect to General Gorgas's recommendations in this respect.

With regard to General Gorgas's recommendations as to diet and other matters, support as above indicated will be given by the Department to employers.

Wages.

Average wages paid per shift to native labourers by mining companies affiliated to the Chamber of Mines:—

	s.	d.
Gold Mines (Witwatersrand Area)	1	11
,, (Outside Districts) ...	1	7½
Coal Mines	1	6·4
Diamond Mines	3	0

* U. G. No. 12, 1914.

* See "Union of South Africa. Report of the Commission appointed to enquire into Assaults on Women." U. G. 39, 1913.

Particulars as to Recruitment and Employment of Native Labourers on Diamond Mines.

Premier Diamond Mine.

(1) Average number of natives employed during 1913 14,548

(2) Average wages per shift paid to native labourers ... ... 3*s.*

(3) Average sum spent per native per diem in Compound stores:—
(*a*) for purchase of food-stuffs, 11*d.*
(*b*) other articles... ... 8*d.* } 1*s.* 7*d.*

(4) Total remittances made by or on behalf of native labourers during 1913 ... ... 15,617*l.*

(5) Number of natives recruited during 1913 16,215

(6) Number of voluntary natives ... 5,671
(or 25·9 per cent. of natives engaged)

(7) Total cost of recruiting during 1913 60,552*l.* or 2*l.* 15*s.* per native.

The Company has recently reorganised its recruiting arrangements and now employs only one actual recruiter, salaried employees being stationed at various places to provide facilities to natives desirous of being employed on the mine.

(8) Of the total cost of recruiting during 1913 (60,552*l.*) 7,900*l.* was paid in bonuses. (A bonus of 1*l.* is paid to voluntary labourers on their arrival at the mine, and to all natives on renewing their contracts for a period of three months.)

The Premier Diamond Mine has little difficulty in securing native labour as compared with that experienced by most gold-mining companies. I attribute this to the following reasons, among others:—

(*a*) The short period of contract (3 months).
N.B.—It is noteworthy that whereas the original contract is for 3 months only, the average duration of the stay of a native labourer is 5½ months.

(*b*) Attractive nature of work (open workings).

(*c*) The reputation of the mine for liberal and sympathetic treatment of native labourers.

(*d*) The good wages, with the "sporting chance" of earning a considerable commission on diamonds found.

(*e*) System of bonuses paid to voluntary labourers and those re-engaging.

(*f*) Arrangement whereby natives are allowed to ration themselves.

De Beers Consolidated Mines.

(1) Average number of labourers employed during 1913:—
Natives 14,018
Coloured Persons ... 1,020
Convicts 1,353
16,391

(2) Average wages per shift paid to native labourers ... ... 3*s.* 4·92*d.*

(3) Average sum spent per native per diem in Compound stores:—
(*a*) purchase of food-stuffs, 9½*d.*
(*b*) other articles ... ... 4*d.* } 1*s.* 1½*d.*

(4) Total remittances made by or on behalf of native labourers during 1913 ... ... 91,218*l.*

(5) Number of natives recruited during 1913 4,449

(6) Number of voluntary natives... ... 35,421

(7) Total cost of recruiting during 1913... 1,547*l.*

In reply to the enquiry as to how it is that De Beers experiences no difficulty in securing native labour, the Protector of Natives at Kimberley makes the following statement:—

"'Root of De Beers' attractions is well-known policy manifested in performance rather than protestation; far more flexible Compound administration; police-boy persecution not present; persistent loafers dismissed, not prosecuted; easy employment found for victims of accidents; large rewards for valuable stones."

Mortality from Diseases among Native Labourers employed on Mines and Works in the Transvaal, for the Year ended 31st December, 1913.

The following is a statement showing the mortality from disease among native labourers from various districts employed on mines and works in the proclaimed labour districts of the Transvaal (exclusive of those employed by contractors on mines and works) during 1913:—

Territory.	Average No. of Labourers employed.	Percentage of Total.	Pneumonia.		Miners' Phthisis (Silicosis).		Pulmonary Tuberculosis.		Other causes.		Total.	
			No. of Deaths.	Rate per 1,000 p.a.	No. of Deaths	Rate per 1,000 p.a.	No. of Deaths.	Rate per 1,000 p.a.	No. of Deaths.	Rate per 1,000 p.a.	No. of Deaths.	Rate per 1,000 p.a.

Position of Coal Mines.

The average number of native labourers employed in the Labour Districts of the Transvaal during the month of February, 1914, was 10,020. Of this number, 8,950 were natives from Portuguese East Africa and 1,032 natives from British South Africa.

Coal-mining is not only the worst paid, but also probably the least popular, form of mining employment among native labourers.

The coal mines affiliated to the Witwatersrand Native Labour Association receive allotments of East Coast labour up to 80 per cent. of their complements.

Recruiting of Native Labour for Mining Industry.

(1) By whom conducted and results of operations during 1913.
(2) Opposition of Department to present system on grounds that:
  (*a*) it is demoralising to natives and Europeans;
  (*b*) it is unnecessary;
  (*c*) it interferes with the outflow of voluntary labour which, in the interests of all concerned, should be fostered;
  (*d*) it establishes a monopoly for wealthier employers;
  (*e*) it is in the hands of traders and bound up with trading.
(3) System of making advances to natives on their recruitment.
(4) Undermining of the influence of Government and possibility of traders obtaining power to control labour supply and dictate terms.
(5) Duty of Government to remove all artificial aids to creation of monopoly.
(6) Provisions of recruiting laws.

Closed Compounds.

I favour the closed compound as against the open compound system wherever this arrangement may be practicable.

I am of opinion, however, that the introduction of the former system on the Witwatersrand is impracticable.

Appointment of Commissioner to Investigate Grievances of Natives employed on Mines in the Witwatersrand Area, &c.

In August of last year Mr. H. O. Buckle, Resident Magistrate, Johannesburg, was appointed a Commissioner for the following purposes:—

(1) To investigate the conditions under which natives are engaged for and employed on the mines of the Witwatersrand, and if any grievances or abuses are found to exist to make recommendations with a view to the removal thereof.
(2) To enquire into the control capable of being exercised over natives housed in compounds in the Witwatersrand area, and to make recommendations as to what measures should be taken with a view to safeguarding life and property in the event of any industrial unrest or disturbance.

Mr. Buckle has almost completed his enquiries as far as the Witwatersrand is concerned, and is at present visiting the Native Territories of the Cape Province with a view to taking further evidence, more particularly on the question of recruiting.

2480A. **(Chairman.)** You say that complaints on the part of natives as regards wages on the Witwatersrand are common, and the system of maximum average wage prevailing is especially objected to. What does the native desire—a change of system or merely an increase in pay?—The native desires an increase of pay, which to a very great extent would necessitate a change of system.

2481. A change of system in the direction of giving him more results for definite work—giving him greater scope—that is, to the more diligent?—Yes.

2482. And if the more diligent get more money, does he object to the less diligent getting less?—I do not think he thinks about that very much.

2483. But he wants his pay to be based upon piecework or results?—The native is usually recruited on the understanding that he will be paid according to his strength—that is, according to his capacity—and when he comes here he finds it is not so, particularly since the recent introduction of what is known now as the maximum average wage. The contract system, where it is in operation, is a system that appeals to natives; they work more satisfactorily, and the results are good. I believe that if the contract or piece rate system were to be extended the mining industry would have immeasurably better results from the native labour force than they have to-day. There can be no doubt that the efficiency of the native labourer has increased of recent years, but there is plenty of room yet for improvement. If the opportunity is given to them, their efficiency will further improve and the mining industry will be enabled to rely upon a much more contented and efficient force of native labour, with the probable result that they will be able to do with less labourers than they employ in normal times.

2484. Then, the great culprit is the maximum average wage?—Yes.

2485. Why was that introduced?— I understand that it was introduced with a view to doing away with the immense competition for native labour existing among the mines. It was intended to standardise the wages, more or less, so that the richer mines could not compete against the poorer ones.

2486. It was introduced with a view to the settlement of differences between competing groups?—I believe so. May I say that I feel that it is essential in the interests of all concerned that greater scope be afforded the native labourer?

2487. Do you mean the opportunity of earning higher wages or doing superior work to that which he is now employed on?—The one is consequent upon the other. I recommend that he should be given the opportunity to earn higher wages by undertaking increased responsibilities.

2488. Do you propose to break down what is called the colour bar?—I do not go as far as that. I think the necessity for the breaking down of the colour bar is still a long way off. But there are many ways in which the scope of the native labourer can be increased beneficially to all concerned.

2489. Within the terms of the actual colour bar?—Yes.

2490. Can you particularise?—I mean within what is the native's proper sphere of labour as against the certificated sphere; mining certificates being granted only to persons, I believe, of European descent. For instance, they have important servants on the mines, such as indunas and those in charge of the natives in the compounds. They have boss boys underground. They have native clerks in the various offices; and they should have hospital attendants of a class and with qualifications fitting them for that very important work. In all these classes of work the native should be allowed scope, and I feel very strongly that the rate of wages attaching to these duties should be increased. Were this to be done—and, after all, it is only common justice to the native labourer, who is worthy of his hire—the mining industry would have a much more contented labour force. I believe it is economically sound and in the interests of the mines, and, certainly, from an administrative point of view, it is essential that something of this sort should be done. We have had our industrial troubles with Europeans, and during these troubles the natives have behaved remarkably well. They deserve very well at the hands of the white man of this country, and I think that if they are only fairly treated and given the opportunity of advancement when they are deserving of advancement, and are paid accordingly, it will do a great deal to break down any reasons that they may have for giving trouble at a later date. During July of last year the native was a very interested spectator of the trouble arising from the European strike; during, and particularly towards the end of, the strike they themselves were considerably unsettled, and on the 8th July, 1913, at four mines in the Johannesburg district they struck work and demanded higher wages. We were, fortunately, able to deal with them, through having a force of military and police at our disposal, but there can be no doubt that the clock has been put on a number of years so far as the native mind is concerned. The native realises more and more to-day that he is the

true labourer of this country, and he cannot understand why the white man, who is so largely entrusted with the work of supervision, should be paid such comparatively high wages. There is a great deal to be said from the native's point of view, and I believe that if the mining industry approach the position in a generous manner, they will certainly profit in that the native will benefit and will become a much more contented and efficient labourer.

2491. What do you say about the native living in locations here and remaining longer at his work?—Do you refer to the recommendations of General Gorgas?

2492. Yes.—I strongly support General Gorgas's recommendation as to the desirability of establishing native villages wherever practicable. In certain areas—and particularly on the Central Rand—I do not think the suggestion would be practicable. If these locations were properly supervised, you would have the natives living there in considerable numbers and for lengthy periods, and you would consequently have a more permanent labour force.

2493. In your memorandum you give the average wages paid per shift to native labourers, but I do not think your comparison is quite fair, because in the case of the gold mines you have to add the food, which on the diamond mines is not supplied to the natives?—That is so; I regret that omission.

2494. What do you estimate the value of feeding a man per day to be?—I believe the actual cost to the mining industry is, approximately, 6*d*. per day. At the Premier Mine, where the natives feed themselves, the average sum estimated to be spent by each native labourer for the purchase of foodstuffs was 11*d*. per day. At De Beers it was 9½*d*. It will be understood that the natives on those mines purchase luxuries to a considerable extent. The food which is supplied to-day by the mines on the Rand is very good indeed.

2495. Outside the rations which the natives get, do they spend very much in the way of luxuries and in the way of eatables?—They buy a considerable amount of foodstuffs and other goods from the various concession stores up and down the Reef, but to what extent, of course, it is difficult to say.

2496. We have been told that the illicit liquor traffic is large and is increasing. Can you give any views about that?—That is also a difficult matter to give anything in the nature of a definite opinion about. Diverse opinions are held by those who are qualified to judge, as to whether there has been any increase in the traffic, but figures recently supplied to me by the Department of Police would appear to show that there was a decrease during 1913 in cases of Europeans charged with selling liquor to natives and in the case of drunkenness among natives.

2497. Have you the figures?—No, but I can supply them.* I am informed that there has been a substantial decrease in the number of convictions of natives for being in possession of European liquors, as distinguished from native liquors. It is also significant that during the year 1912, as compared with 1911, 44,394 gallons less of Cape brandy were imported into the Transvaal; while the information supplied by the police authorities would appear to show that the returns for 1913 may be anticipated to show a further decrease. The figures which I have quoted refer chiefly to the illicit liquor traffic in European liquors, but we have had a great deal of difficulty in dealing with the brewing of native liquors in compounds, and our experience has shown us that not only is the matter one that demands very careful attention, but that preventive measures must be taken immediately to stop the very considerable increase that there has been recently in the brewing of a liquor on the mines called "khali." This is a native liquor which is composed of golden syrup, pearl barley, a root that we have not been able to identify, and water. My experience has been that where we have had trouble with natives in the way of faction fights and disturbances we have usually had clear proof that the natives have been drinking "khali" to a considerable extent. I was furnished with some figures recently showing the increase in the importation of golden syrup into the Union of South Africa. In the year 1910 9,542,336 lbs. of golden syrup, valued at 91,000*l*. odd, were imported into the Union. During 1912 it increased to 14,505,937 pounds weight, and until recently has been increasing. It is known that an immense quantity of golden syrup has until recently been retailed to the native labourers on the mines by the storekeepers up and down the Reef. During the industrial disturbances of 1914, in order to prevent, or to take precautions against, any possible outbreak on the part of the natives, we, in conjunction with the police, arranged that the sale of golden syrup should as far as possible be restricted and its importation into the compounds should be prohibited. The decrease in the drunkenness which resulted from this measure was so marked that it was decided that more control could be, and should be, exercised by compound managers, who are responsible for the natives of the compounds, over the brewing of this liquor. This has been done by circular, and although but a short time has elapsed since the issue of these instructions, the reports that I have received from the Inspectors of Native Labour and from the police and mine officials are all to the effect that the morale and general health of the native labourers have improved and that their efficiency has noticeably increased, while, on the other hand, there has been a substantial decrease in drunkenness, assaults, and other occurrences which in the past had been quite common.

2498. And this improvement you attribute to the prohibition of the importation into the compounds of golden syrup?—Yes.

2499. Now regarding the recruiting of native labour for the mining industry, what is your general view of the system adopted and the system which might be adopted?—At the present time the recruiting of native labour for the mines is in the hands of the Witwatersrand Native Labour Association, who have a monopoly of recruiting in Portuguese East Africa, and the Native Recruiting Corporation, to whom is entrusted the major portion of the recruiting of native labour from British South Africa. There are also certain contractors, the more important of whom are Messrs. Mostert, Marwick and Morris, Mackenzie and Hadley. They supply a considerable quantum of the native labour, and are usually paid therefor on a shift basis as against so much in the way of capitation fees at the time the labour is recruited. During the year 1913, taking the Cape Province alone, there was a monthly average of 1,051 Europeans engaged in recruiting native labour. They were assisted by 827 natives employed as runners. The average number of native labourers collected monthly by these agents in the Cape Province was 5,027, or an average of 4·8 labourers monthly by each European in possession of a licence, or, including the runners, 2·7 per individual. In the remaining Provinces, where recruiting is carried on to a lesser extent, 293 labour agents were operating monthly, with approximately similar results. I am very strongly opposed to the present system of recruiting. I hold that the number of agents operating in the native districts is demoralising alike to Europeans and to the natives themselves. I may say that in making these remarks I am confining myself exclusively to recruiting in British South Africa—I do not think that recruiting on the present lines is necessary in British South Africa, more particularly since the majority of the

---

* The witness subsequently furnished the following statement:—

mines have combined under a central recruiting organisation. I am in favour of the establishment of forwarding agents, as against the large force of recruiting agents, and I believe that such a policy would result in no permanent reduction in the supply of native labour and would certainly tend towards the increase of voluntary labour, in addition to which might be anticipated a very large reduction in recruiting costs. It is possible that some temporary dislocation might result, but I hope to be able to show that the position is one that is very serious from every point of view and that it is necessary that it should be faced. At the present time, owing to the high capitation fees, the system of giving advances to natives, and the number of recruiters employed by the mining industry (almost every potential recruiter in the native territory being in the employ of the mining industry or its representatives), recruiting in British South Africa constitutes a monopoly for the large employers of labour with large capital. The smaller employers have no chance of competing, and so a fair division of the available native labour supply among the various industries of the Union is frustrated. In this connection I may state that some 80 per cent. of the recruiters in the Cape Province are traders. The results of their operations, as I have quoted, tend to show that they are in this business not so much for the purpose of securing the profit accruing from native recruiting, as for the purpose of making recruiting an aid to successful trading operations. The only other apparent reason for the employment of this large number of agents is in order to stifle competition. The chief obstacle to a voluntary system is the granting of advances. The majority of the natives now coming forward have previously worked on the mines and would proceed voluntarily to the mines if only transport facilities were available, and if the influence of the labour agent, with the additional inducement of the advance, were not present. I regard a large proportion of these natives coming forward within the Union to-day as intercepted natives much more than recruited natives. The expenses of recruiting to-day, with the advance, limited as it is to 2*l.*, are very high and can only be borne by the wealthier employers of labour, but the increase of the advance to 5*l.*, which is now being strongly advocated, will make the position much worse and strengthen the monopoly that is to-day enjoyed by the rich. To put it briefly, the main objections to the existing methods of recruiting, so far as they effect the natives themselves, are, first, the tendency to encourage extravagance by anticipating earnings and keeping them in perpetual debt to the traders; the unfavourable position of the recruited native, as compared with the voluntary labourer, the latter being invariably in a position to choose his employer and his class of work, and generally to make terms; and the further difficulty that the recruited native experiences in obtaining release from his contract, whether after illness or for any other reason, the employer being chary of granting such release unless the whole or a portion of the expenses incurred in recruiting are made good to him. This latter difficulty is one which has been brought to our notice considerably in the last few months. Then there is the tendency to encourage fraud by natives in securing advances from one or more labour agents without any intention of proceeding to work. On the other hand, the voluntary system of labour, combined, as I recommend, with a system of deferred pay or regular remittances, while removing these objections, would in addition reap the following advantages both to the natives and the traders who are so largely interested in this business. It would enable better provision to be made for the families of absentees, who are at the best but ill provided for by an advance of 2*l.* (the labourer generally regarding the handing over of this amount as a sufficient discharge of his obligations towards them), and are dependent on the credit allowed by the trader, the potential labour value of the absentee or his relatives being regarded as security for the granting of such credit. It would bring about an increased diffusion of money within the Native Territories and the reconstruction of trade on a cash instead of a credit basis as at the present time, while it would largely do away with the tendency on the part of the natives to break away from the parental control by limiting their spending powers at the place of employment where, in Johannesburg particularly, they are peculiarly liable to temptations. I recommend the total abolition of the advance system and the substitution therefor of a voluntary system of deferred pay. It was reported —and we regard this as a particularly serious feature of the whole position—that it is all tending towards the belittling of the influence of the Government. There is very little doubt that the present methods also are enabling traders to get such a grip of the native population, particularly in the native areas of the Cape Province, that we are actually threatened with a combination of traders to control the output of native labour. It is difficult to vouch for the truth of these reports, but it is quite conceivable, I submit, that such a position might easily arise, the position being that the mining industry have, as I say, practically a monopoly of recruiting and have placed all their eggs in one basket. It is quite clear that the Government cannot interfere with legitimate competition in attracting native labour; the influences of better pay, better treatment, and better conditions of work generally will always operate. But I feel strongly that the Government should not associate itself with any artificial aids which have the effect of throwing the labour into the hands of the wealthy employers. Lastly, from the point of view of native administration, I think the position is utterly bad. It may be that the mining industry, if the Government forces this position, will have to face a temporary dislocation, but in the interests of native administration I hold that the Government will be wrongly advised if they do otherwise than insist on the position being faced.

2500. You mean the necessity of abandoning the recruiting system?—Yes, the necessity of abandoning the recruiting system as it exists to-day.

2501. What does the native cost on an average to the Company when he gets here—the recruited native? —The Native Labour Association and the Recruiting Corporation are in a much better position to give information on that point.

2502. You have no figure of the total cost of recruiting operations?—I understand that it approximates to 6*d.* per shift.

2503. Which is, therefore, 25 per cent. of the remuneration of the native?—Yes.

2504. Now you say in your statement that you favour the closed compound as against the open compound,—but you regard the introduction of the closed compound here as impracticable?—Yes.

2505. Can you give the reasons for that view?—In central Johannesburg, particularly, I think that the closed compound would be impracticable, geographically speaking, as it would also be in other parts where the shafts are at such considerable distances from the compounds. The fencing in and guarding of the compounds would be an enormous undertaking. If only the compounds were fenced in and the natives were allowed to go out to work without a guard or escort the object in view would largely be defeated. Feeling, as I do, that any partial measures would be ineffective, I do not recommend the introduction here of the closed compound.

2506. Does the native prefer it or not?—It is difficult to say. Certainly, where they have had experience of the closed compounds, such as at De Beers and the Premier Mine, the natives apparently like it. In my statement I quote figures showing that at De Beers, whereas during the year 1913 they only recruited 4,449 natives, 35,421 natives went there for employment voluntarily. I also know that in Basutoland employment at De Beers is so popular as to induce the natives actually to pay the representatives of the De Beers Company certain sums of money to enable them to be sent there. At the Premier Mine 25·9 per cent. of the natives engaged by that Company during the year 1913 were voluntary natives. They have recently re-organised their recruiting organisation and now employ only one recruiter. In other parts they have salaried employees, whose duty it is to afford facilities for natives to proceed to the mine work. It is such a system that I recommend as against the present recruiting system.

2507. **(Mr. Lorimer.)** You say that coal-mining is not only the worst paid, but also probably the least popular, form of mining among native labourers. How does the coal mine get any employees at all if the gold mines have not got enough for their requirements?—By arrangement with the Witwatersrand Native Labour Association the collieries receive allotments of Portuguese East African labour up to 80 per cent. of their complements.

2508. Do the men who work in the collieries mostly come from the East Coast?—85·72 per cent. of the natives at present employed in coal mines are from Portuguese East Africa.

2509. Are these men, when they leave home, told that they are going to this poorly-paid work?—No.

2510. Are they told what wages they will get?—The contract with the Portuguese native provides for a minimum wage of 1*s.* 6*d.* per shift.

2511. Then the coal owners must have a certain percentage of other labour than East Coast, if the latter represents only 85 per cent. That leaves over 14 per cent. to be obtained from elsewhere?—Yes. They come from British South Africa.

2512. What are these men told in regard to their wages?—They are recruited specifically for the coal mines at the specified rates of pay.

2513. And the rate is fixed: they know that before they leave home?—Yes.

2514. You said at the beginning of your evidence that the native is beginning to think that he is the real producer, and, not unnaturally, wants more wages?—Yes.

2515. Well, roughly speaking, I think 1*d.* per day increase would be equal to 1,000*l.* odd in higher wages?—Yes.

2516. And 6*d.* a day would therefore amount to more than one and three-quarter millions a year?—Yes.

2517. Now that, of course, would be a pretty considerable inroad on the profits of the Rand mines. Are you of opinion that that could be got back by greater efficiency and by greater use of rock-drills, and by general improvement of organisation?—I would prefer to confine my evidence to the conserving of native labour. I am not in a position to give evidence as to how much labour you could save by such devices as rock-drills and so on. I believe, however, that the efficiency of the native can be substantially increased if an incentive be provided, that is, an increased wage. If that be done a considerable number of natives might be dispensed with.

2518. **(Mr. Tatlow.)** You are not at all in favour of the recruiting system?—No.

2519. But do you think it will ever be possible to do without it?—How do you interpret recruiting system? What do you mean by recruiting?

2520. I mean sending out men to engage labour by offering certain inducements.—I am perfectly confident that you can do away with what I call touting for labour, provided that you provide facilities, through paid employees of the mining industry at the various centres where these labourers come from, to enable the natives to come here to work.

2521. And give no other inducements?—No.

2522. And make fair representations to them as to what they are to earn?—Yes. You will see from the figures that some 75 per cent. of the labourers that are coming forward are natives who have been here before. The only other employers in the Cape Province employing a considerable amount of native labour are the railways and harbours, and they will always have their quantum of labour. But even after giving them their requirements there still is sufficient labour available for the requirements of the mining industry without the necessity of recruiters scrambling and tumbling over each other to collect natives at the rate of two per month.

2523. What is that system of voluntary deferred pay to which you referred as being a great advantage if it was carried out?—The employers will arrange that it be provided in the contract that so much of the wages earned shall be payable at the place of employment and the balance on the native's return home.

2524. Not paying until he returns home?—No.

2525. I see in your statement in regard to the Premier Mine that "the average number of natives employed in 1913 was 14,548, and the total remittances made by us on behalf of the native labourers that year was 15,617*l.*" That seems a very low amount to remit?—Yes. The natives' moneys go home in various ways. They take it home, and they are very secretive as to what they have in their purses. They send it home by friends returning, and also send it through Departmental Remittance Agencies. The natives employed on other mines sometimes remit their earnings through their employer, others through the agency of the Native Affairs Department, but not to any great extent, while a considerable sum is remitted annually through the Post Office.

2526. Then this does not really represent what is sent home?—It certainly does not represent more than a fraction of what reaches home.

2527. It does not convey any idea to one's mind as to what they do remit?—That is so.

2528–9. But have you any knowledge at all of what the average is which they remit home?—It is estimated that the native from British South Africa, having completed nine tickets of thirty shifts each, takes home something between 10*l.* and 15*l.* But opinions differ considerably on this question.

2530. It can only be a wide sort of estimate, I suppose?—Yes.

2531. You spoke of more transport facilities being necessary. What was in your mind in regard to that?—The native, as a rule, when he wants to come out to work is not in a position to pay his railway fare. With the extension of the railways throughout the native territories, no native kraal is at too great a distance from the railway for the native to "foot it" to an entraining centre, and, if at these places there were representatives of the mining industry ready to receive and house them until their contracts were entered into, put them on to the train, pay their railway fares and give them food for the journey, I hold that that is all that is necessary.

2532. It was not that you thought that anything was wanting on the part of the Railway Department in not providing proper fares?—No.

2533. **(Mr. Garnett.)** With regard to this illicit brewing in the compounds, is that a matter of compound oversight or supervision?—Yes, it is; it is within the compound manager's supervision.

2534. We had it in evidence that many people favour very much the great restriction of the sale of liquor—even to the extent of local option and even total prohibition—have you anything to say from that point of view?—At present I do not care to go further than to recommend the issue of kaffir beer to the natives in the compounds. It is a well-known native drink, particularly in the Union, and it is not only a beverage, it is a food. It is also a recognised anti-scorbutic. In Durban the municipality has established native restaurants where kaffir beer is sold The result has been that drunkenness among natives in Durban has largely decreased. The municipality there has caused to be compiled very complete returns covering the period before and since the adoption of this policy, and these returns show a most noticeable reduction in drunkenness and petty crime resulting from drunkenness.

2535. Apart from the supply of that liquor then, you favour very stringent restrictions of any other liquors?—I am not in favour of the sale of any other liquor to natives.

2536. Would you go so far as to favour local option in the matter?—No.

2537. Then while you are strongly against the recruiting agent, you are strongly in favour of the forwarding agency system. May I ask if you would define the character of the agency that you would set up; I suppose they would be for the purpose of assisting voluntary natives to come to the mines?—As a rule, agents probably would be stationed at or near the entraining centres. Their offices would be made known to the natives by a system of runners, no doubt, and the natives would know when they were ready to go out to work that they had only to proceed to the nearest entraining centre and apply at the office for assistance to enable them to come here for work. I refer to these as forwarding agents as distinct from the touts and recruiters of to-day, who collect their natives through runners and also through such bait as, for instance, an advance of cash or food.

2538. Then with the knowledge that is spread by the natives who return home from the mines as to the facilities for entraining and so forth, you think the recruiting agent might be very largely abolished?—I do. That is a very important point. The best recruiter that the mining industry can have is the returning native. If he can go home and spread good reports as to his treatment generally, it will benefit the mining industry to an extent far beyond that obtained by the employment of a number of touts. I believe that if the leaders of the mining industry applied themselves to the betterment of conditions here, particularly with regard to the wages of natives and towards affording more scope to the native labourer to advance, they would largely get over the difficulty of getting labour.

2539. You said that smaller employers had no chance of getting natives distributed among them, and the various industries of the country were suffering very much from this. Do you mean that the general body of employers outside the great organised industry of mining suffer?—Employers of labour all through South Africa feel the pinch in regard to the supply of native labour. The various industries of Natal are suffering, although I hold that it has been largely Natal's own fault in the past. Natal, in the past, has relied too completely on indentured Indian labour, and has not made any attempt to provide even a nucleus of native labour in its own territory from its own resources. In some cases the people in Natal have actually encouraged the Rand to invade them and establish recruiting agencies in various parts. The result has been that to-day the people of Natal are crying out for labour, but they find the Rand firmly established and getting labour when their industries are starving. I have frequently been approached here by contractors on irrigation works to assist them in procuring native labour. They find it impossible to collect it, and the farmers are in similar straits. I frankly admit that they will always find a difficulty in competing with a strong industry like the mining industry, and unless they can put up their wages to approximately those paid by the mining industry here, they will have a very poor chance of competing. But I strongly oppose any artificial aids necessitating capital. It comes to this. If this advance is put up to 5*l.*, an employer requiring 500 natives will require to have capital to the extent of 2,500*l.* at his back, in addition to having to pay the present high capitation fees.

2540. Is your general conclusion then that this present system is at once exceedingly expensive to the mining industry, and results in a general barring of labour for every other industry in the country?—That is the effect.

2541. **(Sir Alfred Bateman.)** You have put in a very interesting table of statistics about the mortality from disease last year. Now, in the rate per thousand, the figures differ immensely according to the places from whence the natives come?—Yes.

2542. Are the figures large enough for you to have confidence in them? From Nyassaland and Zambesia the figures are very high, in the former case being 51½ per thousand and in the latter 46 per thousand. In the Union it goes down to twelve and thirteen. Do you think that fairly represents the usual rates?—Yes, the death-rate among natives from tropical areas has always been considerably higher than that among natives from places within the Union.

2543. But, altogether, it works out to something like 20 or 21?—20·6 per thousand.

2544. How do you think that compares with the normal mortality among natives?—Considering, as General Gorgas pointed out, that you are dealing with adult and selected natives, it is high.

2545. If we had a selected population at home at those ages it would be something like six or seven per thousand?—Yes.

2546. I do not think you have the death-rates for natives in their own homes?—I do not think any reliable statistics on the point are available.

2547. Have you formed any idea as to whether there is much difference?—I could not say. This death-rate of 20·6 is the lowest we have had.

2548. But this, as General Gorgas said, is for picked lives?—Yes.

2549. Now, in regard to saving recruiting fees, which you said amounted to something like 6*d.* per shift?—Yes.

2550. Would the mines be able to give that to the native? Would the natives get anything out of it if the recruiting were abolished?—If the mines were to reduce their recruiting expenses substantially they might apply a portion of that saving towards the increase of the native wages. That is the way the native approaches the position.

2551. Does the native know that?—Yes. I do not say that the average native does, but the more educated native is aware of it. In fact, they have made representations to the Department on these lines.

2552. Does the greater number now belong to trades unions?—I do not think so. They have an organization on the Rand which savours to a certain extent of trades unionism, but it is not strong.

2553. But you do not agree with the evidence laid before us last week that it may be described as semi-slavery—the employment of the native under the present conditions?—Certainly not. There is a good deal that still can be put right, generally speaking, but there is no doubt that the conditions of recruitment and employment of the native on the Rand have improved immensely.

2554. Nor would you agree, I suppose, with the policy of sending them back to their own countries and using white labour only?—Certainly not.

2555. One or two questions about the drink called khali: what is the alcoholic strength?—Curiously enough the alcoholic strength is comparatively low. After about 24 hours the alcoholic strength is about 1·7 per cent.

2556. Of absolute alcohol?—Yes.

2557. About three of what we call standard. You know the difference between absolute alcohol and what we call Sykes's. The proportion is about half absolute alcohol—that is what is called proof?—Yes. After about three to five days it increases in alcoholic strength to about five or six. That percentage is less than that of beer.

2558. Yes, Bass's beer is more than that, I think?—But we believe that this root has some narcotic influence on the native in addition to the intoxicating effect of the liquor.

2559. There is something mysterious about it?—Yes.

2560. Have you ever tried to get at the root of the root?—Yes, it is being investigated at present by the Government Analyst.

2561. It might be useful to send some of it to the Imperial Institute in London: they have a staff of qualified chemists who are always at work on these matters?—I will arrange for this to be done.

2562. What is the strength of kaffir beer?—As a rule about two per cent.

2563. Both of these drinks are brewed? It is fermentation and not distillation?—Yes.

2564. Is there distillation going on?—Practically none.

2565. I should have thought they would have found out about the tea kettle?—It is not unknown in Portuguese territory. The natives frequently distil there, but I have not heard of it here.

2566. The Portuguese native is supposed to get wine?—Yes.

2567. Do you think he is worse for it?—He is certainly no better.

2568. But is he worse?—I cannot say.

2569. But directly he comes here he has to do without it?—Yes.

2570. And he does not seem to suffer?—Their death-rate is higher than that of others, but I am not in a position to say that the physique of the Portuguese native is in any way impaired by drink.

2571. I understand you are rather against local option?—I would not go so far. The experience of the past two or three months has shown us what can be done with proper compound control towards preventing the importation into, and brewing of liquors in, the compounds.

2572. You do not think there should be such a heroic remedy as to stop it absolutely?—I do not think it is necessary.

2573. **(Mr. Sinclair.)** What is the reason that you suggest for business companies spending such large sums on recruiting natives under existing conditions unnecessarily?—I do not think that the leaders of the

mining industry have ever sufficiently investigated the matter. I feel that they have been badly advised from the outset.

2574. Surely there must be another side to the question besides that you have put. One can hardly conceive of business men spending such large amounts of money if it was unnecessary?—I have a return here which I think will throw some light on it.

2575. It would seem to be such a serious reflection on the business capacity of any company that adopted it, that some close explanation would appear to be called for?—In 1904, when Chinese were employed on the mines, 5,398 natives from the Cape Province were employed. At that time, the only recruiters in the Cape Province for the mining industry were the Witwatersrand Native Labour Association, which is really an off-shoot of the Chamber of Mines. When a decision was arrived at by the Government in 1907, I think it was, to repatriate the Chinese, it then became necessary for the mining industry to replace the Chinese from other parts. The Cape, in fact the Union as a whole, had not been exploited properly. They then went not only to the native territories of the Union, but also to tropical areas, and it can safely be said that the Chinese have been replaced by the natives that have come to the industry since from within South Africa. Whereas only some 5,000 were employed in 1904, less than nine years afterwards we had 79,000 employed from the Cape. The percentage of the total average employed in 1904 was: Cape natives 7·2, Portuguese East Africa natives, 69·2. In 1913 the Cape percentage had increased to 32·3 and all Portuguese East Africa, including tropical areas, 39·5. In getting out this labour there was very considerable competition. All the groups had their various runners and agents throughout these native territories. Individual mines in some cases had their own representatives, and the competition was enormous, and it is largely as a result of this competition that the very expensive system that exists to-day has come about. In October, 1912, the majority of the mines amalgamated under the Native Recruiting Corporation, and I understand that to some little extent they have been able to reduce their expenses, but very slightly. I think this is attributable to the fact that they have put all their eggs in one basket and have become dependent on the trader for their recruiting to such an extent that they now find it very difficult to get out of his hands—in fact, in my opinion, they are in his hands to-day. It is admitted by those who control the recruiting operations of the mining industry in the Cape that they have no control over their agents and that they dare not attempt to establish too openly a voluntary system, which is contrary to the interests of the trader-recruiters. They have practically placed a monopoly in the hands of these people.

2576. But a business man does not let the middleman run away with him like that?—That is the position to-day. The middleman has the grip of the situation.

2577. The maximum wage that you spoke of in the early part of your evidence was designed to standardize wages so that the richer mine would not have an advantage over the poorer. Now, although that may have tended to do justice as between the rich and the poor mine, it was justice, if it can be called justice, at the expense of the worker?—Yes.

2578. It lessens competition for his labour?—Yes.

2579. With regard to the decreased imports of illicit liquors that you referred to—brandy, I think—do you think that has been brought about or contributed to by the increased brewing that has gone on in the compounds?—It is difficult to say. I am told that at present the practical abolition of brewing in the compounds has resulted in an increase in the illicit traffic outside. I have attempted to get corroboration of this statement, but I have not been able to do so.

2580. Has the question of the illicit sales of liquor to either whites or natives come officially before you?—Yes.

2581. And is it your opinion that it obtains to any serious extent?—Yes.

2582. You are satisfied?—Yes.

2583. Is it your opinion that in the future the cost of labour—I am speaking more particularly of native labour—is bound to go up?—Do you mean the cost of procuring?

2584. The cost of the labour to the mine.—I think there will be a decrease in the cost of procuring native labour. There need be no substantial increase in the compound maintenance costs, but I believe that the wage will go up.

2585. The daily wage is what I want to get at?—Yes.

2586. You think it is bound to go up?—Yes.

2587. **(Mr. Garnett.)** As regards the death-rate, taking the natives from Mozambique, I see that 20·61 of the total proportion of 31·73 are due to pneumonia, and from Nyassaland 30·98 out of 51·46, and from Zambesia 24·92 out of 46·15 are due to the same cause. I suppose the great proportion of cases of this disease is due to the translation of the natives from their own country to this climate, and that they are always more predisposed to that disease?—Yes.

2588. **(Sir Alfred Bateman.)** You do not think it is due to losing the wine they are accustomed to?—No. I do not think so.

Mr. G. Nathan, representing the General Mining and Finance Corporation, called and examined.

2589. **(Chairman.)** You have sent in a memorandum to the Commission, for which we are obliged.

The Memorandum was as follows:—

I beg to submit hereunder my ideas with regard to the present system of working the mines of the Witwatersrand, and the best way in which a lasting improvement could be effected, *i.e.*, by a general amalgamation.

Since the beginning of the exploration of the gold-bearing strata of the Witwatersrand, it has been the custom to work smaller or larger claim areas through individual companies, which, though separate units, were controlled by the mining houses who formed these units into groups of administration. In the course of time the disadvantage of these methods to everybody concerned has manifested itself in so many directions that it would appear desirable to overcome so inefficient a system. The first attempts in this direction were made by amalgamating two or three separate companies, and in recent years by the fusion of larger numbers. The only method, however, of bringing about a basis of operation satisfactory to all concerned—shareholders, workmen, and country—viz., a general amalgamation of all the existing companies, has not been adopted, for reasons which, in my opinion, are either based on a lack of understanding of the position which would be created by such fusion, or which are absolutely outside the question of the economic working of these mines, *i.e.*, political party reasons. I do not propose to go further into details as to why the idea of a general amalgamation has not been carried into effect, but with your permission I will attempt to show the disadvantages of the present system, and the advantages which would obtain under the new system after amalgamation. I think for this purpose it will be best to begin with the administration of the mines. This has to be divided into two sections, that on the individual mines and that in the head offices. On each of the mines to-day there is a mine office, with its own staff, and although the individual concerns work to a certain degree under the direction of the head offices of the respective controlling groups, they do not operate on a general basis, but each tries to get small advantages over the other, which I have no hesitation in saying leads to unnecessary expenditure and inefficiency. It must be borne in mind that under the direct control of these mine offices comes the administration of native compounds, and what I have just stated with regard to unnecessary expenditure and inefficiency certainly applies to these compounds also, the amount involved being very great when the large number of native employees is taken into consideration.

Now I come to the Head Offices. Each group has its head office in Johannesburg, and I think most or all of them have also offices in London and Paris, and some in Berlin as well. In the Johannesburg offices are a large number of departments, each dealing

with separate details of the administration of the mines, and, naturally, each of these offices requires its own staff, with all the attendant expenditure. Moreover, the very heads of these offices, unfortunately, look at the mining industry not as a whole, but almost invariably from the point of view of the special interests of the mines under their own particular control, the upshot being that no common policy for the working of the mines is pursued, and that in order to gain minor or temporary advantages the industry as a whole, and with it, of course, everybody concerned therein, is made to suffer largely. Apart from the Chamber of Mines, the Executive of which consists of representatives of the various groups, and which is supposed to deal with the administration of the whole of the industry, there also exists the Groups Committee, whose *raison d'être* I, personally, have never been able to make out, but which, I am always told, is of very great advantage in connection with the control of the mining industry—a view which I am sorry to say I cannot accept; and there are, further, a Consulting Engineers' Committee, a Mine Managers' Association, the Witwatersrand Native Labour Association, and last, but not least, the Native Recruiting Corporation. All these different bodies, instead of working harmoniously together, somehow or other, through jealousy or I know not what reasons, seem to manage to pull against each other, and the result, naturally, cannot be a good one. Now, if a general amalgamation were brought about, all these separate organisations would be thrown together, they would be very largely reduced in personnel, and they would have at their head one chairman, with the consequence that either unanimity would be brought about or the minority would be ruled by the majority, and a common, far-sighted policy would be inaugurated for the whole of the Witwatersrand, the beneficial effects of which on the working of the mines nobody can reasonably doubt. So far as the Witwatersrand Native Labour Association and the Native Recruiting Corporation are concerned, I shall refer to these later.

I now propose to deal with the disadvantages the present system involves for the workmen. To-day there is competition everywhere for white labour as well as black, and although, through the existence of the Witwatersrand Native Labour Association and the Native Recruiting Corporation, the competition for native labour has been somewhat limited, it goes on, nevertheless, in certain directions. The consequence of this is not to the benefit of the workmen, and does not conduce to the earning of steady wages, but, rather especially as regards the white men—induces them to roam about all over the Rand in the hope of extracting a big cheque on the "other mine," and after having tried, and very often failed, to achieve this object on that "other mine," they again move on to another property. What is the consequence of this? It seems obvious that it must lead to inefficiency, because apart from the fact that no sooner has a workman become reasonably acquainted with his working place in one mine than he leaves and has to start anew in unfamiliar surroundings, he also loses the interest which he would naturally feel for a particular mine if his employment in that mine were of long duration; and although I believe we have very many honest workmen on these fields who have no intention of working below their capacity, it is only human that under the circumstances they should involuntarily slide into slackness. This slackness, of course, reacts on them as far as their pay is concerned, but it has also other serious consequences. It is often the cause of accidents, attended, in many cases, by loss of life, and it also results in neglect of the precautions for maintaining proper health conditions—underground as well as on the surface. Then, again, this competition for labour is carried on by mines which are struggling for their very existence. The latter absorb large quantities of labour which could, to the greater advantage of the labourers themselves and of the industry in general, be employed in other and richer sections, until, as efficiency increased, these poor mines could be worked at a larger profit, with benefit to all. I am also convinced that the competition for labour, so far as the natives are concerned, has conduced to the continuation of the system of recruiting so distasteful to the native himself, and certainly not less distasteful to the employer. The recruiters have taken advantage of the position, and, in my opinion, have succeeded on various occasions in making the employers believe in the necessity for continuing the evil, under the threat that the natives will not come to work unless they receive, before leaving their kraals, an advance to supply their families with necessaries of life. Now, I am strongly of the opinion that this custom of advancing a labourer money before he has even started work (and I make bold to say that very often he will not commence work as soon as he would have done had he not received an advance) is economically most unsound, and must lead to discontent amongst those to whom the advances are made. I maintain that if a general amalgamation were brought about and the industry were in a position, as a whole, to make the Witwatersrand more attractive to natives, the latter would come voluntarily to work, and the monstrous expenditure in connection with this loathful recruiting system would be saved. I am quite prepared to admit that years ago it was necessary to recruit natives for work on these fields, because they were not then acquainted with the mines, but since then they have travelled to and fro in such large numbers that no other advertisement is needed than the native going back to his kraal and expressing satisfaction with his stay here.

The next point I propose to discuss is the working of the mines. To-day, labour is scattered all over the fields, and except at a few of the larger properties it is impossible to concentrate work in such a manner as to obtain the best results. After a general combination this could be easily effected, and, without fear of contradiction, I state that a large reduction in working costs could be brought about without reducing the existing scale of wages. It naturally follows that when concentrating work in the manner I have in mind, a much greater proportion of mechanical appliances would be used, and, obviously, if the same quantity of rock were then broken, it could be done with a lesser number of employees; but it must not be forgotten that, in consequence of the lower working costs then obtaining, ore which cannot be profitably worked to-day will be brought within the limit of payability, and I have no doubt that the larger scale of operations would much more than make up for the loss of employment resulting from improved efficiency.

There is another very serious aspect to the working of the mines individually. To-day there are some properties which, undoubtedly, have so many working faces at their disposal that they could easily crush larger tonnages provided they had a sufficient labour force, but, this not being available, some of the faces have perforce to remain unworked, whereas in other mines the number of faces available is inadequate, and double shifts are resorted to in order to make up for the deficiency. I need not say that, from a health point of view, the double-shift system is undesirable, and I think I am right in stating that from the financial aspect also it is unsound. Were an amalgamation brought about, this state of affairs would at once cease to exist, and single shift could be introduced all over the Rand, with its undoubted advantages, especially to the working men.

Speaking of the financial side, there is, in my opinion, a certain amount of so-called capital expenditure incurred which could be avoided if the existing workings, plant, and machinery could be made the best use of for the whole of the mines, instead of, as under prevailing conditions, serving individual mines only.

I have endeavoured to show in the foregoing the disadvantages of the present arrangement *vis-a-vis* the advantages of a general amalgamation, but unfortunately, owing to lack of time, I have not been able to go into details as fully as I would have liked. If, however, you desire me to supply such details at a later date, I shall have great pleasure in preparing them.

In the meantime, I will shortly recapitulate my arguments in favour of a general amalgamation, and will divide the benefits to be derived therefrom into three classes:—

1. Those accruing to the working man.
2. Those accruing to shareholders.
3. Those accruing to the community of the Witwatersrand and to South Africa as a whole.

1. Although on the face of my proposals it might appear that the number of white men employed would be reduced, I maintain that the reverse would actually be the case. Wherever a reduction would be brought about through better efficiency, an increase greater than that necessary to equalise this would take place in consequence of lower grade ore coming under attack, so that, in my opinion, this fear can be dismissed. On the other hand, a combination of the mines would, undoubtedly, have the effect of giving the workmen steadier employment, more regular wages, and, as larger amounts of money for welfare work would be available, better health and living conditions, which could not fail to lead to the contentment which is so sorely lacking here.

2. The shareholder would see eliminated the more or less speculative element attaching to his holdings to-day, inasmuch as the chances of the grade in the particular mine in which he is at present interested falling off, would be minimised or almost totally removed by the fact that, as experience has shown, reductions of value at one point are to a large extent compensated for by increases at another; consequently his investment would be in a concern of much greater stability, while at the same time embracing all the possibilities of this great mining field. He would also benefit by the increase of profits resulting from concentration and improved efficiency, and although, as I will state later, I would not propose to distribute the whole of the profits to shareholders I think I am not too optimistic if I predict that larger distributions would be made to them than will be possible in the future under a continuance of the present arrangements.

3. I have often heard it argued that the mercantile community would greatly suffer by a general amalgamation, inasmuch as the combined concern would then be inclined to deal direct with producers, instead of, as we are doing now, through local houses or agents. Personally, I have not the slightest fears for the mercantile community in this connection. I think it is in the interests of the administrators of the mining industry to deal with local merchants, as the economy effected by dealing direct with the manufacturers cannot outweigh the advantages of having a responsible person on the spot to negotiate with in cases where deliveries are not as expected. As a matter of fact, I think that after the amalgamation a wave of progress would come over the land, and the merchants necessarily would benefit by the attendant expansion. But it is not only the merchant we have to consider; it is South Africa as a whole; and in order that the Union should benefit, apart from the increases which would take place in Profits Tax, &c., I propose that after shareholders shall have received in dividends an annual amount of, say, 7 per cent. on the capital invested by them, say 25 per cent. of the remaining profits should be retained by the amalgamated concern for reinvestment in the Union of South Africa; that is to say, the money should be used for purposes such as the opening up of new mines, the building of railroads, or the fostering of farming and other industries. In this manner an activity could be secured which otherwise could not easily be brought about, which would lead not only to larger revenue to the country's exchequer, but also to the employment of large numbers of additional workmen.

I hope I have succeeded in the foregoing remarks in showing that there would be no reason to fear (as has been suggested to me) that the general amalgamation of the mines of the Witwatersrand would bring ruin to many people, and that I have proved that such amalgamation would benefit not only shareholders but also the workmen and the community of the country as a whole, and that progress, which is now hampered by causes already explained by me, would then ensue to an unexpected degree.

2589A. **(Chairman.)** I gather from that that you are strongly in favour of amalgamation of the mining industry, and you think it is quite practicable?—Yes.

2590. You consider that the mines are not working at present to the best advantage?—That is my opinion.

2591. And you think that amalgamation is a system under which all would benefit?—I think so, under a general amalgamation.

2592. What are the greatest difficulties to be overcome?—I think the principal objection to the present system is the enormous waste of labour which might be obviated. Mr. Schumacher is, I think, in favour of amalgamation in theory, but in practice he is against it. But in regard to the Crown Mines, which he has referred to, they are now crushing 60,000 more tons with the same labour than they were crushing in 1909. I think that is conclusive proof of the benefit in amalgamation as regards working of the mines. He has also referred to the New Modderfontein Mines—well, they used to crush, about a year ago, about 50,000 tons with approximately double the number of labourers they have to-day. I think that proves that the labour is most extravagantly used, and that there is enormous wastage. I believe that if there was amalgamation a much greater tonnage could be crushed with the same labour force, or that the same tonnage could be crushed with a less number of natives, and consequently much more development would take place in this country. In regard to the shortage of labour which we constantly hear about, I think that in reality it does not exist.

2593. Your view is that the shortage is created by the industry?—I think so. I am most strongly of that opinion.

2594. Now what have you to say as to the effect of amalgamation in regard to the interests of the white worker?—The white worker will be benefited because he will not move about as he does to-day, and more regular work can be done with greater efficiency. He will be more comfortable and contented because he will know that he can go on working indefinitely. He will not have the inducement to keep going from one mine to another to earn the big cheque. Consequently he will take more interest in his work, and his wages will be more steady; also his health conditions will be better, because owing to the state of affairs hitherto obtaining he must become callous.

2595. Why do you say he must become callous under the present system?—Because if a man works a certain time at one mine and then goes to another with new surroundings, I do not think he pays the same attention to the preventives that exist that he otherwise would.

2596. I think the average of the white worker here to-day is something like 1*l.* a shift?—Yes.

2597. Do you consider that the advantages obtainable under your proposed scheme would be such that a higher daily wage would be paid to the white worker out of the profits?—I do not know that that would be necessary, but certainly I am not in favour of reducing wages.

2598. As to the present management of the industry as a whole, that management is in the hands of various groups?—Yes.

2599. To what extent can it be said that their direction is to the general benefit or particular benefit?—I cannot see that it is to the general benefit at all.

2600. That is to say, each group looks after itself?—Yes. They come together to discuss matters, and make joint arrangements, but these are very rarely carried out. I think the whole arrangement to-day is very cumbersome and unnecessary. You have head offices here, and head offices in London, and Paris, and Berlin. You have the Chamber of Mines and the Witwatersrand Native Labour Association, and the Native Recruiting Corporation, and you have the Consulting Engineers Committee and the Managers Association, and they are all somehow or other pulling against each other. I do not know how it strikes the Commission, but it appears to me that it is impossible to manage an industry efficiently under these circumstances.

2601. You think that these six bodies——?—There are more.

2602. Well, you think that these six or more bodies are not scientifically necessary?—They are not. As a matter of fact, I think they are absolutely unnecessary, and that one body could manage the whole concern.

2603. What is your view regarding the contract system?—I do not think the results are satisfactory.

2604. Do you think it leads to instability of white labour, and also to increased risk of accident in the mines?—Yes, it does, because the miner goes from mine to mine at present to earn the big cheque.

2605. Now, as regards the native labourer: In what direction do you look for further efficiency and his being given greater scope with a view to getting higher remuneration for better work?—I believe there is scope in that direction.

2606. You consider that the maximum average wage, with the restrictions imposed on a man earning more than a given amount per day, are harmful to the development of the industry?—Yes, and harmful to the native's development as well.

2607. You think that it also diminishes the attraction of these fields for the native in the distant territories?—I think so.

2608. Let us assume that it was possible to give the native the opportunity of earning 3*s.* or 3*s.* 6*d.* instead of keeping him at 2*s.* 2*d.*, do you think that that would conduce very powerfully to attract natives here and to keep them here longer?—I do not think we require a larger force. I think it is large enough if we only made proper use of it.

2609. That is to say, at present a large number of men work inefficiently for a small individual wage?—Yes, I think most of them are not working to the full extent of their capacity.

2610. Now any concentration of direction such as you have indicated would probably lead to a far larger use of machinery?—Yes.

2611. Is it a fact or not that this principle holds good that the more machinery there is the more white skilled labour is required?—I think the white man will always be superior to the native in working with machinery, and as you employ more machinery, naturally you can expand, and through that expansion you will employ more white men than to-day.

2612. That is to say, the more highly developed the machinery of extraction is the greater the proportion of skilled white labour that you require?—Exactly.

2613. You speak of the question of single shifts and double shifts. Is it universally admitted that the single shift system is more conducive to the health of the worker?—I think so. It must be, because you clear your mine much better.

2614. I think you also say, which is not so generally admitted, that it is more economical?—Yes.

2615. Why?—Because the man on night shift never works as well as the man on day shift.

2616. And you hold the view that with more concentrated direction the whole of the fields could be worked with a single shift?—Yes, most decidedly.

2617. Can you develop that?—I think that even to-day there is a large amount of development available, which, if the whole of the companies would only amalgamate, could be made use of, whereas individual companies cannot make full use of it, because they have not the labour force necessary, or the proper surface plant.

2618. You are willing to give further details in development of your views?—Yes.

2619. We shall be glad to have them,* and we are greatly indebted to you for the work you have already done. In regard to the mercantile community here, whose interests have to be considered, what do you say the effect would be?—I should say they would benefit because there would be expansion. The mercantile community are afraid that if there is general amalgamation the new company may import direct. But that will never take place, because the small financial advantage is more than outweighed by the fact that to-day you have the agent or the representative of the home house on the spot with whom you can negotiate in case of delay or dissatisfaction. I would not be in favour of abolishing the agency.

2620. That applies to the larger houses; what is the proportion of the stores now bought by the industry which is not bought locally?—I do not think anything is bought which is not bought locally.

2621. The company has to buy everything on the spot?—Yes. Of course, it is imported, but it is bought locally.

2622. Through a commission agent or representative?—Yes, and it will continue.

2623. Presumably if your plan were adopted?—Quite so.

2624. Now, in regard to the smaller trading community, how would they be affected?—I do not see why they should suffer adversely. I cannot see any reason why they should lose. On the other hand, I think they would benefit by the general expansion.

2625. That is to say—your scheme would produce economy, and the resulting economy would mean that large areas would be worked which are now unworkable?—Yes, and it also leads to better organization, and through that, areas which would otherwise have to wait can be worked at once.

2626. I suppose you also say that improved economy facilitates the supply of capital, without which the development must necessarily be slow?—Yes.

2627. And in that direction also rapid expansion is rendered more feasible?—Yes. But I also propose not to distribute all the profits to shareholders.

2628. What do you propose in that direction?—Of course it is very difficult to state definite figures in this connection, but what I had in my mind was that the shareholders should get, say, 7 per cent. on their nominal capital, and of the profits, after paying 7 per cent., 25 per cent. should be kept back by the company to be re-invested in this country, the balance to go to the shareholders. The 25 per cent. to be applied to opening new mines, building railroads, or fostering the farming industry, or other industries in the country.

2629. Suppose a company earns 20 per cent., you say 7 per cent. should go to shareholders?—Yes.

2630. Leaving 13 per cent.?—No, I say 7 per cent. on the amalgamated capital—not on the individual capitals. Because if a company to-day earns 20 per cent., then the shares which it would get in the new company would be accordingly. And on these new shares the 7 per cent. would be equal for all, whether to-day they earned big dividends or small.

2631. And having paid 7 per cent. to its shareholders, of the balance 25 per cent. is to be retained by the company for re-investment in the development of this country?—Yes, I think that is a very good feature of the amalgamation, and very much in the interests of this country. Because you always hear that the mining industry is getting all it can out of the ground and sending it abroad.

2632. And that money should be invested on a commercial basis, and with a view to the benefit of the country?—Yes.

2633. **(Mr. Sinclair.)** You spoke of the wastage: would it not be possible to get a fuller working capacity without an amalgamation?—Well, it is very difficult to say, as long as this competition exists. It must lead to inefficiency.

2634. It would seem obvious that if six or more bodies combine there must be produced greater economy, but what is in my mind is who is to pay for it? There would necessarily be less competition for wages, to begin with?—Yes.

2635. Would not that result in reduction of wages?—No. Because, as I said from the beginning, that was not in my mind.

2636. I know it may not be your intention, but the worker would not have the open market he has to-day. Do you not think that the effect of your proposal would be to limit the worker's market in which he has to sell his labour, and that he would have to take less?—He is not forced to sell it in Johannesburg. He can go to other places.

2637. The alternative then is that he must go elsewhere?—Yes, if the necessity arises, but I do not see why it should if he is a good workman.

2638. You think that the economies which would be brought about by amalgamation would leave a larger margin to pay the worker wages?—Yes.

2639. **(Mr. Lorimer.)** Does the General Mining and Finance Corporation own any mines?—No, they control them. They have interests in them.

2640. In what sense?—They have the management of the mines.

2641. What do the Boards of the mines do if an outside body controls them?—No outside body controls them. The Directors of our Corporation are on the Boards of the companies.

2642. Are your proposals founded on a practical knowledge of the mines or only on theories?—I have been 22 years in this country, connected with mining.

* The witness subsequently furnished a further statement, which is printed as Appendix XII., p. 115.

2643. Do you mean you have managed mines?—No. I am not a mine manager.

2644. Your suggestion is that the amalgamation of the whole Rand would benefit the country, the shareholders, and the workers?—Yes.

2645. You say great economics could be thereby effected?—Yes.

2646. But do you think it possible that one man could be at the head of the mines over 50 miles and control them as effectively as they are controlled to-day?—More effectually.

2647. On what ground?—Because I am afraid that the different heads now controlling the industry are not working harmoniously together.

2648. Does not your proposal rather suggest that all industrial organizations should be controlled by one man?—It depends where they are situated and upon their extent.

2649. It seems to me your arguments imply that in any industrial organization it is better there should be no competition but one huge controlling power?—No, I do not say that. Another industry may be too large, but this is not.

2650. You make fairly clear several important advantages to be derived from amalgamation, but I have been unable to follow you where you refer to the advantages to be derived by the men. Do you think it would be to the advantage of the workman here that all competition for his services should be eliminated?—Yes, because the competition now brings him no advantages.

2651. You mean to say it would be better that the man should be at the mercy of one employer than that he should be free to choose and make his own terms?—Yes, in this instance, but he can still make his own terms.

2652. Do you think the men themselves are likely to share those views?—I do not see why not. They may not to-day, but I think they will in future.

2653. You think that yours being a logical conclusion they must of necessity come to it?—Yes.

2654. But there are others, are there not, who appear to think that if your proposals were carried into effect it would be resented by the men and would lead to a serious upheaval?—I think that if there are such they are mistaken.

2655. Do you think that the miners have not benefited in the past from this competition, and they would be better off to-day under one huge concern?—Yes. The present competition is bad for the workman, bad for the industry, and bad for everybody.

2656. **(Mr. Garnett.)** You say that you think it would be to the advantage of the worker, but is it not a fact that the best conditions for the worker tend to attract the best workmen?—Yes, but it all depends on what you call the best conditions.

2657. Assuming all other things to be equal, the best workmen will go where there is most money?—Not always.

2658. But assuming that that tendency does exist, is it not a disadvantage to the poorer mines to be able to attract only the worst and less efficient workers?—That is what they are doing.

2659. I mean, given varying conditions in the same industry at different mines or works, is it not the natural tendency of things for the best men to go where the most money is to be made?—If the conditions are the same; but they are not to-day.

2660. If the best men go where the most money is, does it not leave the less efficient to go where there is the least money to be earned?—That may be so, but to-day very often the good conditions are present where the lesser money is to be earned, and *vice versa*. I want to make conditions good everywhere. If the conditions on mines where less money is to be earned are better the worker would prefer to go to that mine because of the many other advantages.

2661. You are introducing a number of factors that all have weight, but the assumption that I was about to make was this, that, conditions being equal, the only attraction in a particular mine or works being the prospect of making more money, would not that bring the best men to that place and would not that leave only the residue of inferior workmen to work at the place where less money could be earned under the same conditions of housing, working, and so on?—Yes. That is in favour of my argument. After all, the workman is not limited to the Witwatersrand.

2662. But would that help the mines here?—Yes, you would get the best labour afterwards.

2663. I only want to ask you one general question, that, if there are a score of different works in any part of the world, is not one inducement to people who engage in that industry to go into that neighbourhood and eventually find their way to where the most money can be made?—Yes.

2664. And unless you standardize the wages throughout that particular industry, so that a man giving so many hours' work shall receive the same remuneration, can you expect people to go into works without hope of promotion: can you expect the same class of man to be attracted?—No, but they will have promotion here.

2665. Even in face of this close competition?—Yes.

2666. **(Sir Alfred Bateman.)** Have you contemplated the State interfering with this great corporation?—Yes, but I do not see why they should interfere more than they do to-day. Because the amalgamation would be to the benefit of the country, in my opinion.

2667. Do you not see what they are trying to do in America, for instance, where under the Sherman Act they are trying to regulate these great corporations and trusts?—But this is not a very great corporation. Have you not in England railway companies three or four times as big as this?

2668. But there is plenty of railway competition in England?—And there is a lot of mining competition in South Africa.

2669. But you take in the whole of the Rand?—But this is only one district.

2670. A rather large one, is it not?—Yes, comparatively.

2671. Are you prepared to see the State take it over?—Yes, if they pay for it.

2672. It would not make any difference, would it, in regard to your stores, as to where they come from?—No, I think not.

2673. Would it be more or less free?—Just the same as now.

2674. They are not exclusively British?—No, there is competition.

2675. You have no particular preference for the Mother Country in the matter of buying stores?—I think the general feeling is to buy in the best market.

2676. In fact, you would like to use a foreign port and buy German or other goods if they were cheaper?—No, I would not like to see that, but it would not be economical to pay 20 per cent. more for British goods.

2677. Well, 5 per cent.?—You do that now, because of the duty.

2678. You have no preference?—No.

2679. **(Mr. Tatlow.)** Do you know the number of white workers on the Rand?—27,000.

2680. Do you think they would view with favour the creation of such a great monopoly as this?—I do not see why they should not favour it.

2681. But suppose they did not favour it, is it not worth while to take them into account for the sake of peace and quiet?—Certainly.

2682. You are not certain. But it occurs to me they would raise a great outcry?—I think they would sooner deal with one head than many.

2683. **(Chairman.)** I take it your view is that the conditions of white labour with this constant roaming about are not satisfactory?—Very unsatisfactory. The men have no steady employment.

2684. Are there many men who leave the fields with a considerable sum of money acquired here?—I hardly think so.

LIST OF APPENDICES.

V.—MINING AND MINING CONDITIONS.

Page.

APPENDIX I.—Evidence given by Mr. James Malcolm, Mr. J. Logan, and Mr. William Bekenn, at Newcastle, Natal, on 23rd March, 1914, before a Committee of the Commission 104

APPENDIX II.—Letter from Mr. Warington Smyth, Secretary for Mines and Industries, dated 18th March, 1914, as to deposits of iron ore in Griqualand West... 105

APPENDIX III.—Memorandum (extracts) furnished by Mr. J. T. Williams, of the Natal Navigation Collieries and Estate Co., Ltd., on the coal-mining industry of Natal ... 106

APPENDIX IV.—Statement on the future of the gold-mining industry of the Witwatersrand, presented to the Economic Commission by the Transvaal Chamber of Mines 108

APPENDIX V.—Statement on the systems of underground contract work in the Witwatersrand mines, presented to the Economic Commission by the Transvaal Chamber of Mines ... 109

APPENDIX VI.—Letter from Mr. R. Shanks, Inspector of White Labour, Johannesburg, on the subject of objections to the contract system of payment of white miners on the Witwatersrand 110

APPENDIX VII.—Memorandum on "Segregation," by Mr. Howard Pim, Johannesburg 110

APPENDIX VIII.—Statement by Mr. R. W. Schumacher, as to sums taken home by natives after working on the Witwatersrand mines 112

APPENDIX IX.—Memorandum from the Witwatersrand Native Labour Association, Ltd., as to sums taken home by East Coast natives after service on the Witwatersrand 113

APPENDIX XVI.—Note by Mr. W. Lorimer on a visit to the South African School of Mines and Technology at Johannesburg on April 2nd, 1914 118

APPENDIX XVII.—Note by Mr. W. Lorimer on a visit to Vereeniging on April 7th, 1914 ... 118

APPENDIX XVIII.—Evidence given before a Committee of the Commission at Johannesburg by Mr. C. F. Stallard, K.C., and Mr. R. W. Msimang and Mr. C. S. Mabass on 4th April, 1914 119

APPENDIX I.

NATAL.

Newcastle, Monday, 23rd March, 1914.

EVIDENCE TAKEN BY A COMMITTEE OF THE COMMISSION CONSISTING OF SIR H. RIDER HAGGARD, MR. T. GARNETT, AND THE HON. E. R. BOWRING.

(i.)

Mr. James Malcolm gave evidence as follows:—

I am a mine manager, but at present I am not occupied in Natal. The points upon which I wish to give evidence are the coal areas. I have been mining all my life—both coal, ironstone, and shales. There is a lot of coal around this district to be taken out, both north and south, and it lies from 3 feet to 19 feet in thickness.

In the district of Utrecht is some of the best shale found in the Colony, yielding 40 gallons of crude oil per ton to 70 lbs. of ammonia. In this locality a large industry could be made out of coal.

There are large patches of ironstone which can be wrought. I have seen ironstone over 10 feet in thickness, and I believe it would give from 80 to 90 per cent. of iron.

1. **(Sir Rider Haggard.)** From what you tell us, there is an inexhaustible supply of coal in this neighbourhood?—There is. You don't require to sink very deep, as it crops out to the surface somewhere. The greatest depth would not be more than 500 feet.

2. How many collieries are working in this district?—Only two—Fairleigh and Newcastle.

3. What is the quality of the coal?—Very good. There is some coal here which is nearly as good as Welsh coal, but it is not washed and dressed and put into different sizes. If it were, it would be almost equal to the Welsh anthracite.

4. Is the industry profitable?—Yes. It pays at 6s. per ton. The principal mines are giving about 7½ per cent. on the capital.

5. Are the mines scientifically worked?—Yes.

6. Is there any waste?—Yes, an enormous waste. We have plenty of coal, but it is extravagantly destroyed. I would stop it by law.

7. Do you know whether any representations have been made to the Union Government?—I don't know.

8. How does your coal compare with that of other collieries?—It is better than Transvaal coal, and there is an inexhaustible supply.

9. Is the iron in proximity to the coal?—Yes.

10. Is it easily smelted?—There are the same difficulties as at home.

11. **(Mr. Garnett.)** You mentioned hæmatite iron. Have you any analysis?—I cannot say.

12. With regard to smelting—have you plenty of limestone?—I have not seen any.

13. With regard to coal—you say there is an inexhaustible supply. It does not lay to any great depth?—No.

14. You can only say you believe the amount of coal is very large?—Yes.

15. Have you any analysis showing the thermal units of this coal you are speaking of?—The units

are from 10 to 12½. This refers to the coal between here and Utrecht. It is nearly equal to Welsh anthracite if it is properly handled on the surface.

16. **(Mr. Bowring.)** With regard to oil shales. Are any of them working at present?—No. They have been traced at the foot of the mountains for several miles, and several have been tested, averaging 40 gallons of oil, and some from 56 to 76 lbs. of sulphate of ammonia per ton. The Scotch article gives an average of 23 gallons, and from 36 to 70 lbs. of sulphate of ammonia. They are of better quality than the average Scotch, so far as analysis goes.

17. **(Sir Rider Haggard.)** Are you sending much coal down country just now?—No, the coal here is used for railway consumption, and large quantities go for shipping.

(ii.)

Mr. J. Logan said:—

At present I am under-manager of the Fairleigh Colliery. As far as I know, we have good coal, but how many acres, I cannot say. So far as we have gone with boring we have found good coal. With regard to its thickness, we have about 11 feet of carbonaceous matter.

The roof, where we are working at the present time, appears to have undergone some metamorphosis. The further we go down the better the coal is getting, and we hope in a short time to have a large area of coal. I estimate we shall probably have 5 million tons in that mine.

18. **(Sir Rider Haggard.)** What is the acreage you are mining?—About 1,800 acres. A former company owned the mine, and, I am told, certain big pillars were left to support the roof, and that a new manager coming on the scene, and being desirous of making a name for himself by increasing the output, worked on these pillars until they were unable to support the roof, and the whole thing fell in.

19. What is the financial result of your operations?—The capital of the present company is 20,000*l*. It has been working for about twelve months, and the coal realises at the pit's mouth about 6*s*. 6*d*., and is used principally for railway purposes.

20. **(Mr. Bowring.)** Your output is about 3,000 tons per month?—Yes, but we hope to increase it very shortly. We hope to get it to 6,000 tons per month. It may be increased still further by putting down extra plant. The quality compares very favourably with any other, its main feature being that it does not clinker.

21. Do you endorse the last witness's comparison with Welsh coal?—I certainly do not think we have anything approaching Welsh coal in this country. The nearest I have seen to it is a Swaziland coal. I have not gone into any comparison between Natal coal and Welsh coal for household purposes.

22. What percentage do you suppose the semi-anthracite coals fall short of Welsh coal?—If Welsh coal be taken to represent 1, I should expect Natal coal to represent ·75.

23. Do you know of any deposits of iron ore in this neighbourhood?—I have never seen any ironstone in this district, although I saw a small portion on the Buffalo flats. I do not know of any ironstone in this part of South Africa which is workable.

24. **(Mr. Garnett.)** Do you know of any coal in this immediate district suitable for coking?—I could not say. A good coking coal has to be put through a very severe test. I have no data to go on.

25. **(Sir Rider Haggard.)** About these oil shales. Have you any experience of them?—No.

(iii.)

Mr. William Bekenn said:—

(*For evidence of this witness as to Railway Rates on Coal and Coal Bunkering, see p.* 146 *of* [Cd. 7706].)

I am manager of the Fairleigh Colliery. I think the last witness has covered area, quality, and prospects of the coal.

We have only been running twelve months, but we have been very successful, and our position is improved by the Government taking all our coal. The other collieries working in this district are the Newcastle, Ballengeich, and the Utrecht Mines, the three mines being of much the same quality.

26. **(Mr. Garnett.)** Have you a sufficiency of labour?—We have had great difficulties in this respect, but it is coming in more freely now. Still, labour in every industry in South Africa is under-manned. The Zulus go to Johannesburg principally for house-work.

27. What are the hours on the mines?—Ten hours a day, but the hewing boys seldom stay down more than eight hours.

28. What can a miner make, on an average?—He can make 2*s*. a day, but we feed and house them, and find them medical attendance. The total wages paid, including everything, works out at about 3*l*. 16*s*. per month.

29. Have you any piece-work?—It is practically all piece-work. The boys could make their wages 4*s*. per day by overtime, but they won't.

30. **(Mr. Bowring.)** How do you find the health of your boys?—Particularly good. We have very little sickness. I believe much of the sickness on other mines is caused through boys coming from their native country and going to such high altitudes as Johannesburg, &c.

31. **(Mr. Garnett.)** Of course, your mining is almost entirely surface mining?—Yes. We have two mines working from 400 feet to 500 feet, but, practically, all our work is done at 100 to 150 feet.

APPENDIX II.

Letter from Mr. Warington Smyth furnishing information as to Iron Ore Deposits in Griqualand West (*see* his Evidence, Q. 43, p. 3).

Union of South Africa,
Office of the Minister of Mines,
Cape Town,
March 18th, 1914.

Sir,

With reference to my evidence, in which slight reference was made to the iron ore deposits in Griqualand West, I beg to forward herewith, for the information of your Commission, a report by the Assistant Director of the Geological Survey on the occurrences in that district, which gives their character in some detail.

I think it is possible, from the wording of my replies, that I may have given the impression that this deposit is of recent discovery. I should have explained that the original discovery was made some twenty years ago, I believe, by Mr. Percy Johns, but that at the time there seemed no possibility of bringing the deposits into any closer contact with civilisation, owing to their great distance away in an inhospitable region. It has only been in recent years, when railway development has been on the increase, that attention has been redirected to these deposits. Even at present, however, their distance from the main lines of railway seems to indicate that some time must elapse before they can be profitably exploited.

I have, &c.,
H. Warington Smyth,
Secretary for Mines and Industries.

To the Secretary,
Dominions Royal Commission,
Huguenot Buildings.
Cape Town.

Enclosure.

Note on the Iron Ores of Griqualand West and Bechuanaland.

The ores are found in two ridges, 28 and 30 miles long respectively, in the neighbourhood of Postmasburg and Gamagara. They lie about 100 miles west of the railway between Windsorton and Taungs. There are also isolated patches of ore in the neighbourhood of these ranges.

The distribution of the ores is shown in Sheet 45 of the geological map of the Cape Province, in which

they are represented by the colour for "Blink Klip Breccia."

The ores are hæmatite and magnetite mixed with silica, and four specimens were found to contain 42, 53, 56, and 67 per cent. metallic iron; the lowest percentage was not in one of the ores, but in a rock which probably represents the material from which the ores were produced by concentration. The analyses were unfortunately not completed, and the percentage of detrimental ingredients, such as titanic and phosphoric oxides, are not known. From the nature of the ores, however, they are likely to be fairly free from those substances, which are usually abundant in the magnetic ores associated with igneous rocks, but not, as is the case here, in those derived immediately from sediments.

The ore bodies were formed by the concentration of iron oxides contained in a formation which has a very much wider distribution than the masses of ore. The geology of the ore bodies indicates that they will not extend to any great depth: though I cannot put any definite limit to their depth, it is more likely to be less than 200 feet than over that figure. As the hills made of the ore are of various heights up to about 400 feet, and in places are over a mile wide at the base, it is evident that large quantities of ore exist.

At the present day ores containing 50 per cent. of iron are very largely worked outside Europe, where the percentage in payable rock may be much less. The percentages of titanic and phosphoric oxides are, however, as important as the quantity of iron. The amount of silica is also important, as ores which are high in silica have to be concentrated artificially, and the admissible limit in silica depends upon circumstances.

A proper estimation of the quantity and quality of the ores can only be made after systematic prospecting by bores or shafts. An estimate based on surface specimens only might be very misleading, because it is not known whether some enrichment has taken place at the present surface or not. The deposits are of an unusual character, and experience elsewhere cannot be safely used in forecasting their behaviour below the outcrops.

The deposits are certainly worth close attention, and further information as to their composition could be got by having specimens already collected fully analysed in the laboratory of the Department.

APPENDIX III.

MEMORANDUM (EXTRACTS) FURNISHED TO THE COMMISSION BY MR. J. T. WILLIAMS, MANAGING DIRECTOR OF THE NATAL NAVIGATION COLLIERIES AND ESTATE CO., LTD., ON THE COAL MINING INDUSTRY OF NATAL.

(*For the oral evidence of Mr. Williams, see pp. 24 to 26.*)

As to the extent of the Natal coal-fields, there is an exhaustive report in existence, dated September, 1881, by F. W. North, an English mining engineer, and Fellow of the Geological Society. Mr. North was appointed by the late Natal Government to investigate and report on the coal measures of the Colony. He was engaged on the work for fifteen months, and finally reported that he estimated Klip River County, Northern Natal, contained 2,073 million tons of coal, after deducting 50 per cent. for dykes, faults, &c.

The report did not include the extensive coal-bearing areas of the new districts, Utrecht and Vryheid, which were added to Natal after the Boer War, nor does it include the coal and lignite deposits of Zululand. The lignite deposit in Zululand is extensive, but, so far, nothing has been done with it

It was not, however, until 1889 that any serious attempt was made to develop the coal measures. At that time a number of companies came into existence, of which only two—the Dundee Coal Company and the Elandslaagte Coal Company—have survived. (The original field floated by the Dundee Company was exhausted nearly two years ago.) The remaining companies came to an end for various reasons. In 1898, the serious strike of miners in the Welsh coal-field increased the price of coal produced elsewhere and led Transvaal mining men to the Natal coal-fields. Two of the companies they promoted—the Natal Navigation Collieries and the Natal Marine Collieries, turned out successfully. The former is still in existence, but the latter was exhausted in 1903, after distributing in cash 20*s.* 6*d.* per share. High prices for coal obtained during the war led to further promotions, and increasing attention came to be paid to Natal coal-fields.

From Mr. North's estimate of 2,073 million tons, it would seem at first sight an easy matter to float any number of coal companies in Natal, but closer acquaintance with the nature of the coal deposits and of the geological characteristics of the district proved that the coal in large areas is not suitable for the market.

A very large proportion is unsuitable because anthracitic, and cannot be used on the railways nor by steamers trading with the Province; large areas are broken up, in some parts the seams are thin, but there still remain enormous areas of coal untouched.

Present output.—The output of coal in Natal during the past few years has been as follows:—

	Tons of 2,240 lbs.
1910	2,296,687
1911	2,394,238
1912	2,472,085
1913	2,608,408

Expansion of the output mainly depends on the increase of coal shipped as cargo, but increases will also come about by industrial expansion in South Africa itself, largely depending on cheap fuel, which, in turn, depends on:—

(*a*) Lower working costs—Labour: white, coloured; stores: mealies, rice, fresh meat, &c.

Wages and cost, both of white and coloured workmen, are increasing. Cost of mealies depends mostly on favourable seasons, the price per bag of 200 lbs. varying from 8*s.* or 9*s.* to even 15*s.* and 20*s.* At present, the price is about 10*s.* to 11*s.*

(*b*) Lower railway rates. (*See* "Railways, Harbour and Bunker Coal," Appendix III., p. 148 of [Cd. 7706].)

Supply and Recruitment of Native Labour.—The Government issues monthly returns showing the number of whites, Asiatics, and natives, respectively, in the service of each colliery in Natal. The average labour in service on Natal coal mines for the last two years has been as follows:—

Year.	Whites.	Asiatics.	Natives.	Average Monthly Output.
				Tons.
1912 ..	508	4,213	6,050	206,009
1913 ...	545	3,773	7,376	217,367

At the request of the Natal Labour Department, an inquiry was made of the Natal collieries the other

day as to what quantity of labour would be required to enable the collieries to deal adequately with normal outputs. According to replies received, the number required would be 14,400, or 4,000 more than the number of Indians and natives now employed.

It is important to notice that the number of Indians employed is about one-third of the total, and that the number is decreasing owing to the Indians being dissatisfied in regard to the 3*l.* tax per head, marriage laws, and restriction of movement in the Provinces of the Union.

Costs. (a) *Indians.*—The greater number of Indians are employed under indenture. They have been recruited originally in India for a term of five years, the rates of pay being as follows:—

Men.

First year	12*s.*	monthly, for surface work at collieries, and 3*s.* additional in each case, if working underground.
Second ,,	13*s.*	
Third ,,	14*s.*	
Fourth ,,	15*s.*	
Fifth ,,	16*s.*	

Women.

Women under the five years' indenture agreement receive:—

First year	5*s.* per month
Second ,,	5*s.* 6*d.* ,,
Third ,,	6*s.* ,,
Fourth ,,	6*s.* 6*d.* ,,
Fifth ,,	7*s.* ,,

They are employed to a limited extent, and only on the surface (none underground).

On the termination of their indenture for five years they must either (*a*) return to India, (*b*) re-indenture for a further term of two years, or (*c*) pay a tax of 3*l.* per head if they elect to become what is known as "free" Indians. To this general description there are few exceptions. On the expiration of their five years' indenture, the Indians have, of late years, especially since 1912, when importation from India was stopped, re-indentured only on getting substantially increased rates of pay, and gradually re-indentured Indians are getting as much as the average native.

An analysis of the monthly rate of pay for indentured Indians (men) on one of the large collieries gives the following result:—

Paid 50*s.* and upwards per mensem	180
Paid 40*s.* and not exceeding 50*s.*	100
Paid 25*s.* and not exceeding 40*s.*	130
Paid under 25*s.*	60

The Indians getting 25*s.* a month and over are re-indentured Indians. Those receiving 20*s.* and under are serving under their first five years' agreement. In addition to the above rates of pay the Indians have to be provided, free, with quarters and rations, of a quality and quantity approved of by the Head of the Indian Immigration Department in Natal, Mr. Polkinghorne, the Protector. The cost of food for the Indians is from, say, 14*s.* to 15*s.* per capita per mensem.

In addition to indentured Indians the mines employ a number of "free" Indians, who are employed under somewhat the same conditions as natives. The Indian is more suitable for work requiring a little intelligence than the native, but, on the whole, the native is the more desirable workman, because his greater physical strength enables him to handle the larger tonnage in the winning and moving of coal underground.

The costs of recruitment of indentured Indians are heavy. They are paid to the Government Immigration Department, and are made up as follows:—

For Indentured Indians.—Up to December 31st, 1912, 5*l.* 10*s.* per capita per annum for five years. From January 1st, 1913, 3*l.* 10*s.* per capita per annum (remainder of first five years' indenture).

Re-indentured Indians.—3*l.* 10*s.* per capita per annum for the first two years' re-indenture. 2*l.* 10*s.* per capita per annum for the second two years' re-indenture. 1*l.* 10*s.* per capita per annum for any subsequent period of re-indenture.

The above costs have to be borne by the collieries. In addition, the collieries have to pay 9*d.* per man a month for medical fees and 1*s.* a man a day for hospital fees when in hospital.

The hours of labour are nine daily, between sunrise and sunset, with a break of at least an hour for rest. The food per Indian per working day works out roughly as follows:—

Meal	·90 lbs.
Rice	1·70 ,,
Mutton	·32 ,,
Vegetables	·14 ,,
Dholl	1·16 ,,
Ghee or oil	(small)
Salt	,,

At the mine concerned, the mutton is made up of 1 lb. per week in two portions, Wednesdays and Saturdays.

Natives employed by the mines usually contract for six months at a time, and in most cases return to their homes before re-engaging for a further term of service. In Natal, there is no Native Labour Recruiting Association as in the Transvaal. Each colliery makes its own arrangements both as to agents, terms of recruiting, and as to wages paid. The premiums paid for recruiting vary, say, from 2*l.* 10*s.* to 3*l.* 10*s.* for six months boys, and as much as 5*l.* and 6*l.*, and sometimes more, is paid for boys who contract for twelve months. Natives new to mining work are of little value for a few weeks, and it is, therefore, sound economy to pay the higher premium to secure a longer period of service, as the average period of efficiency is thereby increased.

The costs of recruiting are considerably increased by the large number of desertions. No statistics are available locally as affecting the industry as a whole, but a recent enquiry indicated that the desertions amounted to an average of 12½ per cent. per annum of the number engaged during the year. Most of these desertions take place within a short time of arrival at the colliery, and, if the natives are not recovered, the colliery loses the premium, the railage, and cash advances made to the native on his signing the contract.

In Natal the Pass Laws are very defective as compared with those prevailing in the Transvaal, and representations have been made to Government by the larger industries with a view to getting a more efficient pass system established, enabling the employer to control more closely the employment of natives and the recovery of deserters. Such a system would involve a pass being issued to each native on entering service, and the issue also of a monthly service certificate. Owing to the growth of industries generally and the expansion of coal-mining, the difficulty of securing an adequate supply of native labour is increasing yearly, especially since the stoppage of the immigration of indentured Indians in July, 1912.

The native pay for underground men varies from 1*s.* 2*d.* to 2*s.* per shift, or from 35*s.* to 60*s.* per month of 30 shifts. The average cost of food for natives per capita varies from, say, 10*s.* to 12*s.* 6*d.* a head a month. In addition, a mine has to pay cost of hospitals and medicines, so that the average cost a head a month is from 50*s.* to 60*s.*, which includes pay, food, hospital, medicines, premium, and other costs incidental to securing labour. The food of a native works out somewhat as follows per working day (with variations at different mines):

Mealie meal	2·50 lbs.
Beef	·34 ,,
Vegetables	·20 ,,

Fresh meat is allowed twice a week, ½-lb. a head on each occasion. A recent analysis of the number of natives at a certain colliery at different rates of pay gives the following results:—

Paid 60*s.* a month	315 natives
Paid 50*s.* and up to 60*s.*	130 ,,
Paid 30*s.* and up to 50*s.*	160 ,,
Under 30*s.*	30 ,,

The number varies from time to time, but the above will sufficiently indicate the prevailing rates of pay.

Financial.—At the end of 1912 the total ordinary issued capital of Natal collieries was 2,396,188*l.*, preference share capital was 325,000*l.*; debentures outstanding amounted to 330,653*l.*; and temporary advances to 102,170*l.* These figures do not include three private concerns with an average capital of about 90,000*l.*

Except in case of some half-dozen companies, the colliery profits distributed to shareholders have not been satisfactory.

No dividend has yet been paid on a large proportion of the output, although some very remunerative tracts of coal-bearing ground have been worked. Notwithstanding the increased prices obtained in 1913, the dividend total has not been much increased. During the three years of lowest prices, namely, 1910-1912, the dividends distributed were 54,489*l.*, 51,100*l.*, and 71,687*l.*, respectively, as against 67,700*l.* so far declared for 1913, a year in which, according to critics, the collieries have been putting up prices to an inordinate extent.

APPENDIX IV.

STATEMENT PRESENTED TO THE ECONOMIC COMMISSION BY THE TRANSVAAL CHAMBER OF MINES ON THE FUTURE OF THE GOLD-MINING INDUSTRY OF THE WITWATERSRAND.

(*See Evidence of* MR. NEUHAUS, *Q.* 1641, *p.* 55.)

No accurate computation of the life of the gold-mining industry is possible, because there are so many unknown factors which bear upon it. The value of ore developed can be assessed with considerable precision, but below the developed area values and quantities can only be estimated, and the question of the quantity of ore which it may be profitable to work naturally depends upon the gold contents and the cost of working.

The accompanying map* of the Witwatersrand has been compiled from all available authentic data. The outcrops of the principal gold-bearing reefs are shown, and in the case of the Main Reef series the reef has been traced almost continuously from Randfontein on the West to Holfontein on the East, a distance of 62 miles. The map is self-explanatory, but on account of the small scale it was found impracticable to distinguish areas already exhausted from the ore developed or partly developed in the mines. It will be noticed that a line has been drawn which is assumed to include the ore body down to a vertical depth of 7,500 feet. The dip of the reef in the lower workings of the mines is for this purpose assumed to continue unaltered, and information through the medium of boreholes, where available, has been made use of. 7,500 feet has been arbitrarily taken because the Mines Department has intimated that it is not at present willing to consider the proclamation of ground in which the reef is estimated to lie below this depth. But there is no definite evidence to-day that it will be profitable to work at that depth, or that it will not be profitable to work at a still greater depth.

In order to form some idea of the outlook, a calculation has been made as to the potentialities of the present producing mines.† Tonnages and values have been arrived at by applying without modification to the remaining undeveloped ground the average data disclosed in the last 1,000 feet of all the workings throughout the length of each mine. No allowance has been made for any possible flattening of reef or alteration of yield which may occur. Working costs are taken at 18·61*s.* At present working costs (which average 18·61*s.*) there would appear to be about 550,000,000 tons of ore to be worked in the mines referred to, which will yield in gold more than the cost of working. It is noteworthy that this involves the expenditure of nearly 500,000,000*l.*, almost entirely in this country, spread over a number of years. Besides the tonnage available on this basis of calculation, there is in all the mines a large quantity of ore below the value referred to. A fall in working costs would render it possible to work a certain quantity of this ore.

Moreover, in this estimate no account is taken of mines developed and equipped which have been closed down because the working costs exceeded or equalled the yield. In this connection it should be stated that several large properties are now being worked with a bare margin above cost. Any increase of cost would necessitate the cessation of their operations.

Given an adequate labour supply, it would seem that for the next five years there is no reason that a rate of crushing equal to about 28,000,000 tons per annum, roughly speaking the present annual milling capacity, should not be dealt with; but after that date, owing to the exhaustion of some of the shorter-lived properties, the annual output would decrease, and it is estimated by the year 1930 it would fall to about half the figure quoted.

It may be well to emphasise the fact that the calculation referred to applies exclusively to *present producing mines.*

Besides these mines there are three areas, comprising a total of 4,140 claims, in the East Rand locality, in which development is proceeding at the present time. Their combined prospective milling capacity may be taken at 1,800,000 tons per annum. It is probable that half this tonnage may be dealt with within the next few years.

There are eight other properties, mostly in the same locality, comprising an area equal to 6,420 claims, in which a considerable amount of development work has been done. All of these claims are now lying idle because the funds provided for development have been exhausted, and the ore values so far encountered have not been sufficiently encouraging for investors to provide further capital under existing conditions. It is impossible to predict the result of further exploration in these claims, but there is no doubt that any marked decrease of working costs brought about in the present producing mines would have a great bearing upon the provision of further funds for those properties.

Besides these 10,560 claims there are in the same district, namely, the far Eastern Rand, approximately 86,000 claims under which the Reef is known to lie at varying depths, the mining rights of about four-fifths of which are vested in the State. It is impossible to forecast, even within wide limits, the amount of workable ore which this large area will eventually produce, and consequently the extent to which it bears upon the future life of the Witwatersrand. A good deal of exploratory work by means of boreholes has been carried out, and although prospecting through this medium is admittedly very unreliable, the results have not been encouraging, and therefore a considerable portion of this area must be regarded as of doubtful mining value. This portion of the Witwatersrand contains only one reef, lying at a slight inclination from the horizontal, and therefore, at best, the tonnage per claim will be considerably less than that of the claims in the Central Rand.

The areas above referred to on the far Eastern Rand contain hundreds of millions of tons of ore, but an enormous capital outlay, the extent of which it is needless to discuss now, will be required for its development. Indications as to value are admittedly very meagre. The little evidence which they do furnish is not of a very favourable character. It is also of some interest to point out that the characteristics of this region are not quite similar to those of the Central Rand. In the East Rand the gold is deposited largely in specific sections, some of which are likely to contain good values, while others are likely to be practically barren.

On the South-Western Rand there are also unproved areas of which little is known. Bore-hole results have not, on the whole, been encouraging. The sinking of a vertical shaft was started on the Western Rand Estates, but owing to the large quantity of water encountered in the dolomite, work was suspended. The data available in regard to this locality do not warrant any estimate as to the part it will play in the history of these fields. Stress should again be laid upon the fact that bore-hole results are of little value

* Not attached.

† This refers to 42 out of the 51 gold mines at present producing on the Witwatersrand. The remaining nine mines do not materially affect the position.

beyond proving the presence of the beds. There are instances of bore-hole values having been unsatisfactory, where the subsequent opening up of the properties by shafts and drives has disclosed profitable mines. On the other hand, there are cases where good indications from bore-holes have not been supported by subsequent operations.

There are other potentialities, such as the Kimberley Reef series, which is certainly low-grade in the Central Rand, though portions of it have been profitably worked on the Western Rand. The same remarks are no doubt applicable to the sedimentary deposits of Potchefstroom and Klerksdorp.

The essential point to bear in mind in attempting to form any estimate of the future of gold-mining in this part of the Transvaal is that under the existing working conditions the field is not attractive to capitalists. In this connection it is pertinent to point out that a shilling reduction in working costs represents 1,400,000*l.* of increased profit in working the 28,000,000 tons referred to as the annual milling capacity of the present producing companies. It is quite true that any increase of profit does not greatly affect the South African public, because it is not largely interested in the proprietorship of the gold mines. The indirect benefit, however, of increasing the profits on the existing mines may be important from the standpoint of South Africa, because it is from the shareholders in the existing producing mines mostly that capital must be looked for for the working of the unexplored areas, and the making of their present holdings more remunerative would be a considerable inducement for them to venture further capital in new enterprise.

It is therefore suggested that as the gold mines at present provide such a large proportion of the sustenance for the population of this country, and almost exclusively through the distribution of their working costs, every effort should be made to lower the cost of production in the existing mines with the object of attracting capital for the opening up of other mines which may take their place as the period of exhaustion arrives.

That the mining industry has been made to bear enormous burdens is incontestable. Direct and indirect taxation through the Customs, railways and profits tax, heavy outlay owing to the immense number of mining regulations that have been promulgated, and expenditure under the Miners' Phthisis Act, are all factors tending to discourage new mining enterprise. Under the system which has grown up the white working classes live upon a higher plane than is customary in other countries, with results which are reflected in the wages bill of the mining industry.

Attention is drawn to these matters because the general community appears apathetic concerning, or indifferent to, mining costs. Their interest, regarded superficially, lies, it is true, rather in the amount spent than in profits earned, but holding in view the limited amount of ore workable at present cost per ton, it becomes evident that the permanent interests of the country, and of commerce, are deeply concerned in the attraction of fresh capital for mining enterprises. Upon the expenditure of such capital, and in the subsequent working of any properties that may be brought to the producing stage, abiding welfare depends.

APPENDIX V.

STATEMENT PRESENTED BY THE TRANSVAAL CHAMBER OF MINES TO THE ECONOMIC COMMISSION SUMMARISING THE POSITION REGARDING THE SYSTEMS OF UNDERGROUND CONTRACT WORK AT PRESENT IN FORCE ON THE MINES

(*See Evidence of* MR. NEUHAUS, *Q.* 1657, *p.* 56.)

At the present time many Consulting Engineers and Managers are in favour of a contract system of some kind for certain classes of white employees, and others are opposed to it.

Nearly all the Consulting Engineers have stated that, of the three systems of contract, they are in favour of the third system mentioned in the annexed statement, namely, day's pay plus bonus, or day's pay plus contract.

The Consulting Engineers consider that, with white employees generally on a supervisory basis, some incentive, dependent on the work done, should be given, and natives, where found advisable, placed on piecework, the disabilities and restrictions under which the native now labours being removed.

Irrespective of any difference of opinion as to the most effective basis upon which labour should be employed, it is unanimously and strongly held that the determination of the system of payment for the work performed should not be the subject of any legislative interference.

Contract systems in stoping, developing, and shaft-sinking. Witwatersrand Gold Mines.

There are three systems of contract in force on the mines at the present time, viz.:—

(1) *Flat Contract:* Say, *Machine Stoping.*—Contractor is given a price per fathom, and is charged by Company at set rates for boys and stores, the Company usually undertaking to supply tools, compressed air, and other necessaries free.

The Contractor receives the surplus of gross earnings over costs charged, however big it may be, and almost invariably men whom the company thinks have experienced bad luck, and have earned little or nothing under their contracts, are "made up" by the Company—*i.e.*, they are given voluntary free grants by the Company, bringing their earnings up to, say, day's pay rate.

(2) *Flat Contract with Guaranteed Wage:* Say, *Machine Stoping.*—This is exactly the same as (1), except that the Company guarantees that if the Contractor earns a surplus less than the 20*s.* or other figure set it will make him up to that figure.

The price per fathom in this case would be the same as in (1).

(3) *Day's pay plus contract and day's pay plus bonus:* Say, *Machine Stoping.*—Under this system the Contractor is paid a day's pay rate, say, 12*s.* 6*d.* per shift, quite apart from his contract, and in no way affected by the gains or losses that he may make on the contract. Over and above the day's pay rate he is then given a contract at a rate per fathom calculated so that, with reasonable efficiency, he can earn thereon the difference between 12*s.* 6*d.* per shift and the ruling standard for the class of work, or by extra efficiency he can earn a considerable increment on that standard.

The advantage of this system is that while the contract feature ensures diligence on the part of the workman in the disposal of his own and his natives' time and economy in the use of stores, it at the same time ensures him against total loss, and since only a portion of his earnings are to be made on the contract it follows that the contract price per fathom is set lower than in the case of the other systems, the effect of any error in setting the price being thus considerably reduced.

With this system, as with the other two, it very frequently happens that if the Company considers that it is a case of hard luck when a workman does badly on his contract, it practically cancels the contract and makes him a free grant.

APPENDIX VI.

Additional Statement by Mr. R. Shanks, Inspector of White Labour, Johannesburg, on the subject of Objections to the Contract System of Payment of White Miners on the Witwatersrand.

(*See* Question 1892, p. 66.)

Union of South Africa.
Government White Labour Bureau,
Johannesburg,
4th April, 1914.

Sir,

As an addition to my statement sent in, and my replies to questions before your Commission, I would present one other reason why I consider the miners' contract system objectionable.

All are ready to admit that the more dangerous the occupation the greater is the necessity for caution in carrying on the industry. Special rules and regulations are laid down and enforced in many industries, in varying forms, to meet the special requirements experience has shown to be necessary. Private industrial establishments formulate rules which have to be observed, and where private firms have neglected ordinary precautions legislative measures have been passed to compel them. Occupational diseases and dangers are often difficult to explain in a way to attract public attention sufficient to arouse public sympathy and sentiment on behalf of the victims. Until that is accomplished legislative action is seldom initiated.

It is contended by some that the employer (the capitalist) is absolutely indifferent so long as he can get his profit. My view is that his profit is equally assured under the best accident preventives.

Compensation for death and injuries are common in nearly all civilized countries, but in many instances —in most instances—the public have to carry the burden in the form of increased prices. The extraction of gold from the reef is perhaps the most notable exception to the rule. Compensation, therefore, can be estimated with comparative accuracy and ceases to be a burden to the average employer.

It is not so in the case of the gold-mine owner—the value of his product being fixed and practically immovable. That being the case, would it not be better for the mine-owner to produce a smaller amount of gold per miner employed and save an equivalent (or more) in compensation?

I find in the Government Mining Engineer's Report for the year 1912, as the result of accidents:—

	Whites.	Coloured.			Per working day.
Killed ...	54	791	= 845	—average	2·72
Injured ...	274	1,641	= 1,915	,,	6·17

I find in the same report, within the Union, compensation was paid for killed and injured 133,768*l*. Of this amount the Transvaal (chiefly the mines) paid 120,895*l*., the Transvaal share being 90·39 per cent. of the whole. In the same report the Government Mining Engineer states that the death-rate from phthisis is *at least* ten times as high as from accident.

To what extent accidents and phthisis may be attributed to carelessness, caused or increased by the stimulating gamble to secure a big cheque at the end of the month, may be impossible to estimate, but it does not require a stretching of the imagination to conclude that "contracting" in any hazardous occupation is, and must be, conducive to accidents, accompanied by indifference to the laws of health.

Compensation for accidents or phthisis does not represent the total loss to the mine-owner. Where accidents are preventable, and where time and care are given for that purpose, the owner stands to gain in other respects.

In varying degrees in addition to compensation he has to replace destroyed tools and plant; take away from their regular occupations employees to meet the emergencies, and see to the removal of the obstacles in order to continue operations as formerly; to increase expenditure in labour and material to render the place safe once more for employees to enter; and meet all other expenses resulting from dislocation in the mine.

An average result expected from miners should be as easily established as in other occupations. The greater the risk from accident or disease, the less justification there is for supporting a system which, from its very nature, tends to encourage a class, many of whom are not by any means influenced by the quality of caution.

To argue on different estimates as to the saving or loss will not solve the question. The adoption of the day's pay system by some mine or group of mines, for a reasonable period would, in my opinion, prove the fallacy of the present contract system. The loss of life in itself is not a question to be valued only on the pounds, shillings, and pence basis.

I have, &c.,
R. Shanks,
Inspector of White Labour.

The Secretary,
The Dominions Commission,
Johannesburg.

APPENDIX VII.

Memorandum on "Segregation," by Mr. Howard Pim, Johannesburg.

(*See* Question 2267, p. 82.)

The central problem of the Government of South Africa is to devise such an organization of the State as will enable the white and native races to develop side by side in equal freedom.

As long as the native remained unskilled the many problems of contact were in the background, and so far as the native labourer was concerned Government proceeded on the assumption that he was nothing more than a tool to be taken up or laid aside at will. The period during which this view of the native prevailed was extended by his habit of only working for a limited number of short periods, too few and too short to enable him to become a skilled labourer.

It is now becoming obvious that government can be no longer conducted upon this hypothesis, for as the native works for longer periods and acquires skill he comes into competition with whites, and fills more and more the semi-skilled positions through which the white youth could become a skilled workman.

It is this development which has given rise to the cry for segregation, and for the man in the street this word means not so much territorial separation as the segregation of native ability—the prohibition by law of native competition in skilled work of any kind. As long as the native assists the white and remains unskilled, make use of him; so soon as by acquiring skill he becomes in any sense a competitor forbid him to exercise that skill and cast him aside. In his mind, segregation means the colour bar in its most drastic form.

The mere statement of such a theory of native government is its own refutation. If given effect to it might not involve a condition of things which would be described by any accepted definition of the word slavery. It certainly would lead to just that deterioration of the white race which is the admitted result of slavery.

The next proposal that calls for notice is territorial segregation with prohibition of intercourse. On this theory South Africa would be apportioned between whites and natives, and each of the two communities so formed would be self-supporting and self-contained.

In white districts all work would be done by whites, and *vice versa*. Obviously this would involve a fundamental change in the lives of our white population, and to justify even an attempt in this direction there would have to be a strong feeling and a widely expressed public opinion in its favour. These do not exist, and I am not aware that any of the advocates of this proposal have even taken the initial step of doing without native assistance in their households. The Government might regulate such a movement if it once took shape, but could not initiate it.

A close white supervision would also have to be exercised over native districts. This would inevitably develop, and probably result in the gradual approximation of society in these districts to the state of things which prevails throughout South Africa as a whole to-day. The native district would become the competitor in place of the (native) individual.

It is just possible that such a policy might have proved effective if the whites in this country had never employed native labour, and if the supply of white labour available had been accepted as the factor governing the opening up of the country and the development of its industries. But this was not done, and every possible inducement was offered to the native to become a labourer, until to-day he is the foundation upon which rests the whole structure of South African economic life. To my mind it would be impossible to turn the clock back and to start all further South African development on these new lines, but at the same time the special dangers to the white community, which are features of the present state of things, must not be ignored. Dependence upon coloured labour tends to degrade the white.

Action in either direction here indicated being unwise, the natural tendencies at work call for consideration, and there is no doubt whatever that both whites and natives desire more definite territorial segregation. In many districts the conditions prevailing to-day are unsatisfactory, native lands and white being intermingled — a condition disliked by both; and this desire for segregation is not confined to the whites or peculiar to South Africa. It is even more strongly felt among the native races owing to the local concentration of their interests. The American negro manifests it also, and in the United States black districts tend to become blacker both in town and country.

To deal with this position the Union Government last year passed the Natives Land Act (No. 27 of 1913). It provides (1) that, except with the approval of the Governor-General, no land or rights in land shall pass from natives to whites, or *vice versa*, until Parliament shall have made provision for such transfer in suitable cases; and (2) that the Governor-General shall appoint a Commission to enquire and report as to the areas within which native and white occupation should respectively be forbidden. This Commission is now at work and its report is awaited with interest. Power is also given by this Act to the Governor-General to purchase land or interests therein for the purpose of establishing any new white or native area, and a schedule contains a list of the areas within the Union now set apart for native occupation.

This Act has not met with universal approval either from whites or natives, and the general basis of the criticism it has met with may be summed up by saying that the value of the Act must altogether depend upon the wisdom with which it will be administered, and both races have doubts on this point. This practical question is now before the country, and obviously it can only be worked out in detail and on the spot wherever native and white lands are intermingled.

The other practical issue which demands consideration is the policy to be followed with regard to locations. Should the native be encouraged to remain in his reserves with his family and thence come out to work, or should he be encouraged to migrate with his family to locations reserved for him in the neighbourhood of white centres of employment?

In favour of the locations it is pointed out that if resident there he will become a more permanent and reliable factor in the labour market, being wholly dependent on his wages for a livelihood. A considerable number of natives at the present time are also themselves in favour of locations, saying that as they have lost their cattle their home is at their work and they would wish to live near it. (*See* Economic Commission Report, paragraph 52.) It is also alleged in this connection that native reserves may become a menace to the surrounding white populations.

On the latter argument little importance need be placed. Secure the native in his reserves, and thereby give him a definite stake in the country, and he will not be likely to jeopardise his position, especially as, owing to the outside demand for their labour, they are at all times secure against starvation.

With regard to native reserves it must also be remembered that in certain cases, the most important of which are Basutoland and Pondoland, the rights of the Crown are limited to the rights which the natives themselves have voluntarily granted. So recently as 1894 the Pondos, until then an independent tribe, agreed to be ruled by the Colonial Government, and the Basutos, after successfully defending themselves in 1880–1881 against the attempt of the Cape Colony to disarm them, petitioned the Imperial Government in 1884 to administer their country.

As a result of the natural causes alluded to, in all probability locations will increase in size and importance, and perhaps the native population will increasingly desire to free itself from tribal restraint, but the advantages of the reserve must not be forgotten. On this point a quotation may be given from a paper read by me before the British Association in 1905:—

> "In the location he" (the native) "is more closely huddled together than he would be in his own country and finds the only work to his hand is more strenuous and more exacting than that to which he is accustomed. He also finds himself in surroundings among which his native customs have no place, and is compelled to purchase from the white man the food which in his own country he and his family grew with their own hands. What the white man gains, therefore, is little more than the labour required to pay for the food which under reserve conditions the natives themselves produce. . . . In a reserve the native lives under conditions which he understands and has created for himself. Look forward a few years. For a time the location consists of able-bodied people, but they grow older; they become ill; they become disabled; who is to support them? They commit offences, who is to control them? The reserve is a sanatorium where they can recruit: if they are disabled they remain there. Their own tribal system keeps them under discipline, and if they become criminals there is not the slightest difficulty in bringing them to justice. All this absolutely without expense to the white community. . . . As time goes on these location burdens will increase and the proportion of persons in the locations really able to work will still further diminish. The number of actual workers, taking the less healthy location conditions into account, will therefore be absolutely less than in a population of equal numbers in a reserve. . . . As the native in a location will have to support his family, it means that his wages will have to be sufficient to support them in addition to the worker. If this family lived in a reserve they would all take part in the growing of their own food, so it can hardly be supposed that location conditions will lead to a reduction in native wages. . . . Again, the field work in the reserves is mainly performed by the women and children. In locations what work can they find to take the place of this, and how can we expect them to be equally healthy under location conditions?"

Here, then, is a case in which tendencies should be carefully watched, and for the supplying of suitably regulated locations as they are required. This would appear to be a far wiser policy than perhaps to bring about a violent disturbance of native life by bringing pressure to bear to induce them to leave their reserves for locations.

It must be remembered that these races have become part of our present South African social system upon a basis fixed for them by us, and for which their own social system provides no precedent. The assumption, that because some particular line of action appears

to us logical or advisable it will also similarly appeal to the native mind, is therefore quite unsafe.

Three conclusions of my British Association paper may perhaps be quoted:—

"(1) That the differences between the native social system and our own are so great that the two can never form parts of one social organism any more than that the races can amalgamate.

"(2) That the task before us is that of regulating native custom and encouraging all tendencies we know to be sound, as they manifest themselves.

"(3) That in a wise extension of the reserve system lies by far the most hopeful field for native development."

HOWARD PIM.

Johannesburg,

APPENDIX VIII.

STATEMENT HANDED IN BY MR. R. W. SCHUMACHER WITH REFERENCE TO THE AMOUNT OF MONEY TAKEN HOME BY THE NATIVES AFTER HAVING WORKED OUT THEIR PERIODS OF ENGAGEMENT ON THE MINES OF THE WITWATERSRAND.

(*See* Question 2330A, p. 87.)

Various estimates have been made, but all are very unreliable, and the following extract from the evidence given by the Director of Native Labour before Mr. Buckle, the Chief Magistrate of Johannesburg, who was appointed to act as a Commissioner to enquire into native grievances, will best show the difficulty of arriving at any reliable information on the subject:—

"(*The Director of Native Labour.*) Too large a proportion of native earnings are spent here on the Rand, and it is better from every point of view that as much money as possible should be spent in the area from which they are recruited.

"This matter has a very important bearing on the labour question generally. When I have addressed meetings in the Native Territories, the older natives, those who are dependent largely upon the earnings of the younger men, have invariably remonstrated with me as regards temptations placed in the way of natives to squander their earnings and get into debt; that, before they return home, they are required to pay those debts, with the result they go back with the proverbial concertina. That is the native way of putting the position to one. Things are not quite as bad as that. I estimate that about 12*l.* is taken away by a native who has worked, we will say, nine tickets; but, still, too large a proportion of their earnings is expended here, and largely on trash.

"I have got a schedule here from you about that (S. A. M. P. 20). Do you know how this has been arrived at?—It has been arrived at by consulting the inspectorate, who were asked to take the advice of any people with experience of native labour on the Rand, people such as compound managers, Marwick and Morris, &c.

"It is very largely a matter of opinion, is it not?—Very largely. It must necessarily be so. The natives, in the first place, either take their money home themselves when they go home, and they are peculiarly secretive as to how much they have on their persons, or they send it by their friends, and, again, the news of how much is going by their friends naturally does not travel very far, as it is sent through a remittance agency.

"There are enormous differences here in the estimates. One, for instance, puts the average balance taken home, Johannesburg East, after 180 shifts as 3*l.* 10*s.* A little further down you will get 9*l.* He is referring to an East Coast native particularly.

"I take it, all these below are East Coast also, and they run up to 6*l.*, 7*l.*, and 8*l.* Why they should take 11*l.* 12*s.* from Johannesburg West and only 3*l.* 10*s.* from Johannesburg East does not seem clear.

"The difference of opinion is as to how much they spend on luxuries. Johannesburg West thinks they spend 3*l.*, Johannesburg East thinks they spend 10*l.*?—Yes."

Evidence was also given before Mr. Buckle by Mr. H. M. Taberer, the General Superintendent of the Native Recruiting Corporation, as follows:—

"(*The Commissioner.*) Have you any means of forming an estimate of what becomes of the native's wages up here; how much he spends whilst he is here, and how much he generally takes home?—No, sir. From general observation when travelling round I know that it varies enormously. I have had storekeepers on the Rand come to me and beg me (more than beg, sometimes) to alter the distribution of natives on the mines, because they say the Pondo will spend nothing, and takes 80 or 90 per cent. of his earnings to his home. The Shangaan spends 75 per cent. of his wages. The Pondo and the Fingo look after their money very carefully. The Zulu is fairly careful. The Shangaan and the Natal boy will spend almost everything.

"Who are the Natal boys?—I am afraid I have been accustomed to treat them differently from the Zulus. The traits of the Natal boys are different from the Zulu.

"You are distinguishing between the Zulu of Zululand, and the Zulu in Natal?—Yes. The Zulu of Zululand is not so extravagant as the Zulu boy of Natal. A great deal depends on his position in the family. In Zululand the patriarchal system continues. In Natal they have been cut up and individualism has asserted itself. In Pondoland the chiefs have more influence with their people, and where that is so, it is reflected on the members of the family, and for that reason the Pondo is dutiful towards his family, which he respects. The Pondo is the one native who looks after his money.

"What is the characteristic of the Xosa?—He likes to spend his money. I should say that he does not take more than 30 per cent. home. That is, however, a guess.

"He, of course, has been in touch with civilization a much longer time than the Pondo.

"They are situated west of the Pondos?—Yes.

"Can you trace the causes of their financial habits to any particular rule. Can one say particularly that those natives who come most into contact with civilization have the most extravagant habits, or would that not be a correct summary?—I would not care to say it was extravagance. What would be a luxury to a Pondo might be a necessity to a Xosa.

"Are the natives who are longest in touch with civilization the freest spenders, and the further you go back to the primitive savage, is it the case the more careful you find they are?—Yes, generally.

"How do you reconcile that with the Shangaan. I thought he was the most backward of the lot?—That is, speaking generally. Take the Fingo, who has been the longest among Europeans, he is the Jew of the natives. He is most careful with his money, and if he lends you 1*l.*, he wants 2*l.* for it in four days.

"Did they split off from the Basutos?—Yes. A lower section of the Basuto tribe.

"Has the Basuto got the same characteristics?—He is careful of his money, much more so than the Xosa. It may be that he is very nearly as careful as the Fingo.

"The amount of money which is taken by the native, as compared with the amount which he spends on the spot here, is extremely large, and there exists no means of estimating it at all, even approximately?—The closest way you would get at it is by examination of remittances made by natives through the Post Office and Native Affairs remittance and ourselves, and getting the turnover from the stores alongside the mines; that would give it to you approximately.

"I understand that these remittance agencies handle only a small proportion of the total pay, but that the native practice is to give it to their friends going home?—Yes. It is more generally conveyed in specie than through a remittance agency.

"What do you consider the necessary expenses of the native up here. Take the 180 shifts boy—that is the engagement you make with him. During that time all the necessaries are supplied, but he has to supply himself with a certain amount of clothes?—Very little. He supplies himself with an outfit before he leaves. He gets a pair of boots, trousers, and, perhaps, a shirt.

"What is the cost of that outfit?—25*s.* to 30*s.*

"Wear and tear of clothes in mine work is very great?—Yes. I do not know what price mine trousers would cost, I should think 4*s.* or 5*s.*

"Apart from clothes, I cannot think of anything else in the way of necessaries?—No, there is nothing absolutely necessary. I think the climate necessitates him providing himself with a blanket, especially in the winter time, and if he is working on the surface he wants a coat. Then, of course, the native likes to return a little better provided for than when he left. He generally fits himself out with a new suit.

"That he does at the last moment?—He takes it home new.

"He would be wearing that suit for a good many months at his kraal?—Naturally.

"I was thinking of the native's expenses; that is, in fact, a saving?—Yes.

"The average rate on the mines is about 2*s.* per shift?—The last computation was 1*s.* 11·7*d.*, I think.

"So that the 180 shift boy would earn 17*l.* or so?—Yes.

"He probably started 5*l.* in debt; his railway fare, food, &c. would come to about 25*s.* to 30*s.*, that would leave him 11*l.* 10*s.*; if he spent 2*l.* in clothes here, that would leave him 8*l.* 10*s.*

"How long does he take to work his 180 shifts—eight months?—Yes, under eight months.

"He would spend about 10*s.* per month on luxuries and he would only be likely to take home 4*l.* with him?—That is if he spends any of it up here.

"As far as I can see, he is hardly likely to take more than 5*l.* or so home?—Lots of them do. Some of them don't spend anything. If the Pondo spends 5*s.* or 10*s.* during the whole of his six months' contract, the storekeepers consider him to be a spendthrift. He takes home practically everything that he earns. This information I get from the storekeepers, who are persistent in their endeavours to get me to alter things."

APPENDIX IX.

MEMORANDUM FROM THE WITWATERSRAND NATIVE LABOUR ASSOCIATION, LTD., REGARDING THE AMOUNT OF MONEY TAKEN HOME BY EAST COAST NATIVES AFTER THEIR PERIOD OF SERVICE ON THE WITWATERSRAND.

(*Put in by Mr. R. W. Schumacher, see q.* 2330A, *p.* 87.)

It is a most difficult matter to arrive, with any degree of accuracy, at the average amount of money taken home by a Portuguese native after completing his period of service on the Witwatersrand, as, naturally, the native is very unwilling to furnish any details as to his savings.

(1). In 1906, the Witwatersrand Native Labour Association, Limited, working on the basis of the value of kaffir truck and Portuguese native wine imported into the Province of Mozambique, plus the amount of hut-taxes paid, arrived at the conclusion that natives took back between 30*l.* and 35*l.* per head. These figures, however, were unsatisfactory in that no allowance was made—

(1) For wages earned within the Province of Mozambique.

(2) For the amount of goods purchased in kind, *i.e.*, with mealies, mandioca, and other local produce.

(2). In 1909, Mr. B. G. Lloyd, the present General Manager of the Witwatersrand Native Labour Association, and then the Association's District Manager at Lourenço Marques, in giving evidence before the Liquor Commission, stated that the amount brought back by returning natives was, in his opinion, about 40*l.* per head, and the basis of this calculation was the same as in the previous case.

(3). The only other method of determining the amount carried back is by examination, and cross-questioning all returning natives. This course has been adopted both by the Association's officials, and by the Portuguese Authorities in the Province of Mazambique. The conclusions arrived at must, however, be taken with a very large amount of reserve, as a native, when questioned, is not only chary of stating what amount of money he has on his person, but also looks at the question from a different point of view from that of a European. For instance, a native may possibly be taking back a total amount of 20*l.*, and in reply to enquiries will advise his questioner that he is only in possession of 8*l.* In this reply he considers he is quite truthful as the balance of 12*l.* has already been allotted by him for particular purposes, such as purchase money of a wife, hut taxes, debts, &c., and will not be counted by him as part of his savings.

In 1909, the Association's officials at Johannesburg carefully examined a gang of 1,600 East Coast repatriates as to the amount of their savings, and the result gave an average of 8*l.* per head. At a little later date, a gang of some 1,500 natives were dealt with in the same way, and the result gave a total of 13*l.* per head.

In January, 1910, Dr. Pinto Coelho, the Intendente of Emigration for the Province of Mozambique, stated that, as a result of experiments made by the Emigration Authorities at Ressano Garcia, it was found that returning natives brought back with them an average amount of 20*l.*, or, roughly, 800,000*l.* annually. The Intendente added, however, that in the calculations, money crossing the border by other channels than through Ressano Garcia had not been taken into account.

(4). Kaffir storekeepers on the Rand admit generally that the Portuguese native spends on an average, say, 20*s.* per month. His average wages are in the neighbourhood of 55*s.* per month, and his average period of stay on the Witwatersrand is 18 months. From the above figures it would appear that the amount saved and taken back in one way and another must be in the neighbourhood of 30*l.*

It will be noticed that this figure corresponds very closely with the figure arrived at by the Association in 1906.

Johannesbury, 8th April, 1914.

APPENDIX X.

LETTER (WITH ENCLOSURE) FROM MR. R. W. SCHUMACHER ON THE SUBJECT OF THE INCREASE OF TEMPERATURE WITH DEPTH IN THE WITWATERSRAND MINES.

Johannesburg, Transvaal,
9th April, 1914.

DEAR SIR EDGAR,

Increase of Temperature in Depth.—It occurred to me afterwards that my reply* to you on this subject was not as comprehensive as it should have been. The increase in temperature of 1° F. for every 254 feet vertical depth refers to rock temperatures on these fields. The point is that by a proper system of ventilation the air temperature may be kept well below the temperature of the rock. I am sending you herewith memorandum on the subject of to-day's date by our Consulting Engineer, Mr. H. S. Martin, together with a number of enclosures which deal with the subject very thoroughly. Perhaps you will be kind enough to regard these papers and this letter as an appendix to the statement* which I handed to the Commission on the 4th instant. There can be little doubt that with a good system of artificial ventilation mining can be continued on these fields to quite unprecedented depths.

Believe me,
Yours, &c.,
R. W. SCHUMACHER

Sir Edgar Vincent, K.C.M.G.,
Chairman, Dominions Royal Commission.

* See q. 2342, p. 88.

* Printed on pp. 82-84.

The Corner House,
Johannesburg,
9th April, 1914.

Dear Sir,

Rock Temperatures and Mine Air Temperatures.

A good deal of reliable information is recorded dealing with this subject, and several papers have been written.

The most up-to-date and reliable information, I think, is to be found in the attached paper* by Messrs. James Whitehouse and W. L. Wotherspoon, published in the Journal of the Chemical, Metallurgical, and Mining Society of South Africa for May, 1911. This paper was the outcome of information I was compiling to compare the Village Deep Mine health conditions prior to the running of the mechanical ventilator with the improved health conditions after the fan was running. Great care was taken at the time in getting accurate information, and I am sure you will with great interest read the paper.

The more recent observations in the Witwatersrand area indicate that the estimated rate of mean temperature rise is now represented to be 1° F. for 254 feet vertical depth, the temperature of the rock varying from 65° F. at 200 feet to an estimated temperature of 98° F. at 7,000 feet depth, whereas former results indicated 1° F. for 208 feet vertical depth.

The most recent rock temperatures I have in my possession were taken last year for the purpose of the Rand Mines Statistics Book, and are shown on the attached blue print.* These figures indicate the rise in temperature to be 1° F. for 268 feet.

The attached table* shows the mine air temperature in the Village Deep Mine, taken in February of this year.

The temperature of the air in a downcast shaft varies considerably from mid-day to the early hours of the morning. This variation is felt for some distance along the main intake airways in the mine and at considerably below the rock temperature. However, as the air traverses the mine workings the temperature increases. The amount of increase depends upon the quantity of air circulated and the rapidity with which the mine air is changed. The air contained in the workings of mines is being continuously deteriorated by the processes of breathing, combustion of lamps and candles, the oxidation of organic and mineral substances and blasting, and for this reason requires to be continuously renewed, and calls for the introduction of a liberal and continuous supply of fresh air.

The Village Deep figures show that at the bottom of the Turf Shaft the rock temperature is 82° F. at a depth of 4,000 feet. The air temperature at the shaft bottom and along the 16th level, and a few hundred feet from the shaft bottom, is 70° to 71° F., and after the air has circulated the mine workings the temperature at the foot of the upcast shaft, the end of the main return, is only 72° F. Higher temperatures are recorded up to 87° F.—5 degrees higher than the rock temperature. This is due to the air not being changed often enough in these places, these temperatures being taken in dead ends of drives where the main current cannot sweep and the ventilation depends almost entirely upon the exhaust air of the machines or open cock from the compressed air mains.

Sluggish ventilation in deep mines must result in air temperature exceeding rock temperature; on the other hand, with abundance of ventilation and good currents of air throughout, the air temperature can be kept 5° to 10° F. below rock temperature.

It is important to consider the quantity of moisture the air contains, for that decides the temperature at which men cease to work efficiently. We want large volumes of air circulating at a good velocity, and as free from moisture as possible.

The highest temperature at which work was carried on in the St. Gothard tunnel was 90° F., and this was considered to constitute the limit for men.

It is difficult to carry on work in air saturated with water vapour at 77° F., although men can bear a temperature much higher in dry air. Under high temperature conditions, where the air is saturated with moisture, the hours of shift would probably have to be cut down by 50 per cent.

Before the mines of the Rand will be able to work to any extent at depths of 6,000 to 7,000 feet some means of artificially cooling the air may have to be devised, and undoubtedly the mine workings will have to be so arranged that full advantage of the ventilation can be obtained. At present, even on the best ventilated mine on these fields, only 50 per cent. of the air circulated is doing useful work, owing to it filtering through large worked-out areas which cannot be closed off altogether.

Yours faithfully,
Hy. Stuart Martin,
Consulting Engineer,
Rand Mines, Ltd.

R. W. Schumacher, Esq.,
Johannesburg.

APPENDIX XI.

Memorandum furnished by Mr. R. W. Schumacher on Trading Stands on Mining Properties in the Transvaal.

(*For Mr. Schumacher's oral evidence, see p. 82 et seq.*)

This memorandum is divided into two sections.

Section 1 deals with the position of stands prior to the passing of the Act now in force—Act 13, 1910.

Section 2 sets forth the position under the existing Act.

Section 1.

Prior to the Gold Law of 1898, any person was entitled to apply for a stand on ground held under *Mining or other Title*, but under that Law (No. 15 of 1898) trading on *mining ground, i.e.*, ground held under Mijnpacht of Claim Licences, was prohibited.

Provided licences (which are either at the rate of 7*s.* 6*d.* or 11*s.* 3*d.* per month, according to the size of the stand) are paid regularly on these stands, trading can be continued indefinitely unless any regulations governing trading on mining areas are contravened. Stands still exist which were created under this Law.

In 1905 it was recognised that a certain amount of trading was being conducted on sites which were not legally set aside.

A Board was constituted under Act 35, 1905, Section 14, which permitted of the continuance of such trading until 31st December, 1906. It is understood that some 35 traders were affected.

In 1907 an Ordinance (No. 35, 1907) was passed amending Act 35, 1905. Section 14 of the 1905 Act was repealed and an opportunity given to the 35 persons dispossessed under the 1905 Act to obtain trading sites.

Under Sections 78–80 of Act 35 of 1908 (Gold Law), and which are still of force, any white person is at liberty to apply to the Mining Commissioner for a dwelling or business stand on *open proclaimed land*. The licences payable thereon range from 11*s.* 3*d.* to 21*s.* per month, according to the size of the stand, the freehold owner of the ground on which such stand is situate receiving one-half of the licence moneys.

Under Section 82 of the 1908 Gold Law trading on mining ground was forbidden, except—

(*a*) On stands acquired under Law No. 15 of 1898 (Gold Law) or a prior law previously referred to.

(*b*) On stands set aside by the Government Trading Board under Sections 77, 83, and 84 of the 1908 Act.

As regards (*a*), the freehold owner of private land on which a stand is situate receives three-fourths of the stand licences paid to the Mining Commissioner.

As regards (*b*), *the Trading Board appointed in terms of* 1905 *Gold Law was empowered to select stands on mining ground*, provided the ground so selected was not required by the holder of the Mining Title for mining or purposes incidental thereto. The Board then had the right to call for applications for the stands so set aside, and to issue trading certificates to approved applicants. These certificates held good up to the 31st December of the year in which they were granted. At the present time no further stands

are created under this law, but the trading certificates granted hereunder still exist. These certificates are renewable by the holders thereof on the 1st of January in each successive year, provided application is made to the Government each year and receives its approval; the Trading Board only has the right to refuse such applications if the conditions of grant have been contravened by the holder of a certificate. Transfers of certificates from one party to another are also subject to the approval of the Board.

The rent of trading stands varies from 11*s.* 3*d.* to 21*s.* per month, according to the size of the stand, and the freehold owner of the ground on which a stand is situate receives one-half of such rental.

In addition to the above Stand Licence the holder of a certificate pays to the Government an annual rental which is at present based on 3 per cent. per annum of takings up to 3,000*l.*; 3½ per cent. from 3,000*l.* to 6,000*l.*; and 4 per cent. on 6,000*l.* and over, but the freehold owner of the ground does not receive any share of these proceeds.

Section II.

Under Act No. 13 of 1910 (Transvaal), the Trading Board created in 1908 was abolished. Trading stands which then existed were registered in the name of the Mining Commissioner of the mining district concerned instead of in the Board's name.

Section 82–87 of the 1908 Gold Law were repealed to the extent that the Board was abolished and its functions transferred to the Mining Commissioners and a new method of allotment prescribed.

No person is now entitled to trade on, or have an interest in, more than one trading stand or site, and the Mining Commissioner is empowered to cancel certificates when of the opinion that too many stands exist in any particular neighbourhood.

Where the Minister of Mines is of opinion that further trading stands are desirable in any mining district, the Mining Commissioner is empowered to choose further sites on mining ground (not required for mining or purposes incidental thereto) each in extent 100 feet square, and not less than 600 feet from the entrance of any mining compound. The right to trade on these sites is then available for sale by public auction by the Mining Commissioner, the purchase price being an *annual* sum, from the first of which payments the Government deducts the costs of the sale. The only instance connected with companies of this group is the Modderfontein B Gold Mines, Limited, on whose property a stand was set aside and the right to trade thereon sold by auction in 1912 for an annual rental of 2,005*l.* The lessee, however, could not continue to pay this high rent, so his licence was cancelled, and the stand was resold by public auction by the Government at a rental of 110*l.* per annum for a period of 10 years from the date of sale.

The freehold owner of the ground is entitled to half of the ground rent, which varies, according to the size of the stand, from 11*s.* 3*d.* to 21*s.* per month, but does not participate in any other sums received by the Government.

When a trading stand or site, after having been selected, is required for mining or purposes incidental thereto, the Mining Commissioner is authorised to set aside another site on ground not so required.

In all other respects the Mining Commissioner has practically the same powers as were delegated to the Trading Board under the 1908 Ordinance.

The Schedule attached marked "A"* gives a list of the trading stands set aside by the Government under the 1908 Gold Law on the companies of the Central Mining and Rand Mines Group, together with stand licences and the rentals payable by the holders of the certificates in respect thereof to the Government during the current year, and also shows the rentals paid previously.

In addition, particulars* of the aforementioned stand on the Modderfontein B Gold Mines, Limited, sold by public auction under Act 13 of 1910, are also given.

From Section 85 (2) of Act 35, 1908, it will be seen that sites created as trading stands had to be registered in the name of the Board (amended subsequently by Law 13, 1910, to the Mining Commissioner of the district concerned). The dominium does not pass from this official.

The individual's right to trade is constituted by a lease, terminable on a fixed date, but shall continue during the period that the lessee holds a certificate to trade.

Transfer of certificate cannot take place without the sanction of the Mining Commissioner.

At the termination of the lease the stand let and all buildings thereon revert to the Crown, the only compensation payable being prescribed in Section 90, sub-section (*d*) of Act 35, 1908, which is as follows:—

"That the holder shall take over from any previous holder any buildings erected on the trading stand on such terms as the Board may prescribe."

As the duration of the lease is definite and as the basis of compensation to be paid when the lease terminates is fixed, it does not appear that any vested right has been created, but the Mining Commissioner of Johannesburg will be able probably to give definite information on this point.

In the instance of sites sold by auction the duration of the right to trade is fixed in the conditions of sale.

In the case of the Modderfontein B Gold Mines, Limited, and, we understand, some sites on neighbouring properties, the period has been fixed at 10 years.

A further Schedule is attached marked "B"* showing the mining stands registered in the names of certain of our companies. These were created prior to the 1898 Gold Law, and the Schedule shows *inter alia* the rentals at which they are leased for trading purposes.

* Not reprinted.

APPENDIX XII.

LETTER FROM MR. G. NATHAN, OF JOHANNESBURG, SUPPLEMENTING HIS ORAL EVIDENCE ON THE SUBJECT OF AN AMALGAMATION OF THE GOLD MINES OF THE WITWATERSRAND.

(*See Question* 2619, *p.* 102.)

P.O. Box 1242,
Johannesburg, South Africa,
16th April, 1914.

GENTLEMEN,

IN supplementing my statement to your Commission of the 6th inst. (permission to do which you kindly granted me), I may perhaps be allowed to refer to the evidence given before you on the subject of competition for native labour. In this connection it was submitted to you that, in consequence of the formation of the Native Recruiting Corporation, competition for natives had ceased, and, since there was no reason to assume that under proper management the Native Recruiting Corporation should not continue indefinitely, it was not likely that a state of competition would again come into existence. This is a view which I cannot share. It is quite true that, for the time being, recruiting fees have been limited, but this does not eliminate competition to secure the services of the natives, which, I maintain, still prevails all over the Rand. Owing to the fact that the Robinson Group, with an official complement of over 30,000 natives, is not a member of the Native Recruiting Corporation, and is therefore at liberty to compete (as it does) with that Corporation, the ring is not even complete so far as the different mining groups constituting the Native Recruiting Corporation are concerned. This, however, is not such a serious objection as is the fact that the Native Recruiting Corporation is not in a position to send natives to any mine which at the moment may be most in need of them. The native is free to select the particular property to which he shall be allotted, and, in order to influence his choice in this connection, most of the companies vie with one another to secure his favour by granting him what they think are smaller or larger advantages while he is working for them. These mainly consist of such privileges as the right to "loaf" at certain times during the week, extra rations of meat, the opportunity of selecting the task to be performed, gratuities paid which do not appear in the native pay rolls, and so on; which all—without considering the waste of money involved—lead to laxity and ineffi-

ciency. In this regard I may state that the system of piecework for shovelling and tramming, introduced about a year ago, shows no proper relation between rates of pay and task when compared with day's pay, and it may, therefore, be said to have been inaugurated simply to popularise certain mines in the eyes of the native worker. Consequently, I maintain that internal competition still exists, to the detriment of the industry, and that this element cannot be done away with so long as there are individual mines and individual groups. Moreover, the permanency of the Native Recruiting Corporation is by no means assured. As a matter of fact, even now there seems to be an inclination on the part of one of the groups to break away from it, and although this may not happen at the moment, the danger is always with us that one day the Corporation will be disrupted, and that full competition, with all its drawbacks, will recommence on these fields.

It has also been stated in evidence before you that all the advantages to be gained by a general amalgamation are equally attainable without. This is much easier said than proved, inasmuch as the defects of the present single-company individual-group control must be apparent to everybody concerned with the administration of the mines. Nevertheless, an improvement has not been effected, and it seem to me too much to assume that now, all of a sudden, a betterment can be brought about under prevailing conditions. It has been due to the many different heads and to the lack of *esprit de corps* that the administration of the industry in the past has not been what it ought to be, and I submit that so long as the many heads continue the same lack of *esprit de corps* will persist, and no improvement will be manifested in this respect. To illustrate how extremely difficult it is under the present system of control to arrive at any common policy, I may mention that, after it had been found that the wages paid to natives employed on machine drilling were not sufficiently attractive as compared with the hand drilling or hammer work rates, the matter of making the necessary adjustment of the rates was under discussion from November, 1912, until February, 1914, and it was not until the latter month that new rates of pay were agreed upon by the employers. Thus, a matter which could, and should, have been decided within a comparatively short time took fifteen months to settle, and during this period the industry had to suffer all the disadvantages arising from the disinclination of the natives to undertake machine work at the prevailing rates.

I hardly think it is necessary for me to further deal with the shortcomings of the existing system of administration, and I will, therefore, now proceed to show what, in my opinion, a general amalgamation would mean in figures. I must, of course, assume that the capital necessary to lay out the workings of the Witwatersrand on a basis which would conduce to the attainment of the greatest economy would be forthcoming, and I think that the following savings would then become possible:—

(1) Development could be reduced to below half of what is done to-day, and a proportionate reduction in working costs would result. This I will put down at the low figure of 6*d*. per ton milled.
(2) The supporting of the hanging-wall, which is at present done by rock-walling and timbering, could be effected by a proper system of sand-filling which, at the same time, by enabling a better control of the air currents, would greatly improve the ventilation of the workings, and bring about a saving of, say, 6*d*. per ton.
(3) Tramming and shovelling, 6*d*. per ton milled.
(4) Pumping, 4½*d*. per ton.
(5) Winding and shaft maintenance. It is extremely difficult to say what is now actually spent on these items, but the outlay is certainly considerable, and it is not too much to assume that under this heading a further 3*d*. per ton crushed would be saved
(6) Surface transport, 1½*d*. per ton.
(7) Reduction costs, 1*s*. per ton.
(8) Workshops, 4½*d*. per ton.
(9) General expenses. I will put the saving under this head at the low figure of 3*d*. per ton.
(10) Head office, 1½*d*. per ton.

Adding these together, we arrive at a total saving of 4*s*. per ton milled as the result of concentration only. To this has to be added the equivalent for the largely increased efficiency of the individual worker which undoubtedly would be brought about, and which I do not think I over-estimate at a further 2*s*. per ton, so that a reduction in the working costs by 6*s*. per ton milled could be expected, without taking into account the considerable amount which would be saved in consequence of the abolition of the recruiting of native labour. On the rock crushed during 1913, viz., 25,600,000 tons, this 6*s*. per ton alone would represent a saving of over 7,500,000*l*.; in other words, the amount of profit available for distribution would have been almost doubled. Apart from this feature, however, the working costs would be so reduced (in 1913 they were 17*s*. 11*d*. per ton, which, less 6*s*., leaves 11*s*. 11*d*.) that practically every ton of ore on the Main Reef series could be mined, with the natural consequence that the duration of the period of mining on these fields would be indefinitely prolonged, and the enormous expansion of which I spoke in my statement of the 6th inst. would be consummated, to the great benefit of the community of South Africa.

I must especially point out, however, that to bring about the alteration in the system of working required to effect the above-mentioned economies would take several years from the date of amalgamation, and that the benefits could not, therefore, be expected to follow immediately. On the other hand, it is hardly necessary to again draw attention to the immense waste that must persist if amalgamation be further delayed —this being clearly demonstrated by the foregoing figures. It must also be borne in mind that the continuation of the present system makes the inauguration of a common policy for working the Witwatersrand as a whole more difficult of accomplishment with the passing of each year.

I have, &c.,
G. NATHAN.

The Chairman and Members of the
Dominions Royal Commission,
London, England.

APPENDIX XIII.

CORRESPONDENCE AS TO THE PROPORTION OF THE REVENUE OF THE UNION WHICH IS DERIVED FROM THE MINING INDUSTRIES OF SOUTH AFRICA

(*See* pp. 7 and 45.)

1. *Letter from Mr. J. R. Leisk, Secretary for Finance.*

Union of South Africa,
The Treasury, Cape Town,
SIR, 9th April, 1914.

I HAVE the honour to advert to our discussion this morning on the subject of the proportion of the Union's revenue which may fairly be said to be attributable to the various mining industries of the country.

In terms of a request preferred by you, I asked the various revenue-earning departments to frame returns, to the best of their abilities, of the revenues administered by them which, indirectly as well as directly, might reasonably be deemed to accrue from mining gold, diamonds, coal, and other minerals within the Union. A summary* of these returns is in your possession, from which you will have perceived that 45 per cent. of the Union's revenues are attributed to mining and 55 per cent. to other sources.

It will, of course, be manifest to you that the preparation of estimates of this nature is a most difficult matter and that the figures are necessarily very arbitrary. For this reason, the summary now before you requires to be examined with the greatest care before any reliable conclusions can be drawn therefrom.

I am satisfied in my own mind, although I am unable to prove my conviction, that the figures given in the summary are considerably below the mark as regards the proportion of our revenues attributable to mining. If it were assumed, for the sake of argument, that mining operations were altogether suspended throughout the Union, then there can be no doubt whatever, in my opinion, that the sources

See next page.

other than mining could not contribute 15,000,000*l.* by way of revenue to the State. All the other industries of the Union, not excluding agriculture, are so intimately concerned in the welfare and prosperity of the mines that their powers of contributing to the national exchequer would be sadly impaired by the disappearance of this mainstay. This is a factor to which the revenue officers, in preparing their estimates, could not be expected to give full credit, but it is nevertheless one that, for your purposes, cannot be ignored.

My deliberate opinion, arrived at after looking at the matter from all points of view, is that it would not by any means be an exaggeration to regard 60 per cent. of the Union's revenues as being directly and indirectly attributable to our mining industries, leaving only 40 per cent. as the yield from other sources.

I have, &c.,
JAMES R. LEISK,
Secretary for Finance.

Sir EDGAR VINCENT, K.C.M.G.,
Dominions Royal Commission,
Cape Town.

---

2. *Summary estimate referred to in Mr. Leisk's letter.*

ESTIMATE OF REVENUE OF UNION IN 1913-4 DIRECTLY TRACEABLE TO MINES AND MINING POPULATION (INCLUDING GOLD, DIAMONDS, AND COAL).

(The Estimates omit consequential revenue, poll tax on natives, &c., and taxes paid by whites outside the mining centres, who profit by the mining industry, *e.g.*, merchant firms at the coast).

	In Thousand £		
	Mines.	Other Sources.	Total.
Customs and Excise	1,900	3,400	5,300
Posts, Telegraphs, &c.	463	1,217	1,680
Inland Revenue :—			
Mining Taxes and Royalties ..	2,380	—	2,380
Stamps and Licences	380	680	1,060
Estate and Transfer Duty ..	280	190	470
Pass Fees	350	60	410
Native Taxes	—	790	790
Land Revenue, Rents, &c. ..	—	340	340
Miscellaneous	200	820	1,020
	5,953	7,497	13,450
Railways and Subsidiary Services ..	6,320	6,920	13,240
Harbours	250	760	1,010
	12,523	15,177	27,700

Say 45 per cent. from mines, 55 per cent. from other sources.

3. *Extract from letter from the Transvaal Chamber of Mines.*

Johannesburg,
9th April, 1914.

SIR,

* * * * * *

PROPORTION OF REVENUE OF UNION DERIVED FROM MINING INDUSTRY.

I have considered the estimate* of the revenue of the Union directly traceable to mines and mining population handed to me by the Chairman, and would make the following remarks:—

(*a*) *Customs and Excise.* The division of this revenue between mines and other sources has, I understand, been made on a population basis. I would point out that such a basis must considerably under-estimate the mines' share, as the average spending power of the mining community per head is, without doubt, considerably higher than the corresponding spending power of the remainder of the population.

(*b*) *Native Taxes.* It appears to me that a portion of the native taxes may legitimately be credited to the mines.

(*c*) As stated in the estimate, consequential revenue, and revenue derived from that portion of the white population, which, although not classified under "mining population," yet lives largely through profits derived from the mining industry, have not been credited in any way to the industry. Such revenue must amount to a considerable sum.

Generally, therefore, it appears to me that the estimate considerably under-estimates the share of the revenue of the Union which is ultimately borne by the mines.

I have, &c.,
W. GEMMILL,
Acting Secretary.

THE SECRETARY,
Dominions Royal Commission,
New Law Courts,
Johannesburg.

---

* *See* (2) above.

APPENDIX XIV.

MEMORANDUM BY MR. W. LORIMER ON A VISIT TO THE WORKS OF THE ALLUVIAL TIN FIELDS OF AFRICA ON MARCH 10TH, 1914.

Tin is a metal which has not yet been largely produced in South Africa. Much the largest quantity has hitherto been found in the Transvaal, but here and there mines are being worked in the Cape Province which give promise of increased production. The works of this company are situated about 15 miles from Cape Town in a very extensive area of a similar geological character, but although numerous bores have from time to time been made not much success has resulted. The Alluvial Company's mine has, however, a good promise, and yields 4 to 5 lbs. of black oxide for each cubic yard handled. The deposit is a gravelly clay, and the embankment on which operations are at present carried on is worked by pick and shovel with occasional blasting to provide material enough to keep the operations running night and day. The process employed is of a simple description. The material dislodged is sluiced to a water box, where the gravel, clay, &c., are removed and thrown aside as worthless. The remainder is again sluiced to another water box and kept in constant motion by hand until all the valueless material is washed away, leaving only the tin concentrates. These contain 76 per cent. of pure tin, are put into bags containing 100 lbs. each, and shipped in this form to Swansea. The present output is about 10 tons of concentrates per month, but it is expected that at an early date this will be increased to from 20 to 25 tons. The quality of the metal is excellent, and it is freely bought. The Company's property measures about 1,050 acres, of which as yet only about 32 acres have been proved, so that if the remainder of the property turns out as well, the prospects of a large yield for a long time to come are very encouraging. The Company have been in possession for only twelve months, and they followed several owners who from one cause or another failed to make the mine a success. The place is, however, now under very efficient management, and the energy and experience of Mr. Gay Roberts, the Manager, seem likely to prove very satisfactory to the Company, who believe that after this preliminary experience the mine will prove a dividend-paying investment. There are about half-a-dozen Europeans employed and between 20 and 30 coloured workmen. With the increased production contemplated, this will, of course, be considerably increased. The works are only four miles from a railway station, so that the cost of the delivery of the concentrates at Capetown is insignificant.

APPENDIX XV.

Memorandum by Mr. W. Lorimer of a Conversation at Port Elizabeth on March 13th, 1914, with Mr. Carl Friedrich Wolff, of Messrs. Adolph Mosenthal & Co.

Mr. Wolff's firm are merchants in Port Elizabeth and other South African towns, but Mr. Wolff himself in his early years lived in the Styrian district of Austria, and gained some knowledge of the iron mining and manufacture carried on there. Some time ago while visiting the Kenhardt district for the purpose of investigating agricultural resources, he quite accidentally noticed a kopje which contained an outcrop of iron ore. The kopje in which he found this ore is only one of an enormous number stretching eastward for about 100 miles and terminating at Postmasburg, where ore is known to exist. The samples which he took away from the former district he had analysed by Mr. Crosse, of Johannesburg. The analysis which he submitted showed the ore to be of singularly fine quality. The percentages of phosphorus and sulphur are practically negligible, while there is no titanium whatever in the ore. There are known to be large fields of iron ore in the neighbourhood of Pretoria, but this contains so large a percentage of titanium that it would render smelting by blast furnace extremely difficult and costly. Did the whole range of kopjes extending for 100 miles contain ore of a character similar to that of Mr. Wolff's sample, which he is inclined to believe, it would be difficult to exaggerate the value of the deposit. It is, of course, obvious that one cannot possibly found much on a single analysis over so extensive an area, and I propose to make further enquiries of the Government geological and mining authorities. Assuming that there really is a deposit of anything like the magnitude believed by Mr. Wolff, it is, of course, certain that the ore could not be utilised in South Africa as ore for many generations, and in order to utilise it it would require to be shipped to England or elsewhere. Before even this could be contemplated it would be necessary for the Government to build a railway into the field, the present railroad being about 125 miles away. It would then remain to be ascertained if the ore could be carried to the nearest shipping port and thence by sea to England at rates which would enable the deposit to be profitably worked.

One grave difficulty in the way of smelting the ore where it is found is that the nearest coal is 350 miles away.

With respect to coal, indications of its existence have been found in the neighbourhood of Port Elizabeth, but such trial borings as have been made have proved disappointing. Anthracite was found, but it was only an outcrop. The records of the bores in this case are, however, imperfect, and Mr. Wolff wished to reinvestigate, but the owner of the farm asked £50,000 for what, as agricultural land, is worth not more than £5,000 to £8,000. At another point a man looking for water found what appeared to be coal at 30 feet depth. Mr. Wolff thought it was only shale, but the analyst reported that it was an inferior coal. A geologist said that the occurrence being near the surface it was likely that coal would be found deeper, and Mr. Wolff is now seeking prospecting rights. Geologists say that the Karroo is a formation favourable to coal, and it is possible, therefore, that this may yet be found in great abundance.

Iron ore occurs in Rhodesia. This ore, so far as yet worked, contains a considerable percentage of chrome, and there are regular exports at about 45*s.* per ton.

P.S.—I ascertained at Johannesburg that the existence of the deposit of iron ore to which Mr. Wolff called my attention has only quite recently become known to the Government. It has not yet been carefully examined, and in point of fact very little is known about it.

APPENDIX XVI.

Note by Mr. W. Lorimer on a Visit to the South African School of Mines and Technology at Johannesburg, on April 2, 1914.

The South African School of Mines and Technology at Johannesburg—a development of an earlier and less important institution—deserves note because of the excellence of its equipment and the high standard of its teaching. This teaching is peculiarly fitted to provide suitable training for those who have to carry on the great mining industry of the Rand. The teaching is of university standard, and there are Professors (with Assistants and Lecturers) of Mathematics — pure and applied — Chemistry, Physics, Geology and Mineralogy, Mechanical Engineering, Civil Engineering, Electrotechnics, Mining and Surveying, and Metallurgy and Assaying, besides a Lectureship on Law.

The Government and the great mining companies have given liberal assistance, and the latter have also provided numerous scholarships, and find employment for the young men who take the diploma of the school.

The buildings occupy an excellent site, with ample room for future expansion.

The school has no power to grant degrees, but the students can offer themselves for examination by the Cape University and so obtain the science degree of that well-known institution.

APPENDIX XVII.

Note by Mr. W. Lorimer of a Visit to Vereeniging on April 7th, 1914.

A desire, which has long been widely felt, to have some of the iron and steel requirements of South Africa made in the Union, led the Government some time ago to enter into a contract with a syndicate to supply all the scrap iron and steel made on the railways at a very low price, on condition that this was converted into steel suitable for the general purposes of the railways and of other consumers. In pursuance of this purpose the Syndicate, represented, I understand, by Messrs. Lewis and Marks, have erected on a site at Vereeniging, and immediately contiguous to Messrs. Lewis and Marks's collieries, a Siemen's open-hearth furnace, in which the wrought iron and steel and scrap, with an admixture of pig-iron and cast-iron scrap, is reduced. No ore is used in the process but scale is used for the purpose of decarbonising. The product is occasionally high carbon steel, as may be arranged, used for the purpose of making light rails and tube mill pegs, but, generally, a mild steel is made for angles and bars. It is, of course, not possible here to roll direct from the ingot and there is one re-heating furnace, and also a furnace for a 600-ton press, which dispenses with the use of hammers. The rates of wages paid to white men vary from 18*l.* to 48*l.* per month; first-hand smelters getting 30*l.* per month and first-hand millmen 45*l.* per month; while the coloured men get from 1*s.* 6*d.* to 2*s.* 6*d.* a day and food. Under recent management it has been found possible to use coal costing only 6*s.* a ton. Formerly, the coal used in

the gas producers cost 27*s.* 6*d.* a ton. The prices received are 9*l.* to 11*l.* per ton for mild steel bars and angles, and up to 16*l.* per ton for high carbon steel. The arrangements are good and the work satisfactory within existing limits, but the manufacture is on too limited a scale to make it at all profitable without the high prices received for sales and the very low price paid for scrap iron. There is here, no doubt, the potentiality of a large and prosperous industry, which, however, can never be thoroughly developed until it is possible to use native ores converted into pig iron.

In the immediate neighbourhood of these works the Victoria Falls and Transvaal Power Company have one of their four stations erected to supply the Rand mines with electric power. Of the other three stations, two are smaller and one is larger. The latter, the Rosherville Dam, six miles from Johannesburg, has a product equal to 100,000 h.p. The station, which was seen, is most admirably equipped, and the whole of the arrangements are of the most modern and perfect description, and, I should imagine, must be in all respects satisfactory to consumers. The name is perhaps misleading to strangers, as the situation of these different plants is more than 1,000 miles from Victoria Falls. The whole of the electricity produced is developed by steam power.

APPENDIX XVIII.

Johannesburg, Saturday, 4th April, 1914.

EVIDENCE GIVEN BEFORE A COMMITTEE OF THE COMMISSION CONSISTING OF MR. J. TATLOW AND MR. J. R. SINCLAIR.

Mr. C. F. STALLARD, K.C., examined.

(*Witness.*) I was at breakfast the other morning with Sir Edgar Vincent, and, talking over things in general, I put forward my views shortly on the necessity of separating the white and black races in South Africa. He appeared to be interested, and wondered whether this would meet the views of the native races. I informed him that I could bring some natives before the Commission, and from that has arisen my presence here this morning.

1. **(Mr. Tatlow.)** Very shortly, what is the present relation at the present time?—It differs in the different Provinces, but it is a survival of the position in which the white races overcame and conquered the blacks. At the present time the white races use and exploit the natives for their own ends, and I do not think I can do better than refer you to the old Squatters' Law of the Transvaal, Law 21 of 1895.

The Boer policy towards the natives was to divide them up amongst the farmers, allowing each to retain sufficient to do his work. It was a policy deliberately planned to take the native away from his own surroundings and from their tribal organisation. Thereafter came the great industrial development arising out of the discovery of gold and diamonds, when black labour was urgently required, and you may have heard that there is now a highly organised system of recruiting blacks for work on the mines, and that the four corners of the sub-continent are being scoured, even outside the Union, for the purpose of bringing in blacks to do the work, whilst whites are unemployed and becoming unemployable. It is wholly an abnormal and unsatisfactory condition.

In the Report of the Economic Commission, lately presided over by Professor Chapman, it was remarked that between the skilled white and the black there is a sudden drop; in other countries there are various grades, but there is no gradation in this country; you have a skilled employee directing the natives and then you have nothing until you come down to the native himself. The result of this has been seen in many directions. I have seen it myself as a member of the Witwatersrand School Board. A very large proportion of the boys who leave drift into blind-alley occupations—lift-boys, messengers, street-sellers, and all sorts of odd jobs—because there are so few openings, compared with other countries, to absorb them. Many of these lads receive a fifth-standard education, leave school, and have no option but to take up their blind-alley occupation.

I am speaking, sir, of Johannesburg, but the same conditions apply in other districts throughout the whole country. We have tried, and tried vainly, to remedy this state of affairs, but the work which is done in other countries by young lads, especially in assisting their fathers in their trades, under our artificial system is done by natives.

What has been the result? We have a less skilled white population than we should have; we have also got a large criminal population.

In support of the first point I may refer to the report of Mr. Ross Brown, who was brought here some years ago from America, I think, by the house of Eckstein (or one of the other big houses) to report on the mining question. In his report* Mr. Ross Brown stated that the average efficiency of labour here was only about one-quarter when compared with the mines of California. This applies to the whole labour unit, which includes both black and white.

In mining here, the white man, under our abnormal conditions, is principally occupied as an overseer, whilst rough manual labour is mainly done by the black. The effect of the presence of the black man on the mechanic or tradesman also is to decrease his efficiency, because he is not so continually exercising the tools of his trade. This re-acts upon the position of the children, and it is difficult, almost impossible, to apprentice a boy to a trade here. The employer wants to make the most of his skilled white man's time and is not inclined to allow him a considerable amount of time which is necessary to teach white lads their trade. I could elaborate on this to a great extent, but I have indicated the nature of the evil.

The white unemployed have a difficult task to make ends meet; and the less scrupulous turn to crime, particularly to the crime of selling of liquor to natives, and also to illicit gold and diamond buying, which is facilitated by the presence of natives. We are making criminals of our poor whites on a wholesale scale, and the appalling figures have been commented upon by judges, ministers, and citizens.

The expense of all this, the wastage of educated youths, the wastage in the lives of men, the wastage in the administration of justice, the time of the judges, magistrates, the lawyers, the police, the detective force, the jails, and the jailers, the whole of this is caused by the artificial system under which we exist. To the cost of so-called "cheap" black labour all this additional expense, all this loss to the country, must be charged.

2. Of course, Mr. Stallard, in all countries there is a measure of this wastage where there is no question of black labour?—I am quite aware of that, but it is increasing to an alarming extent in this country, as statistics will show. Liquor-selling is the chief and the most degrading.

3. Is the record of such crimes kept distinct in the case of white and black?—Yes; you will be able to get statistics on that. They have had the most severe punishment for the first offence for selling a single glass of liquor. First offenders have received six months with hard labour, without the option of a fine, and it has had no effect. The low white will always pander to the black, who is not able to resist. My point leads up to this. Contact between white and black has wrought evil to both races. I have been putting the matter from a white point of view, and you will hear from the lips of natives qualified to speak from the point of view of their people.

* "Working Costs of the Mines of the Witwatersrand." Paper read at the General Meeting of the South African Association of Engineers, June, 1907.

Some natives, who have come here from their kraals, have taken to crime as a profession. It has been estimated by the police that there are something like 2,000 such native criminals in the Witwatersrand area —a floating black population organised often into secret societies, with their own captains, judges, officers, and so on. An account of such a society you will find in the record* I have handed in. I blame the whites for it. We are taking the native from his own life, from his own social system, and forcing him into twentieth-century competitive conditions, and he is unable to hold his own.

Unlawful intimacy between black and white is also increasing. It is illegal for a white woman to have connection with a black man, but there is no corresponding law making it illegal for the white man to have connection with the black woman. The "black peril" is realised here; is a very grave one, and the corollary to that is the "white peril" to the native. Natives resent this every bit as keenly, I believe, as we whites resent the interference of the black with white women. It is a very grave peril, indeed, from both points of view; bitterly resented by both; and it has led to the creation of a coloured race rejected by both, and by both disliked. You have got to remember the proportions of the races in South Africa. There are, roughly, four-and-a-half millions of blacks to, roughly, one-and-a-quarter millions of whites in the Union. I need not elaborate on that.

Now, the question is, what ought to be done to prevent this? To my mind you cannot, by force of laws or by penalties, prevent the evils with which I have dealt. The only way is to make it physically impossible that there can be this contact, and the only way you can do this is by segregation. I do not mean segregation based upon territory only, or the segregation which makes all the skilled work done by the whites and the unskilled by the blacks. This is absolutely unjust, and it would fail in meeting the object we have in view. Give to the natives territorial segregation, not merely locations, but give them territory of considerable size, where they will be able to lead their own life under their own social conditions, and according to their own ideas. The native of South Africa is essentially a socialist. We are more individualistic. Their system has been broken down owing to natives being recruited and brought here to work on the mines. I believe if we were to set apart territories fairly chosen with regard to locality, and say that in these territories they can lead their own lives in their own way, that would be attractive to the native. I repudiate force altogether, and I am speaking as a man with experience. It should be an appeal to their better nature, and in accordance with their legitimate desires. Why should they not get away from interference with their habits and free from restrictions? Why should they not have kaffir beer? They are accustomed to it. Why are they always bound to live apart in certain areas chosen for them, and not allowed to move freely within their own territories. If you do that, you will see here a development akin to the development of Australia, New Zealand, and Canada. It will be infinitely better for the white and for the black. Both will be developed to the utmost of their powers and along the same lines, not being forced or pushed, and the native will not be made to specialise on hammer drills, but he will be allowed to choose his own mode of life and develop himself along his own lines. You cannot separate white from black in a day or a year, but forbid recruiting outside the Union. That will cause a shortage of black labour; wages will rise, and the shortage of blacks will be filled by whites. According to Mr. Ross Brown, the average unit of efficiency on the Rand in mining was only one-quarter of that in California. It would pay the mines very much better to employ more skilled labour at a higher rate of wage.

4. **(Mr. Sinclair.)** You do not propose that compulsion should be imposed upon the native?—No. My plan is attraction.

5. What will be the native view of the scheme that you put forward?—You will hear from two natives this morning, who are in a position to inform you on this important matter. Amongst the chiefs and amongst the men you will find that the majority are in support of my scheme. One of the results of the young men going out to work is the loss of tribal authority. The young men revile, the girls scorn, and the chiefs lose the authority they once had over them. I think this will be backed up by the opinion of a large number of themselves. Most of the natives I have had to deal with (and I have had considerable experience of them) do not like being amongst the whites. They would prefer to lead their own life. The wages they get they find do not go very far, they are squandered in the fines imposed on them and then there is the trouble with the Pass Law, which acts as a big tax upon their earnings. I have sat as a magistrate in the country areas, and the Pass Law is a big tax on the natives. The country is divided into labour districts and non-labour districts. Those districts which are labour include the Witwatersrand. A native has to carry a pass which has to be renewed every month, and the fee of 2*s.* has to be paid by his employers. He must always carry this pass in that particular district in which he is engaged. If he wishes to travel outside of that area he must get special authority. Then, if he lives in a compound, it is just the same. He has got to have a pass outside the compound. On the farms outside a labour district a native is not allowed to travel outside the farm unless he is carrying a pass signed by his master, and he can only go a short distance with that. If he wishes to travel outside the district, he has to go to the nearest Pass Office and get a special pass to go elsewhere. If he travels without a pass he is liable to be arrested by any policeman, native or white, without warrant, lodged in gaol, brought up at the first Court day, taken before the magistrate, and fined from 5*s.* to 1*l.*

6. Does this apply to domestic servants in Johannesburg?—Yes. There is a monthly pass in labour districts. The master pays the stamp, but the fines are payable by the native himself. The revenue goes to the Union Government. The fine is imposed because he transgresses the law under which he holds it. I think that this is an important factor in making the native in favour of segregation in order to get away from the vexatious conditions that are created by the Pass Law.

Under the scheme which I propose, I would make everything permissible for a time. I would set aside land for the natives. A great grievance with the native is that the Act recently passed by the Union Government prevents their holding land. You will hear what their feelings are on this matter.

7. What revenues have the chiefs?—They have their tribal lands. The natives may be divided into two classes—those who have chiefs and those that have not. A number of them are not attached to any chief.

8. How has that come about?—Through the operation of the Squatter's Law, whereby the Government divided families among the farmers. These families lived on the farm and increased, and there you are.

9. And if lands were set apart and a start was made with segregation?—A great number of them would have no chiefs.

10. Under your scheme, would you impose penalties in order to compel them to live in their territory?—I would go to this extent. I would discourage blacks in the white area. The present colour bar is no restriction. I think it is unjust, and I could not attempt to justify it.

11. If a large number still prefer to work under the present conditions, or improved conditions, could the system be maintained? Would it not break down?—I think that under the scheme proposed by me you would find that the bulk would go and live on their own reserves. A minority would be left, but they would not have the same scope. It would cease to pay employers to lay out their schemes on a black basis. It would not pay them. It necessitates particular organisation of special buildings, &c. The whole thing would cease to be profitable to the big employer, and he would have to lay out his scheme of operations on a white basis. The minority would find that their opportunities were dwindling, and they would increasingly migrate into the black area.

12. Without expressing an opinion as to whether it would be desirable, I think it would have the effect, would it not, of restricting some of the mining industries that are now carried on?—I would prefer, sir, that that be answered by one more qualified than myself to speak about mining conditions.

13. It is common knowledge, is it not, that there are some mining industries that could not be carried on with more expensive labour?—For my own part, I

* Not printed.

would gladly put up with any temporary dislocation, because it seems to me that the issue before the State is of such tremendous importance.

14. Would not one effect of segregation be the same evils of which you complain? Would not it be to arrest that development of the native which must take place by the discipline of work, and by improved conditions, which must obtain as time goes on?—In my system I do not suggest the doing away with teachers, schoolmasters, instructors, and so on. I rather leave the native to work out his own salvation in his own way. We have an example in Basutoland. There industries are initiated by the natives, and under my scheme they would develop industries that would fill the bill, so to speak, for their future.

15. Do not you think that with improved conditions and education, with the discipline of work, there is a wider field for the native as things are at present?—I do not, sir. There is too much temptation to the native, caused by the close contact with the white, and this tends to degrade the average native. When you are dealing with the two races the one naturally starts from a different point and tends to prey on the other. If you are dealing with the best of both races, the evils are very slight, but we are dealing with masses of people who are unrestrained by any scruples, and under the present system I maintain that conditions will not improve.

16. At the commencement of the association of two peoples there must be evils; they are inevitable; but do you suggest that contact with our people is so deadly that the native cannot survive, that he must go down, and that he will be utterly degraded unless he is cut off from the people of our race? And that that condition can never be altered?—I do not think so, sir, except by separation.

17. It is a severe judgment on our race.—I am afraid it is a true one.

18. Do not you think if areas of land were set apart for the use of natives, and they were in that way given the support of some assistance by outside work that they could do, that they would become more and more independent, and in that way be less liable to the abuses under the existing conditions, and that they would gradually develop and strengthen and get better fibre?—I that it that your question is whether it would not be better to allow them to go out among the whites?

19. Do not segregate them entirely; leave them the opportunities that they have to-day; they would then have the advantages of some independence from their land, and they would have the advantages of work. I would suggest that the combined effect would be to strengthen them and to enable them to stand up for themselves better than you seem to think them capable of?—That is no doubt the way we would begin, and after the system had been in force for some years we might have to modify our views with increased knowledge. My own opinion is that the process of segregation would have to be carried out to the conclusion.

20. You would allow the system to be permissible for a period to see how it works?—I do not like compulsion methods, but I might have to use compulsion if there were a small minority left. Some whites would need compulsion, the traders more particularly in the native areas. Compulsion would require to be applied to them.

21. Suppose that the attraction of wages drew large numbers still to the mines?—It would be a shock to me, because it would prove that my conclusions were wrong, and I would have to go all over my calculations again. Even if I were wrong I would still try some other way. I am strongly of opinion that unless we have territorial segregation the tendency will be for South Africa to become, in an increasing degree, a black and coloured man's country.

Mr. R. W. Msimang examined.

22. **(Mr. Sinclair.)** You have heard Mr. Stallard's evidence?—Yes.

22A. How would you deal with the question of segregation? Would you favour us with your view or the views your people hold on that subject shortly and generally?—First of all I may say that there is some difference of opinion in regard to the question of segregation amongst us natives, but the opinion, so far as I have been able to gather, is only as regards the form of segregation. The natives are agreeable to the principle of segregation as such, subject to this: that they do not like that it should be forced upon them without their opinion being taken on the matter.

23. Absolute segregation is not suggested, but rather territorial segregation—the black living on the one side and the white on the other?—That form is, I believe, entirely opposed by a good many of us. We do not believe that it could be to our advantage, in fact we look upon it as a policy of extermination. Those of us who have had the privilege of having a certain amount of education think that a policy such as that would put an end to us. It would force us back again to the earlier condition of things, and we would like to see our people advancing along their own lines up towards a higher stage of civilisation. We have had a great deal of contact with civilised people, and nothing in the shape of territorial segregation would be to our advantage. In fact, I think it would be an absolute failure from both the white and black point of view. It would be found by both sides that they require each other. Shortly stated, that is the general opinion on the question of absolute segregation.

24. I leave that, and go to the question of partial segregation?—I believe that the majority of us are in favour of partial segregation. That is to allot certain areas throughout the Union and say to the whites—You live there, and to the blacks, You live there. Of course, you must allow for expansion of the native population under any scheme, and the native would not be prohibited altogether from going out of this area to labour. We have already native townships, we have native reserves, and locations. You have an example of that in the Transkeian Territory. This is practically a native reserve, but there are a good many European traders and others. In Natal there are mission places where only natives live, and you find that the natives seldom desire to leave these stations to live in towns. This policy has been carried out voluntarily, and any encroachments have been made, we maintain, by the white people, and if you carry out the policy of partial segregation it must be by improvements on these lines, so that we can have our own areas and have our own industries, initiate our own improvements and carry on as far as we are able. Of course, it must be remembered, we can only do this with the aid of outside sympathy and capital. We ourselves have no capital of our own. We are of opinion that on these lines, so long as it is not forced at the commencement of the policy, and not artificially pushed, the system of partial segregation would undoubtedly be for the benefit of our people. There would be more labour for our population and a gradual increase of capital. Then the next point on which we are agreeable to accept the policy of segregation is on the ground of miscegenation. We do not like it; we hate it. It is increasing, and can only be stopped by partial segregation. We find that it is to the ruin of our people, because they are exploited to a great extent. But we know that we want labour. Under the present conditions the native is practically forced to come to industrial centres for work because of the heavy taxes and many other things which they are called upon to pay. The question now arises as to how they can be attracted back to their reserves. We think that it would be fatal to the whole population to do away with black labour at the present moment, and we come back to the question that it would have to be a gradual process. It would have to be a process of evolution. Then there has been a great deal said that since we approve of the principle as a principle, why then do we not accept this Native Land Act, which is intended for the purpose of segregation? We do not agree with the Act. We do not think it fairly carries out the policy of segregation. It is absolutely one-sided, and the second point is that it does not sufficiently provide for our native population. To start with, of course, we are prevented from buying, selling, hiring or letting land. It does not interfere with existing rights or contracts. Land with us is held on the communal system, and in the past we have had to

buy land from Europeans, and land is our only capital.

The want of land hampers the improvement of the native because he relies upon the land for his subsistence, and for his gradual improvement. Under the new Act we cannot hire or lease land any more. Now, if a man has to leave a farm to go to another, he has to go there to labour. He pays nothing for the right to squat, but the white farmer gives him a piece of land, which is often not even sufficient for him to maintain his family decently well. He spends the greater part of his days working for the white farmer in return for that little. When he wants to go beyond the farm he must get the permission of the white farmer, and that permission can rarely be got at the time when he wants it. The result of this is that we find large numbers of our people wandering about the country living a life of vagabondage, and living under extreme distress. We do not like this new Act, and we are going to use all our efforts to get it repealed sooner or later. So far as the principle of segregation is concerned, that is partial segregation, whatever policy is carried out you must take into consideration the existing condition of things. The races at the present time cannot afford to part. We are doubtful whether the natives will be given under the new Act sufficient land so that they will be able to live decently and to advance forward as they are capable of doing. Segregation, complete segregation, is not a policy that can be forced or pushed; it must be gradual. I would like, sir, to pass on to one more point, that is regarding our position in Parliament, that is, the question of representation.

This question of race problem, from our point of view, depends upon two things. The first is representation, or giving the subject races the right of consulation. And the second is that there must be opportunities for improvement. You must grant equal opportunities; in other words an open market for labour and capital and energy. It would seem to us that the solution depends upon that. If we get these two things and we get the right to improve ourselves industrially and commercially, without any restrictions, we should soon be able to maintain ourselves and be an independent people. We are still dependent upon the whites. We require to come to them for money, and for labour, and for capital. We claim this right of representation on an important ground. The first one of representation speaks for itself. We believe that once a native has fully developed himself and has attained to a high standard in life he should be recognised as a full citizen and should be given the right of representation. There are a great many natives who have sufficiently worked themselves up.

Then there is the advocating of the right of consulation; that is to say, the right of the natives to a voice in their own affairs. Give them some channel to voice their affairs even if you cannot grant direct representation. We would be very glad to accept that, and we know that there are a great many Europeans advocating this, including the great missionary bodies. What has been suggested is an Advisory Board, Native Councils in the different Provinces, and we ourselves claim that we already have a Native Parliament in the South African National Congress, a political organisation which represents the various South African tribes. It is composed of two assemblies, the lower house with delegates from the various tribes, with the higher house. Of course, the chiefs have always the final voice, and the upper house has the right to veto the lower house.

We believe that had this Act not been forced upon us, that had we been consulted, we could perhaps have evolved a better law.

25. We gather from you that your people are not in favour of territorial segregation, but that the majority favour partial segregation, and that one of the principal reasons why you wish this is because of miscegenation. Do you think that partial segregation would minimise that evil?—It would minimise it to this extent that there would not be so many women in the white areas as there are at present.

26. You would have in one direction a clear field to breed a pure race. You think that that would be a great improvement on existing conditions?—I do. Of course, in the industrial centres the trouble is difficult to deal with. Segregation already obtains in these industrial centres—you have locations, townships—and no native could live but in a town unless he has a permit of his master, but this is not sufficient protection as against the encroachment of the white people.

27. You have told us that your people want the advantages of work and education in the meantime. Would you propose that even partial segregation, which you support, could be territorial, or would you have your people segregated in the locality of industries where they could get work?—As I have said, we could have townships; we could live there and work in the industries, and have a place to which we could always go back, but you must guard us against white encroachment.

28. I suppose the basis of any movement in the direction you support must be the getting of land?—That is the first step.

29. You speak of objections that you have to the existing land system. That system, you say, makes no provision for setting apart any land for your people? — It makes no provision; it makes only a promise.

30. No provisions as regards occupation which you formerly were at liberty to avail yourselves of under the old law, and it presses hardly against your people? —Yes.

31. But was it not the design of the Act to bring about, or to try to bring about, the cultivation of land which the State believed was not profitably used before?—That may be, sir, but how would that affect us?

32. The old form of occupation of land by your people was regarded as not being in the interest of the State as a whole. Your people were not utilising the land as they ought to have done. That was the suggestion, was it not?—I believe, sir, it was the suggestion.

33. Do you suggest under the old conditions that land was being worked to its full capacity?—I do not say that. Land at the present moment, even under the supervision of the white man, is not being worked to its full capacity.

34. Have you anything to say, from your people's point of view, to this Commission of the general conditions of labour by your people in the mines? Are you in a position to speak with authority on this question?—I am not, and prefer not to make a statement.

35. About the question of townships in the neighbourhood of the mines? — The system of township would be one in which we were able to have a large plot and with a portion set off for grazing. The township should accommodate a population of about 800 upwards, and it would be necessary to allow for expansion through the increase of population.

Mr. C. S. Mabass examined.

36. **(Mr. Sinclair.)** You have heard the evidence that has been given by your colleague. Are there any points not dealt with by him which you wish to bring before the Commission? If so, we should be glad to hear them?—I endorse all he said, but there is one point with reference to the Defence Force. That point has hurt the native mind to a great extent.

37. Any views which you would like to put forward on the question of segregation we should be glad to hear, but leave out any question about the Defence Force. The policy of the Defence Force does not come within the scope of our enquiry?—We believe, then, that with reference to segregation any scheme imposed on us will not be for our benefit. That is a matter of general opinion amongst the natives, and I endorse all that my colleague has said, and I speak with twenty years' most intimate knowledge of Swaziland. We reckon that all these questions would be settled if there was a commission appointed to go into the natives' grievances. It is desirable that wider knowledge should be acquired by the State with reference to real difficulties and grievances which the natives suffer.

38. Have you anything to say to the Commission on the subject of the supply of liquor to your people?—Yes, that question is one of the reasons why we are in favour of segregation, because we put the blame mostly on the low-class whites that are about here in

the mining districts. They put our people up to a lot of bad habits and place unnecessary temptation before them.

39. In other words, that they have a bad influence on your people who, at their present stage of development, have not any great resisting powers?—I think matters would be improved if we had a system here something like the one in Durban. There, beer is brewed for the natives.

40. Have you anything to say with regard to the system of selling liquor in bottles by stores?—It is a great evil. It ruins our nation, and if the system of bottle licences was abolished we think it would be greatly to the benefit of our people.

41. Can they get liquor on credit?—No, sir.

42. Supposing a white store-keeper sells a native a bottle of liquor, is there anything to prevent him suing the native for the price?—He dare not. He knows it is illegal all the time.

43. Even if he is one of those store-keepers on the mines: Can he not do so?—No, sir.

44. Is the selling of liquor absolutely prohibited by law to the natives?—Yes, in the Transvaal.

45. And you think that if the Government introduces the Durban Corporation system, it would decrease the evil on the Rand? — It certainly would. The liquor evil is a serious menace to our people.

VI.—TRADE.

(a) Exhibitions.

CAPE OF GOOD HOPE.

Cape Town, Tuesday, 3rd March, 1914.

Mr. John William Jagger, M.L.A., Wholesale Merchant and President of the Cape Town Chamber of Commerce, called and examined.

(*For the evidence of this witness on "Statistics," "General Trade Questions," and "Legislation," see pp.* 127, 145, *and* 181 ; *and on "Land Settlement and Irrigation," on "Steamship, Post, and Telegraph Communications," on Harbours and Coal for Bunkering," on "Empire Development," and on "Fruit," see pp.* 6, 60, 102, 160, *and* 317 *of* [Cd. 7706].)

2685. **(Chairman.)** Have you any definite views on exhibitions?—Yes, I think we are apt to get too many of them. Of course, they are all right from time to time, say at longer intervals.

2686. You think the money could be spent in a better way?—I certainly think so.

TRANSVAAL.

Johannesburg, Friday, 3rd April, 1914.

Mr. Howard Wallace Soutter, Mr. Alfred Falkland Robinson, and Mr. Ernest Chappell, J.P., representing the Johannesburg Chamber of Commerce, called and examined.

(*For evidence of these witnesses on "Migration, Land Settlement, and Irrigation," see p.* 46, *on "Posts, Telegraphs, and Steamship," p.* 81, *on "Bills of Lading," p.* 91, *on "Railways, Harbours, and Coal for Bunkering and Shipment," p.* 140, *and on "Empire Development," p.* 161, *of* [Cd. 7706] ; *and on "Statistics," see p.* 130, *on "General Trade Questions," p.* 173, *and on "Legislation," p.* 183 *of this Volume.*)

The Chamber had previously furnished to the Commission the following Memorandum on the subject of Exhibitions:—

Exhibitions.

It is considered that it would be of advantage to Empire trade if there was established in London a permanent Exhibition of the productions of the several Colonies and Dominions. The Chamber desires, however, to associate itself with the protests which have been made against many of the side-shows which have been attached to some Exhibitions in the past, purporting to represent native life, &c., as being false to actual natural conditions and calculated to have harmful results.

2687. **(Mr. Sinclair.)** Does your Chamber interest itself in seeing to it that the Union is well represented in the permanent exhibit at the Imperial Institute, London?—(*Mr. Soutter*) The Chamber has represented to the Government the importance of that exhibition, but our reply from the Government has been that they are short of funds. We do not think that South Africa, at any rate, is adequately represented in the exhibition which is held in London to-day, compared with the other Dominions of the Empire. The exhibit is a very poor and inadequate one.

2688. I do not think it does justice to the Union?—No; we do not think so either.

(b) Statistics, Weights, and Measures.

CAPE OF GOOD HOPE.

Cape Town, Thursday, 26th February, 1914.

Mr. Alfred Joseph Smith Lewis, Principal of Customs Statistical and Audit Branch, Cape Town, called and examined.

2689. **(Sir Alfred Bateman.)** You are the head of the Office of Statistics and Audit in Cape Town?—Yes.

2690. You prepare statistics on imports and exports?—Yes.

2691. You have been so good as to send in answers to certain questions?—Yes.

The following were the questions submitted to the witness:—

Uniformity in Statistics.

What views are held?

1. As to the desirability of uniformity in the Mother Country and the Dominions;
2. As to the practicability of such uniformity from the South African point of view

on the following matters:—

A. Record of countries of origin and consignment.
B. Classification of imports and exports.
C. Landed value of imports.
D. Valuation of exports.
E. Statistical system of weights and measures.

It has been suggested that the way to uniformity would be smoothed if a conference of statisticians of the Empire (and possibly Customs officers) were to meet to consider such points as those enumerated above. What is your opinion on this, and as to the creation of a central statistical bureau?

The following answers were given by the witness:—

Memorandum.

The following remarks must be taken as bearing only upon statistics relating to imports and exports, which cover the scope of the department under my control.

I.—*As to the Desirability of Uniformity in the Mother Country and the Dominions.*

Imperial uniformity would seem to be so desirable that any arguments in favour of it need hardly be adduced. In this connection it might be as well, however, to refer to the South African experience prior to the 1st July, 1905, from which date the South African Customs Statistical Bureau was established with a view to securing to this portion of the Empire a comparable and uniform system of trade statistics. Previously each party to the South African Customs Union, numbering five principal adherents, compiled and published their own statistics, which were not only prepared on different classifications, but which actually adopted divergent bases of compilation: the result was not only distinctly lacking in comparability, but, in many instances, hopelessly misleading. The establishment of the central bureau, whatever it may *not* have accomplished, at any rate made correct comparisons in this quarter of the Empire possible.

Doubtless the difficulties of establishing an Empire Central Bureau will be very much greater, but the experience and resources of those who in the past have been responsible for the older systems of statistics in the Mother Country and its Dominions ought to be able to surmount these.

II.—*As to the Practicability of such Uniformity from the South African point of view on the following Matters*

A.—Record of Countries of Origin and Consignment.

The record of countries of origin of imports adopted in South Africa is not a difficult problem, inasmuch as the law provides for a definite declaration of the country in which all goods imported are grown, produced, or manufactured, in order chiefly that goods the growth, produce or manufacture of the United Kingdom or any reciprocating British possession may be admitted at a preferential rate of duty; for statistical purposes, also, a close scrutiny is maintained over the declarations by importers of countries of origin of goods imported. With regard to countries of consignment of exports the position is, however, not nearly so satisfactory; as most of the exports are carried in vessels belonging to regular lines trading between the United Kingdom and South Africa, exporters of produce are in the habit of declaring the large majority of their shipments as destined for the United Kingdom; often they are not in a position to do otherwise, for various reasons. The direct result is that the exports to the United Kingdom are unduly inflated, while it frequently happens that the export of a given commodity to a certain foreign country is known to be considerably larger than the published official figures would appear to indicate. For a concrete example of this *vide* "Cape Times" of Tuesday, 24th February, 1914, sub-leader page 8, and memorandum with schedule from Mr. R. Renner, of Johannesburg, on page 10.

B.—Classification of Imports and Exports.

So far back as August, 1907, the Board of Trade issued a note to the self-governing Colonies on this subject, the reply sent from this centre, being applicable to-day as much as at that time, might be recorded. It ran as follows:—

"All the classifications are governed very largely by the tariff items, and for the present it is not clear how it could be otherwise; a group classification satisfactory to all portions of the Empire could only be devised after careful consideration of the various tariffs of the United Kingdom and Colonies and dependent territories, and this, it is felt, could only be arrived at after conference of statistical representatives of each unit in the Empire; it might, therefore, be most advantageous for such a meeting to be arranged by the Board of Trade."

The difficulties under this head, owing to the possibility—one might almost say probability—of frequent changes of tariff in some portion of the Empire, could only be satisfactorily provided against after an interchange of views and a consequent appreciation by each unit of the difficulties of all the others in this connection, and such appreciation might result from a conference, but would not from a correspondence extending over a very lengthy period.

C.—Landed Value of Imports.

The values for imports used statistically in this Union are those upon which duty is or would be assessed *ad valorem* if a general *ad valorem* tariff existed; no additions to declared values are made in order to arrive at a statistical value, which, therefore, is an either f.o.b. or less than f.o.b. valuation.

D.—Valuation of Exports.

Valuations of exports are, in the main, accepted as declared to, and no machinery exists for the exercise of an efficient control, which under existing arrangements would be both expensive and cumbersome. Generally the market rate at time of shipment at the place of purchase for shipment is declared to by exporters.

E.—Statistical System of Weights and Measures.

For value purposes the pound sterling is the invariable basis, while for quantities the avoirdupois pound, the imperial gallon, the cubic foot, or the number of the article, &c., as the case may be, are generally shown; variations of the pound avoirdupois will be found in a few cases where the hundredweight (112 lbs.) or the ton may be used, while in the latter both the South African ton of 2,000 lbs. and the imperial ton of 2,240 lbs. are used, but are invariably qualified to that extent.

The statistical use of the decimal and metric systems could surely only follow upon their general use as the standard of the Empire.

With regard to my opinion on a Conference of Empire Statisticians and the creation of a Central Statistical Bureau, I can only add that, with regard to the former, my views have undergone no change since I penned the opinion in 1907, given above in inverted commas in my comments on Item 2, B, of the Memorandum of the Secretary to the Commission.

With reference to the latter I fear that my comparative lack of experience does not warrant my expressing a very definite opinion.

2692. **(Sir Alfred Bateman.)** Taking first the desirability of uniformity between the Mother Country and the Dominions: you are in favour of uniformity?—Yes.

2693. You say that already, for the whole of South Africa, you have a comparable system of trade statistics?—Yes.

2694. Now, as to the origin of imports, you say that is not so difficult a problem. You require a certificate of origin for the purpose of preference?—Yes.

2695. How much of the value of goods has to be manufactured in the United Kingdom?—25 per cent.

2696. Have the goods to be finished there?—Not necessarily.

2697. As regards the exports, you say you have a difficulty in declaring the true country of consignment?—Yes.

2698. Why is that? Are the exporters unable to give you the country of consignment?—In many cases they do not know where it is going. It depends on the market value when it reaches the European market, and the shipper here does not know the final destination.

2699. Do the exports go mostly in liners?—I think the reason is because the liners are regular traders which have a destination in some port of the United Kingdom.

2700. Now, in regard to imports and exports, you received a Circular from the Board of Trade?—Yes, in 1907.

2701. You consider it would be difficult to make a comparison between one country and another except on broad lines?—Yes. Take, for instance, the usual classification of unmanufactured articles. Things

which are "unmanufactured articles" in this country are "manufactured" in the United Kingdom. There are numerous examples of such articles in the tariff list.

2702. Is duty payable on the value of the goods in the country from which they come f.o.b.?—Not necessarily. It may be less than f.o.b., where supplied or manufactured from an inland place, as railage is not liable to duty.

2703. That is very liberal to the payers of the duty?—Hardly that, because I take it that if the valuation was necessarily greater it would be on a higher basis, and the incidence of taxation might be less.

2704. I thought the duties were all on an *ad valorem* basis?—But that basis has been increased from 9 to 25 in recent years.

2705. If you take a smaller value it means a smaller payment?—But if you paid on a higher value, you might have a lower rate fixed.

2706. As regards the valuation of exports, you see great difficulties?—Yes. In the case of imports you have the invoices, and the importer's declaration is accepted, but it would be impossible with my staff to carry on a large system of query of values. Take a staple product like wool, for instance, the market fluctuates very rapidly and we have to depend entirely upon the values declared by the exporters.

2707. You know what is the market price at the time?—Yes, but unfortunately, as matters stand, I have not the staff.

2708. In the United Kingdom the value is declared by the exporter, and it is gone through by the Customs, who very often send the entry back, pointing out, for example, that wool is now 1s. instead of 10*d*.?—Where economy can be effected and a loss of revenue does not result from such economy, the instructions are frequently to cut down expenses, and I am afraid that, in the past, statistics have suffered in this country in consequence.

2709. You think that sufficient attention is not paid to statistics—that people do not know the value of them?—Yes.

2710. You think that advantage might arise from a conference of statisticians, among them being included the Customs officers who compile statistics of trade?—Yes. I have worked out the South African analogy to show that if Imperial comparability is desirable it can only be attained by having a conference so that the difficulties which centre round the subject may be realised by all, and, as a matter of fact, the comparability that is possible in South Africa and has been since 1906 was only brought about by a conference which ultimately decided on the formation of the first Federation Office in South Africa—the Customs Statistical Bureau.

2711. As regards a Central Bureau for the Empire, you do not express an opinion?—I have not sufficient experience.

2712. But you would be pleased to see statistics of the Empire brought out in uniformity and at frequent intervals?—Yes.

2713. **(Sir Jan Langerman.)** I have had complaints made in regard to invoices which are twofold—the 100 lbs. and the cwt., and also the 2,000 lbs. and the 2,240 lbs. ton, which entails a lot of wasted time in calculations. What is the desire of the traders? To adopt the 100 lbs. and the 2,000 lbs. ton?—I could not say.

2714. What is your opinion?—I have no difficulty, statistically speaking, because we distinguish in every case as to the denomination. We never say 100 lbs. We say one cwt.; and we would take the ton as it is declared. It is so here, because that is the ordinary standard for selling the goods, and we specially distinguish between the Cape and the English ton.

2715. The practice of the Union is in favour of the 2,000 lbs. ton?—That depends, because when you come to the export of copper ore, you find the English ton is used. When you come to the export of coal, on the other hand, you find the South African ton is used.

2716. So you would like to have uniformity?—It does not make any difference to us specially, because, as I say, we are careful to distinguish and guard against any mistake.

2717. Does it not cause you more labour?—No.

2718. **(Mr. Sinclair.)** Have you any difficulty about declarations as to countries of origin?—As far as I can judge, we have not. It is more a matter which concerns the Customs Department than the Statistical Department.

2719. You cannot give us any information as to whether goods come here from London and get preference, the origin of which has been some other country?—I do not think there is much risk of that, because the certificate of preference is in a certain form and signed by a responsible officer of the supplier or manufacturer.

2720. In the Mother Country?—In the place of manufacture wherever it may be, if in the Mother Country or other reciprocating British possessions; not necessarily in the Mother Country.

2721. Do you think that works satisfactorily?—As far as I can judge.

2722. You have heard no complaints?—None have reached me.

2723. **(Mr. Garnett.)** I am under the impression you said that the goods were not necessarily finished in the United Kingdom?—I do not know that there is any restriction as regards finish.

2724. That is to say, if an article on which the bulk of the labour had been expended in England had received some subsidiary process elsewhere, that would be still considered an article of English origin?—Provided it was shipped from an English port and covered by the necessary certificate.

2725. Take calico, for instance, that may have been sent to Holland, say, for some finishing process, reimported into England and then sent here?—I take it that the manufacturer, if he could, would make out the certificate.

2726. **(Mr. Campbell.)** What system have you of collecting statistics here—agricultural statistics?—That would not come under my notice. I am only concerned with Customs.

2727. In regard to your Customs statistics. I see you are rather shy about answering the question of a Central Bureau of Imperial Statistics, but do you not think with regard to trade and commerce there is a fairly large body of Imperial statistics that need publication, and that are not now published, because there is no part of the Empire that is prepared to undertake the responsibility or expense?—I quite agree with the establishment of the Central Statistical Bureau for the preparation of Imperial statistics. My only reticence is in regard to the fact that I have not had any special statistical training. I was in the Customs Department and was detached for the purpose of forming a statistics office. My own experience has, therefore, been rather narrow, and all in this country. Although I feel strongly on the matter, I hesitate to give an opinion before men who have made a bigger study of the matter and have Empire experience.

2728. But you are in favour?—Yes.

2729. **(Sir Alfred Bateman.)** You refer here to a statement in the paper with regard to trade with Germany. I think it was in the newspaper yesterday. The German accounts show double the value of goods from South Africa that are shown from the export accounts here. That confirms what you said about your difficulty in regard to the country of consignment?—Yes.

2730. It makes a very important difference?—Yes. You find the difference most largely in regard to wool and feathers and a few other items of that description But you find, in some instances, that the items almost entirely agree. Take Buchu leaves, for example: 2,750 in the German accounts and 2,745 in ours.

2731. But in these big staples which are dealt with in the United Kingdom it does make a big difference in the aggregate?—Yes. It is the same with America.

2732. Your exports to the United Kingdom are not so large as they appear in your accounts, then?—No.

Cape Town, Tuesday, 3rd March, 1914.

Mr. JOHN WILLIAM JAGGER, M.L.A., Wholesale Merchant and President of the Cape Town Chamber of Commerce, called and examined.

(*For evidence of this witness on "Exhibitions," "General Trade Questions," and "Legislation," see pp.* 124, 145, *and* 181; *and on "Land Settlement and Irrigation," "Steamships, Post, and Telegraph Communications," "Harbours and Coal for Bunkering," "Empire Development," and on "Fruit," see pp.* 6, 60, 102, 160, *and* 317 *of* [Cd. 7706].)

2733. **(Chairman.)** Can you give us any information as to statistics?—We find a big difficulty about statistics in that we can never make any comparisons between our export trade and the imports into Great Britain. There must be a very great disparity somewhere.

2734. **(Sir Alfred Bateman.)** You mean to say that exports from here are entered to Great Britain when no doubt they are going through to Germany; take wool, for instance?—I do not know what the reasons are, but the figures are practically useless.

2735. You know that they have been working for that object in England for years past, and they get considerable help by having the country of consignment given in the trade accounts. I think they have now two tables, and you ought to have the same thing here; I daresay you have noticed in our Second Interim Report* the same thing in connection with Australia. They cannot do much, however, without having a conference of statisticians?—Yes.

2736. **(Chairman.)** You speak also on weights and measures, do you not?—Yes; of course, we have a long way to go locally in regard to that matter. At present we have no general law for the whole of the country. We have pressed the Government a good many times to bring in a Bill to bring this about, but the Bill has never gone through yet. We have received correspondence from the Decimal Association to urge for a decimal system. But the position we have always taken up is this: when the Mother Country adopts it we will think about it. Of course, we have a system here under which our ton differs from yours. We take 2,000 lbs. as a ton and 100 lbs. as the cwt.

* [Cd. 7210.]

NATAL.

Durban, Monday, 23rd March, 1914.

Mr. ALEXANDER BUCHANAN, Chairman, and Mr. WALTER BUTCHER, Vice-Chairman, of the Durban Chamber of Commerce, called and examined.

(*For evidence of these witnesses on "General Trade Questions," see p.* 162 *and Appendix I., p.* 175; *and on "Ocean Freights," see p.* 78 *of* [Cd. 7706].)

2737. **(Chairman.)** Will you please read your memorandum in regard to weights and measures?—**(Mr. Buchanan.)** Yes.

The following memorandum was read by the witness:—

The question of legislating for the introduction of the metric or decimal system of weights and measures, as official and alternative or additional to the standards at present in use, and for securing uniformity in all Provinces of the South African Dominion, has for some time had the attention of Government. In the year 1910, and again in 1912, a draft Weights and Measures Bill was published, which provided for the concurrent use of the metric system and the Imperial standards of weights and measures. The draft Bill was fully discussed at the time by the Committee of the Chamber, and it was resolved to notify members of the Legislative Assembly representing the Durban constituencies "That this Chamber is, on grounds of general convenience, opposed to the compulsory use of the metric or any other improved system of weights and measures in South Africa before it is brought into general use in the Empire." Their attention was also drawn to the simplicity of the American methods of quoting all weights and measures in terms of pounds, feet, and gallons, all other terms being abandoned. Apart from the question of metric standard, it may interest your Commission to note that this draft Bill provides that all goods sold by weight shall be sold by nett weight, and that all goods sold in made-up packages or vessels shall have the nett weight or contents clearly marked on the package or container. The same ruling would, of course, apply to liquids sold by measure, and it is suggested that legislation to the same effect throughout the Empire would be advantageous. Unfortunately, circumstances have prevented further discussion of the Bill in our Parliament, but there is little doubt that it will be brought forward again at an early date.

2738. Those measures are in force in America, or proposed?—I believe in force.

2739. And you suggest their adoption in the Empire in preference to the metric system or independently of the question of the metric system?—Yes, independently.

2740. **(Mr. Lorimer.)** Is this a live question with you?—No. Our feeling is that we do not want the metric system introduced here until it is introduced in a compulsory manner throughout the British Empire.

2741. **(Chairman.)** I think that is in consonance with the view this Commission has adopted, that there was no use in going into this question in detail until action had been taken in the Mother Country?—Yes; we have here a very cosmopolitan population, and we think it is necessary in every way to maintain as many ties with the Mother Country as possible.

2742. **(Sir Alfred Bateman.)** I do not think you really mean to recommend the American system of weights and measures, do you, because they still have the Winchester bushel and the Winchester gallon, do they not?—We want to do away with these obsolete weights and measures.

2743. You want pounds; but do you want hundredweights and pounds?—We deal with pounds and multiples of pounds; you might sell, say, 100 lbs. or 1,000 lbs. We suggest the use of pounds and the disuse of tons, cwts., and quarters.

2744. I do not quite see the reference to American methods?—At present, for instance, in regard to tons,

you have the short ton of 2,000 lbs. in this country, and the ton of 2,240 in the Mother Country.

2745. In shipping you have the ton of 2,240 lbs., don't you?—Yes, in this country, and yet the articles that are bought and sold are by the ton of 2,000 lbs.

2746. **(Mr. Campbell.)** Do you use the same system of weights and measures throughout the Union? I notice in this Province you speak of acres, and in other Provinces of morgen, as a measure of area. And as a measure of capacity they use the muid in the Cape: do they use the same measures here, or the English system?—The draft Bill provides for the abolition of all these old measures. As regards the terms morgen and acres, it all depends on the terms used in the title deeds. In referring to a farm the title deeds of which speak of it as having an area of so many morgen you use the term morgen.

2747. But, generally speaking, among corporate bodies, do they use the acre or the morgen as a land measure?—In Natal the Government use the acre.

2748. Whereas in the Cape Colony they use the morgen?—Yes.

2749. Is the muid used here?—Yes.

2750. Generally?—Yes. In the case of whole mealies a muid is 203 lbs. gross or 200 nett. If you are dealing in crushed mealies the muid is 180 lbs.; if potatoes 150 lbs.

2751. Is not the muid also a wine measure?—I have not heard of that. The muid is a dry measure.

TRANSVAAL.

Pretoria, Monday, 30th March, 1914.

Mr. John Bruce Moffat, Director of Census and formerly Secretary of the Economic Commission, called and examined.

(*For evidence of this witness on "Animal and Agricultural Produce" see p.* 249 *of* [Cd. 7706].)

The following is an extract from a letter sent to the witness on March 20th, 1914:—

The questions on which the Commission would particularly like to hear your views may be summarised thus:—

1. As to the desirability of uniformity in statistics between the Mother Country and the Dominions.
2. As to the practicability of such uniformity from the South African point of view on the following matters:—
   - A. Record of countries of origin and consignment.
   - B. Classification of imports and exports.
   - C. Landed value of imports.
   - D. Valuation of exports.
   - E. Statistical system of weights and measures.

It has been suggested that the way to uniformity would be smoothed if a Conference of Statisticians of the Empire (and, possibly, Customs Officers) were to meet to consider such points as those enumerated above. What is your opinion on this, and as to the creation of a Central Statistical Bureau?

In reply, the following memorandum was furnished:—

The Secretary's letter dated 20th March only reached me on the evening of the 25th instant as I was leaving Capetown.

I have, therefore, not had time to go very deeply into the questions submitted.

My functions as Director of Census are at present limited mainly to arranging for and taking the quinquennial census in the Union.

I have no personal experience of the working of the Customs Statistical Bureau. My views on the several questions submitted are, therefore, those of an outsider, without practical knowledge of the methods adopted by the Customs Department in dealing with statistics of imports and exports.

Question 1.

The desirability of securing uniformity in statistics between the Mother Country and the Dominions in dealing with the matters referred to is obvious if the information collected and published is to be of any value for comparative purposes and for combination of the returns of the different Dominions.

Question 2.

As to the practicability of such uniformity from a South African point of view, as explained above I have no practical experience in these matters, and while, personally, I think that the difficulties in the way of securing uniformity ought not to be insuperable, I could not express an opinion of any value without a full acquaintance with the methods adopted by the Customs Department in dealing with the recording and classification of the details relating to imports and exports.

A conference of representatives of the Mother Country and of all the Dominions and Colonies would undoubtedly be the most satisfactory method of dealing with the question of securing uniformity not only in trade returns, but in statistics generally.

I would suggest that at such a conference each Dominion and Colony should arrange to be represented by delegates conversant with the collection of general statistics and by Customs officers.

The conference could divide its work into sections, say, roughly—

No. 1. To deal with population, vital statistics, and general statistics.

No. 2. To deal with statistics of production, such as agriculture, livestock, manufactures, mineral products, &c.

No. 3. To deal with trade.

No. 2 might be subdivided into (*a*) agriculture and livestock and (*b*) manufactures, mining products, &c.

Such a conference should be able to arrive at some satisfactory solution of the difficulty hitherto experienced in securing returns from all Dominions which can be compared and combined.

Instead of a central statistical bureau I think it would be preferable to arrange that each of the departments in England should act as a central bureau for its particular section.

Thus the Registrar-General's office in London should be the central authority to collect and publish population and vital statistics for the Empire, the Board of Agriculture to deal with agricultural and livestock statistics, and the Board of Trade to deal with trade returns and statistics of manufactures, &c.

2752. **(Chairman.)** You have been kind enough to answer certain questions which the Commission has put to you. In the first place you state that the desirability of securing uniformity between the Mother Country and the Dominions in dealing with the matters referred to is obvious if the information collected and published is to be of any value for comparative purposes and for combination of the returns of the different Dominions?—Yes.

2753. Have you anything to add to that. You say you desire to see uniformity established as rapidly as possible?—I think it ought to be.

2754. And your proposal in regard to the method of obtaining it is to have a conference between the

Customs and the Statistical Officers of the Mother Country and the Dominions, is it not?—Yes.

2755. Have you any special recommendations to make in regard to the conference?—Well, I would suggest that the Dominions should be represented by officers acquainted with statistics generally, and by Customs officers.

2756. You have also a suggestion to make, I think, in regard to the division of work of the conference into sections?—Yes, I think the conference could probably do its work more expeditiously if it divided the work into sections.

2757. The first sections deal with the population, vital statistics, and general statistics?—Yes.

2758. Secondly, dealing with statistics of production such as agricultural live stock, manufactures, and mineral products, and thirdly with trade?—Yes.

2759. Have you anything to add to that suggestion?—No.

2760. Then there is a further question on which you have given your opinion, that instead of a Central Statistical Bureau, it would be preferable to arrange that each of the departments in England should act as a Central Bureau for its particular section. Will you explain that point?—It seems to me that by having one Central Bureau dealing with all of them, they would overlap the various departments. For instance, the Board of Agriculture could deal much more efficiently with agricultural statistics on account of their expert knowledge, and the same with the Board of Trade.

2761. You rather decentralise statistical work into each of the technical departments?—Yes.

2762. **(Sir Alfred Bateman.)** I do not think we have much time, but I should like to have spoken to you about the deficiency of statistics in South Africa, and to ask what steps you are taking to remedy those deficiencies. How often is the Census taken?—Every five years. It is proposed that I should take over the collection of agricultural statistics, but we cannot do anything in this direction until we get an Act of Parliament.

2763. The statistics at the present time are purely voluntary?—Yes, but, of course, the Census ones are not voluntary.

2764. Is there a penalty?—Yes.

2765. How were the agricultural statistics taken?—Enumerators went round the country to the farms and either filled up the form themselves or got the farmer to do so. If the farmer could not fill it up himself, he gave the information to the enumerator and he filled it up.

2766. What is about the margin of error in those figures, a good deal, is it not?—I suppose the larger number would average out fairly closely in regard to live stock and production, but in regard to the acreage under cultivation I am not so sure. Very few farmers know exactly what land they have under cultivation.

2767. They do not know how many morgen?—No.

2768. But they fill in something?—Yes. My proposal is to work on the basis of the quantity of seed sown in future. We can tell from each district what the average quantity sown per morgen is, and calculate the acreage accordingly.

2769. I have been looking over your pamphlet in regard to the proposed scheme of agricultural statistics, and I think you are going on the right lines. You have evidently studied the American system as well as the English system?—Yes.

2770. This will be a very excellent scheme when it comes about. Now, in regard to other statistics as to labour and prices, what do you propose to do there?—That only refers to agricultural statistics, but I may say that I have drafted a Bill which is at Cape Town, and of which I can let you have a copy. I have not yet got it as finally approved. That Bill covers all statistics.

2771. I have been simply thirsting for statistics ever since I came to this country. Wherever we have been they have told us there is only the Census, and that is said not to be accurate, but you propose, I understand, to get statistics in regard to other branches?—Yes. The Bill gives power to collect all kinds of statistics, produce, manufacturing, labour, and so on.

2772. On the general question that was asked of you in regard to a statistical conference, you make certain suggestions?—Yes.

2773. You do not want an Imperial Department in London, or an Imperial Commission to deal with statistics, but you want to divide them up very much as they are done now?—Yes.

2773A. That is to say, our Registrar-General in London should deal with statistics so far as births and deaths are concerned?—Yes, and population.

2774. And the Board of Agriculture should take over all agricultural statistics of the Empire?—Yes.

2775. And the Board of Trade. You say nothing about labour statistics?—I am not sure, but I think the Board of Trade deals with those.

2776. They do. You have made very good use of them in the excellent report of the Economic Commission, and you evidently know where these things come from?—Yes, I suppose they do deal with them now.

2777. But you are against a Central Bureau?—I do not see any particular object in having a separate Central Statistical Office.

2778. A Central Statistical Department for the Empire?—No, I think it better for each department to deal with its own.

2779. But you tack some further work on to the Board of Trade. They have already compiled a good deal of statistical information for the Empire, and you would make them do a little more?—Yes, if the Dominions combined they could be made more complete.

2780. Are you of opinion that the labours of the proposed Conference would be helped very much by appointing one or two people previously to work on the subject and bring out the essential points by correspondence between the Dominions, so as to get a preliminary agreement on the main lines?—Yes, that would save a great deal of work when the Conference met.

2781. You would have that, and you would divide the Conference into several sections?—Yes.

2782. If this preliminary work were done and the Conference were divided into sections there is no reason why in a moderate time, perhaps a few weeks, you should not complete it?—Yes, if the thing was properly threshed out beforehand.

2783. But if you all simply met together with no programme arranged mutually, it would take a long time?—That is so.

2784. And so far as this Government is concerned you seem inclined to improve your statistics to a very large extent?—Yes.

2785. What is your present staff in the Census Office?—I have five clerks. Since the Census the Government asked me to collect statistics from all Departments. I publish them in a Year Book somewhat on the lines of the Australian Year Book, and we have being doing that during the last year.

2786. You have not got the book out yet, have you?—No. We have had great difficulty in getting returns from the different Departments.

2787. Does each Department stick to its own statistics?—Yes.

2788. Have you difficulty in getting trade statistics from the Customs Departments?—Well, we simply take their Annual Book and extract the information we require.

2789. But to bring the book out quickly you should have returns from them before they are published in the ordinary way?—Yes. We generally do get them before the return comes out.

2790. Have you any system of getting into consultation with the officers of the Customs as to forms and the information they get?—No. Just before Union an Inter-Colonial Commission sat and drew up forms and returns for everything—trade, agriculture, and every branch of statistics, and when I was asked to undertake this work and make up this book, we sent these forms to the Departments concerned and we said, "That is what is wanted." But very few were able to give the information. Some of the forms were impracticable and useless.

2791. They did not give anything?—We got returns from them as far as they could give them.

2792. Will your annual volume be on the lines of Mr. Knibbs's excellent work in Australia?—I have taken that as an example.

2793. But will it be on the lines of the Board of Trade publication, which consists strictly of

figures?—I have not attempted to give any letterpress. I have simply given tables.

2794. Then it is more on the Board of Trade lines. You do not, practically, have any descriptive matter?—No.

2795. Are you familiar with the American statistics?—I went to Washington last year and looked into their system of agricultural statistics.

2796. And what did you think of them?—They are very good. Their statistics are only estimates, they do not attempt any enumeration except the Census.

2797. In your agricultural statistics, as regards the condition of crops, shall you try to be numerical or only descriptive?—I only propose to take a percentage.

2798. You will take 100 as normal?—Yes, I was going to take 100 as normal and ask my correspondents to take that figure as normal.

2799. Shall you have any difficulty in getting local correspondents?—Well, I have sent circulars out to many local men and a good number of them will have no objection to do the work. Some of them want to be paid, however.

2800. Is there any system of payment for this kind of work. I believe that in America, for instance, they make presents to these local people of copies of the Blue Books and other information?—There is no system of payment here at present for this kind of work, but a certain number of people will do it, I think.

Johannesburg, Friday, 3rd April, 1914.

Mr. Howard Wallace Soutter, Mr. Alfred Falkland Robinson, and Mr. Ernest Chappell, J.P., representing the Johannesburg Chamber of Commerce, called and examined.

(*For evidence of these witnesses on "Migration, Land Settlement, and Irrigation," see p.* 46, *on "Posts, Telegraphs, and Steamships," p.* 81; *on "Bills of Lading," p.* 91; *on "Railways, Harbours and Coal for Bunkering and Shipment," p.* 140, *and on "Empire Development," p.* 161 *of* [Cd. 7706]; *and on "Exhibitions," see p.* 124, *on "General Trade Questions," p.* 173, *and on "Legislation," p.* 183 *of this volume.*

The following statement as to improvements in statistical methods was furnished to the Commission in a letter from the Johannesburg Chamber of Commerce, dated February 4th:—

The Chambers of Commerce of South Africa have, for several years, urged on the Government the great need which exists here for a properly organised Statistical Department, and in this connection has pointed out what is done in Australia and Canada.

The Chamber is strongly in favour of the proposal which it is understood has been made to your Commission, viz., that statistics as to production, trade, shipping, labour, &c., should be prepared on a uniform basis in the United Kingdom and all the self-governing Dominions; and that the information, besides being published locally, should be forwarded by each Dominion to a Central Office in London, where the whole would be collated and published in a form which would facilitate comparisons.

and Mr. Soutter read the following additional memorandum:—

Improvement of Statistical Methods. — We believe that the Premier, General Botha, has felt the importance of an improvement in the Statistical Department, and that the Government sought expert advice and are establishing a Statistical Department which, we understand, will be under the management of the Secretary of the Economic Commission which sat here last year.

At the present time, there are the statistics from the Mines Department and the Railway and Customs Departments, but we have no full and reliable statistics as to production, trade, shipping, and labour, and we should suggest that a permanent office of statistics be established in the Union, which would obtain adequate and reliable information, as far as the Union of South Africa is concerned, and that this information should be on a uniform basis with that of the United Kingdom and of the self-governing Dominions. We further suggest that this information should be collated in a central office in London, and published in a form which would facilitate comparison.

2801. **(Mr. Sinclair.)** You support the views that have been put before this Commission in different directions for a uniform basis of statistics so far as it is possible to collate them?—(*Mr. Chappell.*) Yes; it would be of great advantage.

2802. **(Sir Alfred Bateman.)** You comment very rightly on the want of statistics here, but I have seen Mr. Moffat, and I think you are going to have considerable improvement in that direction in the future. There are schemes under consideration and likely to be adopted which will improve your statistics immensely?—(*Mr. Soutter.*) What we are rather anxious about is that the new department should be on a proper basis, so that the figures from the various parts of the Union can be easily collated in a central office, so that the particulars can be arranged on as sound a basis and in as simple a form as possible for comparison.

2803. I do not know whether you have considered the proposal which was made to us in Australia that there should be a conference at home in a year or so of the statisticians of the different Dominions so as to get nearer to uniformity?—I think that would be excellent.

2804. Then you would have the advantage of starting your statistical bureau on up-to-date lines, and you would be in close uniformity with the rest of the Empire?—Yes, which is necessary.

2805. You do not contemplate that your statistics should go home to be published—you would have your own Year Book?—Yes, but it might be possible for a central office in London to collate those statistics from the Dominions and publish them.

2806. It is done to a certain extent by the Board of Trade now, only it might be done better, possibly, if there were in existence an executive committee such as you propose of the Imperial Conference. But the worst of bringing everything together before you publish it is that you go the pace of the slowest Dominion. So, I think, it was contemplated you should have your own Year Book and only abstracts should be published in England on the same uniform basis: do you think that would be desirable?—Yes.

[*See also Sir R. S. Holland, Q.* 2909, *p.* 140.]

(c) General Trade Questions.

CAPE OF GOOD HOPE.

Cape Town, Monday, 2nd March, 1914.

Sir Reginald Sothern Holland, His Majesty's Trade Commissioner in South Africa, called and examined.

2807. **(Sir Alfred Bateman.)** I think you have been in your present post 5½ years?—Yes.

2808. Before that you had South African experience?—Yes, I was in the public service of the Cape of Good Hope for a period of some 17 years.

2809. And you have been Private Secretary to Sir Gordon Sprigg during his Premiership and to Sir Starr Jameson when he was Prime Minister?—Yes.

2810. You have prepared a very excellent report with a view to the Commission coming out here. Several members have expressed to me their appreciation of the way in which this report* was compiled, and I think that I may say on my own behalf also that we consider it a very valuable document and one that will help us very much.

First of all as to the alien population. I do not know whether we shall be able to get much help from figures, but is it a fact that the coloured population is increasing faster than the white?—Yes; according to the calculations based on the last Census report.

2811. It would also appear that recent departures from this country exceed the arrivals?—I do not know how far the figures can be accepted as entirely reliable.

2812. At the bottom of page 4 you give these revised figures, comparing the Census for 1904 and 1911, and allowing for the circumstances under which the Census was taken in 1904, the European population, exclusive of the Native Protectorates, shows an increase of 15·86 per cent. and the Native 14·19 per cent. That would show a larger increase in the case of the whites?—Yes, but that result takes into consideration certain factors, the most important being the return to East Africa of labourers from the mines. If you leave out these figures, the Indian immigrant population and the reduction of the garrison, that is the result arrived at.

2813. There is nothing to help us as regards births and deaths. I suppose there are no such figures in regard to the Native Reserves?—I cannot say definitely, but I think some figures are available.

2814. Passing to the collection of statistics concerning agricultural development, do you happen to know whether this has been a compulsory or voluntary result?—Voluntary, but I may mention, for the information of the Commission, that the Government has recently decided on a systematic collection of agricultural statistics which will provide information which we have not had hitherto, the most important data required being in connection with native-grown crops, such as maize, which has recently had to be brought from Europe after exportation from South Africa. Instances of that sort will be obviated by a proper forecast of agricultural crops.

2815. You draw attention to the need of having proper statistics?—Yes, on page 7.

2816. You have had difficulty also with your trade figures?—Yes. The Customs Department, for purely financial reasons, I understand, decided upon the withdrawal of a table which was of the utmost value to us. That table gave the total value of imports under categories from each country into British South Africa, treated as a statistical unit. Other tables cover imports into the Union and Rhodesia shown separately, but as they take no account of re-exports from one part of the country to another the information required cannot be arrived at.

2817. Taking the imports into account, you draw attention to the decline in mining and electrical goods, and you rightly say that comparing one year with another is not much of a guide?—No.

2818. Because there has been a great conversion of power on the Rand, has there not?—Yes. The conversion has been from steam to electric drive on all mines. In the case of some groups they have their own independent plant, for instance, the Robinson and the Farrar Anglo-French groups, but other groups depend on the Victoria Falls Company for electric power supply.

2819. The thing that strikes one is the large amount of Drugs and Chemicals, on page 17, which has risen from 490,000*l.* to 572,000*l.* last year. Is that not a very large figure?—I think, if you examine the report in respect of other classes of imports, you will find equally large increases.

2820. I suppose this cannot be regarded as such a large drug-taking population?—I am afraid it is. People swallow far more than is good for them.

2821. Now, passing to page 19, Imports of general merchandise from the United Kingdom. That does not show a large change in the percentage?—No; as a matter of fact, in 1912 there was a very slight fall, but that, to my mind, is accounted for by the drought. There is a similar effect on the figures for 1913, but more pronounced, if anything. I might explain that during a period of drought the country has to import a larger proportion of foodstuffs, and these come from other Dominions, chiefly Australia and Canada. That, of course, swells the importations of these countries and it affects the importations from the United Kingdom, because South Africa then has less to spend on manufactured articles; the imports from Great Britain being essentially manufactured articles.

2822. In that table do you leave out goods which are not in competition, and which are supplied by other countries?—No. That table takes account of all imports. If we eliminated non-competitive goods, we should show a very different result. I think it is generally admitted that in competitive trades we are more than holding our own. There are certain branches which might be improved.

2823. Now, passing on to your special work. Of course, we know that the number of letters received is not necessarily a good guide, but still it is a rough guide as to the progress of your Department. In five years your letters have been increased from 1,363 to 3,213?—Yes; that is incoming letters.

2824. And the outgoing letters are rather more than double?—Yes. As you say, I do not think the actual amount of correspondence is a true indication of the volume or the value of work done. I have made a special effort not only to serve the interests of manufacturers on the other side, but to be of some use locally, and by so doing it has served a dual purpose. Information has been accumulated in my office which is of real benefit to people in the Union itself, and I find that as time goes on the office is being made more and more use of, not only by people in the trade, but frequently I receive enquiries from Government Departments for information, and I think the office is becoming firmly established.

2825. Are you in touch with all the Government Departments here?—Yes. I receive most cordial

* [Cd. 7023].

support from all Departments of the Union Government.

2826. And I think there is a note also that you have a good many oversea firms in touch with you—1,400?—Yes. I have actually rendered some service or other to 1,400 individual manufacturing firms. I mean British manufacturing firms who have required some assistance in their trade dealings with South Africa.

2827. And you are keeping in touch with the agents of British firms over here?—Yes. I make a point of doing so. One of the greatest services which a Trade Commissioner can render to a manufacturer is to guide him in matters of local representation. Owing to the pressure of foreign competition, and the representation of foreign firms in oversea markets, it becomes necessary for British firms to have direct or indirect representation.

2828. You do not believe in catalogues distributed broadcast being enough? No. I think catalogues are not sufficient, and I have provided a permanent bureau for the filing of catalogues of British firms. These catalogues are always accessible to local merchants and others.

2829. How about the merchants here? Do they support you?—Yes. Without the support of merchants here, one would be helpless. I have invariably received the most cordial support and assistance from merchants in all parts of the Union.

2830. How are you able to look after Johannesburg, which is 1,000 miles off?—I might explain that when the Commercial Intelligence Department of the Board of Trade first started to organise the work on behalf of British interests in oversea Dominions, they appointed what were termed "Imperial Trade Correspondents." These appointments were carried on, and the services of these correspondents have been most valuable, though more particularly in the past, before Commissioners were appointed. At the present time we have an Imperial Trade Correspondent at Johannesburg and at four other centres. Whether the system will be continued or not I am not prepared to say. At the present time all enquiries that cannot be dealt with here are referred to Johannesburg, or whatever centre is concerned. I may say that it has been my practice in the past to tour South Africa at least twice a year, and a good deal of work is put in when I happen to be at these centres.

2831. How much time does that take?—It depends on the length of time I stay in each place. I should say that at least three months a year is taken up in travelling in South Africa.

2832. You have also to go to England pretty often?—Every two years.

2833. You want to draw attention to one or two cases in which the Commission received evidence in London?—Yes. I think it is advisable that the Commission should receive evidence on one or two points.

I should like first to refer to some evidence given before the Commission by Mr. Speakman in London, on behalf of the Manchester Chamber of Commerce. On page 186 of Part II. of the Minutes of Evidence first taken in London [Cd. 6517], he said:—"The Manchester Chamber of Commerce are of opinion that the time allowed to British firms for the preparation and forwarding of tenders for Colonial Government contracts is, in many instances, quite inadequate." Instances were given in support of this statement, and the Manchester Chamber finally expressed the ". . . hope that the Commission will report in favour of the granting of adequate time to British contractors, in all cases when British tenders are invited."

The attitude of the Manchester Chamber of Commerce is one commonly entertained by manufacturers in different parts of the United Kingdom, but it opens up very contentious ground, and I think it necessary that the Commission should be in possession of the reasons which render it unlikely, in my opinion, that a modification of the present system will be brought about.

The question of urging upon public departments and local bodies the desirability of extending the periods fixed for the receipt of tenders, in order to afford home firms the desired opportunity to participate, has engaged my constant attention. Arrangements have been concluded with all Government departments, and the principal municipalities, &c., whereby particulars of any important tenders are at once communicated to the Trade Commissioner's Office. These particulars are immediately transmitted to the Board of Trade by letter or by cable, as circumstances require, provided always that sufficient time is allowed to enable home firms to tender. A copy of the specification, drawings, &c., invariably follows by the earliest opportunity for the guidance of firms not represented in the South African market.

By the arrangements thus made the Board of Trade are kept posted with complete details of all important public contracts open to tender, but no amount of organization can possibly assist home firms not represented in the South African market with regard to the large bulk of every-day orders placed with local merchants for reasons of expediency as well as of policy.

To emphasise the great pressure brought to bear on the Government by local merchants against the purchase of goods oversea, I submit, for the information of the Commission, the following extract taken from the Minutes of the last meeting (January, 1914) of the Johannesburg Chamber of Commerce, which should prove of special interest in view of the representations of the Manchester Chamber of Commerce.

"Your Committee has addressed the following representations to the Prime Minister in connection with the Office of the High Commissioner in London, viz.:—

> "'I have the honour, by your direction, to refer to the vacancy which now exists in the above office owing to the lamented death of Sir Richard Solomon.
>
> "'My Committee desires, in the first place, to endorse the views which it is understood the South African National Union have submitted as to the desirability of appointing to the office someone who will see that this country's productions and capabilities are well advertised in England.
>
> "'My Chamber would, however, further submit that the time is now opportune for carrying into effect an alteration in regard to the purchasing of supplies for the several Government Departments of the Union and of the South African railways.
>
> "'The Johannesburg and other Chambers have for several years represented the desirability of placing contracts for Government Departments with South African firms instead of through the High Commissioner; and the Association of Chambers of Commerce of South Africa has at its annual congresses passed resolutions asking "that in the general interests of South Africa the present methods of purchasing supplies for Government Departments should be revised and the necessary supplies obtained by tender through South African merchants or agents."
>
> "'In pressing this recommendation, the Chamber considers it unnecessary to explain in detail the advantages which would accrue to the country if orders were placed with South African firms. The latter have sunk large sums of capital here, they are considerable tax-payers, and employ a large number of persons. To increase their trade, therefore, is to proportionately add to these contributions to economic progress.
>
> "'As you are aware, during the period of Crown Colony Government supplies were obtained through the Crown Agents, and the consequent disadvantages were notorious. Frequently, goods were not bought at the lowest prices available, and in other instances goods purchased were found on arrival to be unsuitable, besides which, owing to delays, some departments were led to order too heavily on account of the uncertainty as to delivery. As is well known, large surplus stocks accumulated and had to be disposed of at much below cost. It is admitted that steps have been taken in recent years to remove some of the disadvantages under which firms here suffered in competing with oversea firms for Government requirements; but it is contended that further action in this direction could be taken with advantage to this country.

"'My Chamber is informed that the supplies for the Government Departments and Railways of Australia and Canada are obtained through the merchants of those countries. I am, moreover, to point out that the gold-mining industry finds it advantageous to obtain practically all its requirements through South African merchants, and millions of pounds per annum are thus circulated in this country.

"'The Chamber considers that the best interests of the country would be served if the commercial department of the High Commissioner's Office were abolished so far as the purchasing of requirements and placing of orders is concerned, but it recognises that arrangements for the inspection of material should be retained.

"'As to the effects of such a change, I am to point out that if the Government obtains its supplies through South African merchants the very keen competition which exists here would, without doubt, ensure prices being quoted which would compare favourably with any quotations which the High Commissioner's Office would obtain, when allowance is made for the saving of present expenses in connection therewith. Merchants and agents here are prepared to supply from stocks or to indent for all requirements; and to be held responsible, right up to the time of delivery, for goods being of the specified quality and description, as well as for the fulfilment of specifications. The Government would have responsible persons on the spot on whom they could place the onus of any delays or defaults that might arise. It is contended that some charges now paid could thus be saved to the Government, and it is evident that any trade profits and necessary expenditure in connection with contracts would then be circulated in this country, and the benefit would accrue to the general community.'"

Thus, it is seen that the Manchester Chamber of Commerce's proposal introduces a somewhat delicate question of Colonial policy.

I might inform the Commission that, in order that British firms might be in possession of an official statement as to the precise conditions governing the purchase of Government supplies in South Africa, a memorandum setting out the system of purchases was submitted by me to the Board of Trade, and the particulars embodied in this memorandum were subsequently printed and widely distributed for the guidance of British firms in the United Kingdom. This document is in the nature of a "Confidential" paper, but a copy will be submitted privately for the information of the Commission if it so desires.

If asked how manufacturers could best meet the difficulties of the position as pointed out by the Manchester Chamber of Commerce, I would at once say that they can secure all the opportunities they desire and obtain equal treatment with South African firms by the simple means of acquiring properly constituted local representation. The reason why South African firms are increasingly able to tender for local requirements is due principally to the fact that they are acting more and more as the direct agents of oversea manufacturing concerns in addition to conducting their own business as ordinary merchants.

Experience in this market proves to my satisfaction that orders lost to oversea firms are in most cases due to the absence of efficient local representation. To my mind properly constituted representation is the fundamental basis of successful trading. There is no doubt that the pressure of foreign competition and the representation of foreign firms in oversea markets is forcing British manufacturers, more and more, to go beyond the legitimate fields of manufacturing by systematically aiding in the merchanting of their own goods in the markets of the world.

Manufacturers who still wait for orders to reach them through London buying houses or direct from oversea markets are working on wrong lines. Their representatives must be in the oversea markets to create the demand for their goods, to be continually on the outlook for new openings for trade, for changes of pattern or design, changes of fashion, and, above all, to obtain details of prices, and, if necessary, samples of their competitors' goods.

The form which representation should take varies according to the character of the goods and the demand that exists. A memorandum comprehensively dealing with this question was specially prepared by me as a guide to British firms dealing with this market, and a copy of this memorandum might also be "put in" for the confidential information of the Commission should it so desire.

It is upon this question of oversea representation that I have largely concentrated my efforts to promote British trade in South Africa.

2834. Some years ago this was brought before the Shipping Rings Commission in Johannesburg.—Yes. That touches the question of direct trading. In regard to this, while I personally would, of course, like to see the present system of placing orders in London continued wherever possible, one has to make allowance for those who claim that South African merchants should be given equal opportunity, and I think, therefore, it is of great importance that British firms should take steps to overcome the disadvantage of not being on the spot to tender. The best way to attain that purpose is to place their interests in the keeping of some local firm, which would tender on their behalf.

2835. It comes to this, that you do not think it is enough even if you cable when there is short notice to tender?—No, because the manufacturer does not see the specification, drawings, and other necessary details.

2836. So the big firm should have its agents?—Yes. Firms that want to do a permanent business should take means to get local representation.

2837. You have also a note as to the Commercial Information Bureau which the Royal Colonial Institute seems to be setting up, somewhat on the lines of what we have in London and you have here?—Yes. Mr. Jebb, giving evidence in London on behalf of the Royal Colonial Institute (page 93 of Cd. 6517), put in the following statement:—

"The Committee" (of the Royal Colonial Institute) "assume that, in accordance with the resolution as originally drafted by the Canadian Government, and accepted subject to Mr. Harcourt's proviso, the Commissioners will embody in their report a compendium of information respecting the natural resources, trade, &c., of the Dominions. The Committee feel, however, that for all large purposes of State policy in connection with Empire trade, sufficient information is already provided by the various reports which are made from time to time—on the one hand by or for the Departments of the Dominion Governments, and, on the other hand, by the British Trade Commissioners resident in the Dominions." Having given expression to the above views, Mr. Jebb, on behalf of the Trade and Industry Committee of the Royal Colonial Institute, dealt with other matters having a direct bearing on the need for Imperial co-operation and centralisation, particularly with regard to the establishment of an Empire-development Fund and Board, and it is interesting to note that, in cross-examination, Mr. Jebb incidentally admitted that, in his opinion, there is a disadvantage in multiplying bodies unnecessarily.

It would appear, from the above remarks, that the governing body of the Royal Colonial Institute considered that, on the one hand, the Board of Trade, and, on the other, the Dominion Governments, maintained sufficiently well-organised Departments for providing the necessary information in connection with Empire trade.

The above evidence is, therefore, difficult to reconcile with the recent action of the Institute in setting up a Commercial Information Bureau, whose activities, in effect, will be to compete with the official organisation of the Board of Trade. Even if this is not the intention of the Royal Colonial Institute, there can be no doubt that the letter addressed by the Institute to public bodies in the Oversea Dominions is open to that construction, or, in other words, its contents cast a reflection on the efficiency of the

existing official organisation. One paragraph of the letter referred to reads as follows:—

"It is felt that, owing to the keen commercial rivalry of foreign nations, and their extensive Consular service, which they use commercially in order to assist their own manufacturers to make the fullest use of opportunities for trade in the British Empire, some special effort should be made to give our own manufacturers an equal service of trade information."

Now in order that the similarity of the aims of the Information Bureau which it is thus intended to establish may be compared with the general scope of the work of the Commercial Intelligence Branch of the Board of Trade, I submit, for the information of the Commission, the following copy of the letter addressed by the Secretary of the Royal Colonial Institute to the Chamber of Commerce at Cape Town and at other centres:—

"I am directed by the Council to enclose a copy of a pamphlet issued by the Trade and Industry Committee of this Institute, and to say that, in view of the importance of the subjects outlined in the pamphlet, they would be pleased if you would place their subjoined request before your Council.

"It is felt that, owing to the keen commercial rivalry of foreign nations, and their extensive Consular service, which they use commercially in order to assist their own manufacturers to make the fullest use of opportunities for trade in the British Empire, some special effort should be made to give our own manufacturers an equal service of trade information.

"This was one consideration which induced the Council of the Institute to establish an Information Bureau with the purposes in view hereunder:—

> "To deal with all enquiries made personally or by letter to the Institute, and also to distribute information concerning the resources and opportunities for trade and Imperial expansion which now exist.

"In order to carry out these objects I now wish to enquire whether your Council would be prepared to furnish periodically to the Institute, addressed to the 'Information Bureau,' the following:—

"(*a*) Published literature dealing with your city, its activities, and its possibilities, both from a commercial and industrial view-point, and also what is considered its advantages as a visiting place for Empire travellers.

"(*b*) The earliest notification possible of those of your Council's resolutions entailing expenditure for works for which tenders might be invited either locally or through a London representative.

"(*c*) As a corollary of (*b*) such tender forms and specifications of such works as would enable the Institute to place before United Kingdom manufacturers your city's specified requirements.

"(*d*) Any other information which your Council may care to furnish—always with the view to the increase of inter-Empire trade.

"Regarding (*c*) arrangements are being made to communicate immediately to British manufacturers in the trade concerned the particulars thus received.

"My Council will greatly appreciate your active interest in this matter, and I am to add that this Bureau will always be pleased to give you any information that you may desire concerning market and other conditions in the United Kingdom."

A copy of the above letter was duly referred to me by the Secretary of the Capetown Chamber of Commerce, who wrote as follows:—

"I am directed to send you the enclosed copy of a letter received from the Royal Colonial Institute, asking for certain information and literature relating to the trade, industries and attractions of this district of South Africa.

"This Chamber is of opinion that the requests therein contained can be suitably dealt with by you, and I am therefore instructed to send a copy of the communication to you, for your consideration."

In considering the action of those responsible for this new departure on the part of the Royal Colonial Institute, it may, of course, be claimed that a duplication of effort to promote Imperial trade is a good thing, and should be encouraged. But, on the contrary, I think that experience will show that the establishment of an independent Bureau which seeks the co-operation of public bodies and institutions in Dominion markets in matters which are already engaging their attention on behalf of the Board of Trade is likely to have a directly contrary effect. To ask the same bodies to supply identical information to two recipients for the same object is, surely, an unnecessary duplication of work.

Apart from these considerations, it is obvious that the more that manufacturers in the home market are familiarised with the work of the Commercial Intelligence Branch of the Board of Trade, and the more that Department is recognised as the fountain-source of all information affecting Empire trade, the wider will its influence become, and the greater use will it be able to make of the material supplied to it by its oversea officers.

On the other hand, it cannot be denied, I think, that the influence exercised in the past by the Royal Colonial Institute with regard to Empire matters has lain in its missionary work, *i.e.*, in its efforts to inculcate and spread the doctrine of Imperialism, and by urging the need for concerted action as well as by supporting official endeavour in that direction.

It is because I believe that the policy of setting up the independent Institution, now suggested, is calculated to confuse, rather than to assist, British manufacturers, and generally to weaken rather than to strengthen official endeavour in the furtherance of British trade interests in the Dominions, that I venture to bring this matter to the notice of the Commission.

2838. Have you anything to add to this note?—I think it is a very great pity that they should have taken this step. I have quoted a letter that they have addressed to public bodies in the Union, which can only be interpreted as a reflection on the efficiency of the Board of Trade organisation. I do not believe it possible that the Royal Colonial Institute (not being an official body) can set up an organisation that would in any sense be more efficient, and the fact that they are competing in a certain way with the Board of Trade must lead to confusion and, I think, to bad results.

2839. You mean that if these Chambers of Commerce are approached by two different bodies for the same information they will get rather tired?—Yes, it will cause great annoyance.

2840. And the Board of Trade Intelligence Branch may suffer?—Yes, because in the interests of British trade the Board of Trade has a system whereby valuable information only reaches the hands of purely British manufacturers. There are a great number of Continental firms which have their head offices in London, and if the information is imparted to them they at once communicate it to their works. I may be quite wrong, but I doubt whether the Royal Colonial Institute can or will discriminate to the extent that the Board of Trade has found it necessary to do in the interests of British manufacturers.

2841. Your immediate criticism is that the bodies out here do not like the trouble of being applied to by a second body?—I interpret it as being so, in view of the fact that the Cape Town Chamber of Commerce immediately passed this letter over to me and said that they did so because the matter could no doubt be suitably dealt with by me. They assumed that the Trade Commissioner was the proper person to keep British manufacturers posted. May I refer to one paragraph of the letter which the Royal Colonial Institute addressed to public bodies? It reads as follows:—"It is felt that, owing to the keen commercial rivalry of foreign nations, and their extensive Consular service, which they use to assist their own manufacturers, some special effort should be made to give our own manufacturers an equal service of trade information." That can have only one interpretation.

2842. Will you read us the note you have prepared as to the systematic collection of samples of foreign goods?—Mr. E. Wright, Secretary of the Birmingham Chamber of Commerce, giving evidence in London (page 286 of [Cd. 6517]), recommended on behalf of the Chamber "That there should be a regular and systematic collection of samples of goods which are sold in the Colonies in competition with similar

articles of British origin; that these samples should be accompanied by the fullest details as to

Wholesale and retail prices,
Customs duties,
Freight rates, &c.,

and that such samples should systematically be exhibited in the Chamber of Commerce of the principal industrial centres of the country." The policy advocated above has now definitely been adopted by the Board of Trade, as was recently announced in the Board of Trade Journal in connection with a collection of samples of Continental earthenware and glassware forwarded from the South African market. The official notice in the Journal stated that ". . . the collection and exhibition of these samples (of earthenware and glassware) by the Board of Trade is *part of a general policy* which was recently inaugurated of placing before manufacturers actual samples of foreign goods which compete with United Kingdom goods in the Oversea Dominions, or the like of which, made in the United Kingdom, have not hitherto been sold in these Dominions, with full details as to prices, freights, Customs duties, &c. Results show that these exhibitions have aroused considerable interest on the part of manufacturers here, and have also been of much practical value."

I may state that, as far as the South African market is concerned, the matter of forwarding samples is not a new departure, though it was not till 1912 that a comprehensive collection covering a specific trade was authorized. The instructions originally issued to Trade Commissioners dealt with this subject, and as far back as the year 1909 I brought samples of foreign goods to the notice of British firms, with encouraging results. The practice has been continued ever since.

During 1913 three lots of samples were furnished to the Board of Trade as part of the general policy above referred to, and I am now engaged in forwarding a further range of samples of certain Continental goods which have recently been introduced successfully to this market. A Commissioner's efforts in this connection, however, are dependent to a large extent on the amount of funds at his disposal.

2843. Please go on to the notes you have drawn up as to foreign competition in enamelled ware and misrepresentation.—On the question of foreign competition I noticed that in the course of the evidence given by Mr. S. Machin on behalf of the London Chamber of Commerce, a good deal of discussion centred on the question whether certain enamelled ware, included in the exhibit of samples of foreign goods, was of *British* or of *German* origin, and the general question of British *versus* foreign competition in this line was discussed by Mr. James Park in New Zealand.

On page 3 of the London evidence [Cd. 6517], Mr. Machin stated:—

"One advantage of these Exhibitions" (*i.e.*, of samples of competing foreign goods) "is that they afford a means of detecting goods which are sold as *British* to Colonial customers, when actually they are of foreign origin. For example, a quantity of the enamelware displayed at the recent exhibition was alleged to be partly of British manufacture, that is to say, the steel bases were known to have been made in Great Britain, the enamelling and finishing having been done in Germany."

Later (page 8), Mr. Machin was cross-examined by Mr. Lorimer, and is reported as follows:—

"The bases of this manufacture were steel-plates. Do you happen to know whether it was simply the steel-plates that were made in England and whether the work of shaping them into the form of the enamelled ware was done in Germany, or whether it was simply the enamelling that was done in Germany?"—"I could not answer that question conclusively, but I am informed that only the enamelling was done in Germany, that the steel and the shaping of the steel of the bases was done in England, and the enamelling only was done in Germany."

"That involved sending the shaped articles to Germany to be enamelled there, and then having them sent back?"—"They were sent to the Colonies. These are samples collected in the Colonies of *German goods* . . . (They were) not sent back to England; they were collected by the (British Trade) Commissioner and sent to us as an example of *German* manufacture."

For further evidence *re* enamelware *see* page 109 of Evidence in New Zealand [Cd. 7170], given by Mr. James Park, cross-questioned by Mr. Lorimer and other members of the Commission:—

"With regard to enamelled hollow-ware, such as basins, pie-dishes, and that kind of thing, we were told in London that while the goods were made in England they were sent to Germany for enamelling. Is that done in your case?"—"No. I think that has been done away with. The Welsh Tin and Plate Co. (*sic*) have imported a number of German enamellers to do their work."

"So that the enamelling is completed in Great Britain now?"—"Yes."

"So that you are comparing the prices of enamelled goods finished in Great Britain with the prices of the same articles in Germany?"—"Yes."

"And the Germans are cheaper, apart from freights?"—"The Germans are very much lower. They are about equal if you take into consideration the difference in the duty. But then we get a much quicker delivery from Germany. They can turn out their stuff so much more promptly. Not many months ago, we transferred orders from the Welsh Company to Germany, because the delivery of the Welsh Company was not quick enough for us."

"Where were the goods being made—in Wales?"—"In Llanelly." . . . .

"It is much more serious to learn that the prices are so much lower in Germany, so much so that it requires the whole of the duty to put them on an equal footing?"—"Yes. I should mention that the quality of the German enamelling is superior to the Welsh. The enamelling is not so brittle." &c., &c.

The above evidence embodies several important statements which, if allowed to pass unnoticed, are calculated to give rise to misconceptions and to be prejudicial to British trade interests.

In the first place, I do not follow Mr. Machin's argument, apropos of the recent Foreign Hardware Exhibition, when he says:—

". . . One advantage of these exhibitions is that they afford a means of detecting goods which are sold as 'British' to Colonial customers, when actually they are of foreign origin."

The goods in question were a collection of samples of foreign-made articles sold in South Africa as such, but not as "British." It therefore would seem to me that Mr. Machin's evidence was wrongly reported, especially as he admitted in a later portion of his evidence that—

". . . they were collected by the Trade Commissioner and sent to us as an example of German manufacture."

It is possible, of course, that the allegation made by some person in England, who inspected the samples, to the effect that some article or other was partly of British make, might have been interpreted as an allegation made by the *seller* in South Africa. In any case I think it unnecessary for the Commission to attach any special importance to this question of alleged misrepresentation. The collection of enamelled ware happened to be a very comprehensive one, and it is possible that a particular dish or other article of a British firm was included by accident, though I am not prepared to admit this to be the case.

There is certainly no justification for the supposition that British-made enamelled ware was being sold in the South African market as foreign, or *vice versâ*.

On the general question of British competition in these goods I should like to state, for the information of the Commission, that a great change has come over the position during the last year or two, and I entertain high hopes for the future success of the British enamelled-ware trade in South Africa, and elsewhere.

I may state that while I deemed it advisable, when making up the collection of foreign hardware samples, two years ago, to make a special feature of the

enamelled ware section of these samples, in order to emphasise the strong footing which Continental firms had acquired in this market, it is obvious to me that British trade is now steadily gaining ground, and that the British firm to whom reference has been made has nothing to learn from the Continent, either in regard to the manufacturing of their goods or the merchanting of these goods in oversea markets.

To-day the above firm is securing big contracts in South Africa, in spite of the keenest German competition.

In this connection it may be of interest to know that only last week one of the principal wholesale merchant houses in this country informed me that a contract had just been concluded by them with the firm in question for enamelled ware.

The merchants referred to, who are very keen buyers indeed, considered that the quality and prices of these British goods were better than any offered by Continental firms in connection with the placing of their contract. Equally satisfactory and encouraging reports have been received by me from merchants in other parts of South Africa, and I find from enquiries made amongst merchants that there is no foundation for the statement that British enamelling is more brittle than the German. The quality generally of the British article is regarded as superior, owing largely to the system of export adopted on the Continent.

It is customary for Continental makers to dispose of the entire supply of their "rejects" (*i.e.*, other than first quality goods) to factors. These factors in their turn (and there are 16 or more of such firms connected with this market) sort out the "rejects" into firsts, seconds, and thirds, and it is this system which has done so much to lower the standard of quality and price of enamelled ware in the South African market.

In spite of this system, and notwithstanding the fact that the British makers refrain from exporting these low grades, they are steadily expanding their trade and building up a reputation for a good standard quality of British enamelled ware at a competitive price.

As regards the question of late deliveries, it is a fact that some few years ago the Company had unfortunate experiences in this matter, owing to the acceptance of large orders in anticipation of extensive additions to their works which were to have been completed within a given time. Delay in this connection, however, resulted in the non-execution of deliveries to specified dates, but the trouble has now been entirely overcome and the Company are in a position to execute all ordinary specifications within a month of the receipt of orders.

Lastly, I wish to remove all doubts that may exist as to the question raised with reference to British goods being finished in Germany.

Every article supplied by the firm of United Kingdom manufacturers to which reference has been made is of British manufacture *throughout*, and the firm guarantees this to be the case. Their works include sheet rolling, stamping, tinning, galvanizing and enamelling works, and, with the extensive plant recently laid down, is said to be the most up-to-date factory of its kind in the world.

2844. Then as to misrepresentation?—The statements I should like to refer to are

(1) That by Mr. Stanley Machin, Vice-President of the London Chamber of Commerce, who said (*p.* 2 of [Cd. 6517]):—

"That the Government be urged to make provision, through the Board of Trade, for watching for cases of fraudulent misrepresentation, and, where necessary, taking action under existing law, which, in the opinion of the Committee, is adequate in most cases if effectively set in motion";

and (2) that by Mr. H. L. Symonds (*p.* 61 *of* [Cd. 6517]), who was asked by Mr. Campbell:—

"Do you think . . . the extension of the business of Trade Commissioners would assist manufacturers in the detection of these trade misrepresentations abroad?"—

and replied:—

"I do not think it would come directly within the scope of the Trade Commissioners to go round, either as *agents provocateur*, or as detectives . . . but the more we can get information on all subjects I think, the better, and the more closely we can be brought together."

In view of the above and other questions relating to the employment of the services of Trade Commissioners in connection with the detection of cases of misrepresentation of goods or the piracy of trade marks, I think it important to explain to the Commission that every effort is already made in this market to safeguard British interests in this matter.

Cases affecting various sections of trade have come to my notice, and the facts have been immediately placed before the Customs authorities, either in the Union of South Africa, or in Rhodesia, as circumstances necessitated.

In each case the action taken by the authorities has adequately met the position. The Customs authorities themselves exercise every vigilance in detecting attempts to misrepresent goods or infringe trade marks, and I am of opinion that this vigilance is partly responsible for the comparative absence of attempts to deceive.

During my experience in this market I have had to take active steps in regard to four cases of misrepresentation. Two cases were successfully disposed of by the authorities threatening the confiscation of the goods, while, unfortunately, the other two attempts could not be brought within the four corners of the law.

2845. Do you take any action in cases of piracy?—Yes. I at once report such cases to the Customs authorities.

2846. They very often play English plays here: do you report home when such a play is given here so that the royalties may be claimed?—I am afraid I have not gone into that. In regard to "Merchandise" I have brought cases to the notice of the Union Customs authorities, and they have taken the necessary action. I work through the Government here and then report to the Board of Trade.

2847. You have not been asked by the Board of Trade to take any notice of what English plays are played?—No.

2848. You also have some information to give us as to the administration of the Food and Drugs Act?—I should like to refer to a statement by Mr. E. J. Boake (*p.* 64 of evidence in London [Cd. 6517]), who said:—

"Our agents . . . have been much harassed by the interpretations of the inspectors under the Food and Drugs Act, in the carrying out of certain regulations . . ."

In connection with the above statement I should like to say that experience in this market has shewn that Trade Commissioners can often render material assistance to British exporters in matters connected with the administration of local regulations affecting the standards of purity of foodstuffs, &c., provided, of course, that manufacturers will report the facts to the Commissioners, and provided, also, that these facts present a reasonably good case for submission to the authorities.

In four distinct cases brought to my notice difficulties have been overcome by the representations made to the local authorities concerned. In two of these cases the shipment of consignments was held up, owing to the operation of the regulations. Representations were made, concessions obtained, and the results reported by cable. Such action obviated considerable delay and consequent loss to the exporters interested.

The above statement is only made in view of the above evidence and in order that the Commission may appreciate some of the directions in which Trade Commissioners can usefully serve the interests of British exporters in a Dominion market.

2849. What have you to say as to commercial travellers' licences?—I should like to refer to a statement by Mr. H. L. Symonds (*p.* 63 of London evidence [Cd. 6517]). He said:—

"I was told the other day that, when these licences are issued in Rhodesia to British subjects, these subjects are described (technically only, I suppose) as "foreigners," and I think that it is a constant source of irritation to British commercial travellers who go out to Rhodesia. If that could possibly be modified, it would be an advantage."

It may be of interest to the Commission to know that the term "agent of foreign firm" is used both in the Union of South Africa and in Rhodesia, as applying to the representatives of "oversea" firms of British or of foreign domicile, who take out licences for the purposes of trading.

Having been aware of the objection entertained by British firms and their agents in this market to the term "foreign," I made representations to the Union authorities some months ago, and I am authorised to state that a more acceptable and more apposite term will be substituted in the legislation to be introduced to Parliament dealing with the revision of licence fees payable in the Union of South Africa.

An opportunity will be taken of making similar representations to the Rhodesian authorities, and I have no doubt that the matter will be rectified in that territory as well.

Mr. Chairman, I should like to be allowed to refer at this stage to a remark that Mr. Pickstone made the other day*, in complaining that they had no information regarding the fluctuations in English prices of fruit. He said that he had seen "The Board of Trade Journal," which was of no value to them on that matter. I think it is necessary to point out that the Journal in question does not aim at supplying information to oversea people interested in industries in these oversea markets. The idea is to collect information in the oversea market and circularise it, for the benefit of British manufacturers, in the United Kingdom. It does not aim at the object suggested by your witness.

2850. Would you like it to aim at it?—No, I think it is the function of the Union Trades Commissioner in London, and, in any case, such information would be useless unless it were cabled.

2851. Are there any other points?—May I draw attention, in justice to the Union, to a return which appears in the Second Interim Report† of the Commission which goes to show the value of the Australian and New Zealand markets for trade purposes—that is, the value of the trade per head of population. I think it is only fair to the Union that I should draw attention to two points in this connection. In the first place, in the Australian statistics they add 10 per cent. to the home value as an "overhead" charge to cover freight, insurance, and so on. In South Africa we make no addition to the home cost, and there is no allowance made for freight. That makes, as I have said, a difference of 10 per cent. And then in Australia you are dealing with a European population; but here the native population is overwhelming, and for economic purposes it is necessary to arrive at the equivalent value of these natives to the European population. Opinions differ as to the number of natives that should be taken. Some take six, and others take 10, natives as the equivalent of one European. But if one takes only four natives as the equivalent in purchasing-power of one European, the Union trade per head shows up better than any other country contained in the table to which I have drawn attention.

2852. **(Mr. Lorimer.)** I find this report of yours so complete that, if I ask a few questions, it is in order to satisfy myself that I have understood your points. On page 5, with reference to the table on that page, I want to ask if those figures showing large increases between 1904 and 1911 bear any definite relation to the increased amount of land brought into use for the production of wool, mohair, hides and skins?—Yes, I think that is the case. There has been a great development in the agricultural industry during the period covered by the Census.

2853. Is the original land becoming more productive, or have you a similar proportion of products in both quantities of land? Have you the same proportion of products in 1911 to the land in cultivation or use that you had in 1904?—I think it applies in both ways: there is no doubt at all that the South African farmer is farming on more up-to-date lines and putting more fertilisers into the land and so increasing its productivity. In addition to that, I am quite sure that there has been an increase in the acreage under cultivation.

2854. You have got it both ways?—Yes.

2855. And the same thing applies to tea and sugar on page 6?—I do not know whether those industries are affected so much by fertilization and so on. I think there it is a question of increased acreage under cultivation.

2856. Then, if you will turn to page 7, and look at the table there on "Advances by Banks" I want to know whether they are cumulative, or do those figures represent, on the 31st December of each year, the difference between the amount advanced and the amount repaid?—They are cumulative. In 1908 it was 21,000,000*l.*

2857. An additional 21,000,000*l.* in 1909, and an additional 25,000,000*l.* in 1910?—No; it is merely a comparison of figures.

2858. That is the actual amount at the end of each year?—Yes.

2859. And that is being repaid all the time?—Yes.

2860. So that represents the difference between the amount advanced and the amount repaid at the end of each year?—Yes.

2861. If you look at the penultimate paragraph of that page, will you kindly explain what is the difference between the Government, the Agricultural, and the Land Banks?—They are one and the same thing. Parliament provides a certain sum for the purpose of assisting farmers, either for farm improvements or the purchase of stock or land. In the past, farmers have been very much in the hands of moneylenders, who bleed them by exorbitant rates, and this is a worthy object on the part of the Government to release them, and to assist farmers who are anxious to develop the amount of land under cultivation and to provide for farm improvements in other ways.

2862. But, I thought that, as you had the three names, perhaps they were different organisations for different purposes and differently controlled and managed?—No, they are referred to in that form simply to show that the bank advances money for agricultural development as well as for the purchase of land.

2863. Are these banks provided with capital by advances from the Government?—These are advances made from Government funds. I do not know whether their capital is only voted, or is simply a loan raised which is renewed when required.

2864. On page 8—with respect to your note at the foot of these tables—the value of merchandise is regarded as being the current value. Does that include freight?—No, it is the home cost, and includes cost of packages and packing, but not agents' commission when under five per cent. I think it might be assumed that these figures represent purely home value.

2865. Your table near the bottom of page 9 shows a very satisfactory increase in non-mineral exports from year to year, but there was a falling off in 1911; was that in any way connected with the drought? I thought the drought was in 1912?—The drought was in 1912, and we had another in 1913. I cannot, at the moment, and without examining the detailed figures, give an explanation of that falling off. I think it was in maize. I will give you figures in a moment or two.*

2866. In the same connection, you show that 1912 showed a very unusual increase. Perhaps it may have been accidental in respect of the dates. Part of the statement for 1911 may have got into 1912. Well, if you turn to page 10, I was struck with the increase of imports of electrical material in 1910 and 1911, until I found your explanation. That is on account of the changes at the mines?—Yes. The conversion of steam to electric drive.

2867. Now, in respect to the table on page 11, there is a steady increase of the imports of food and other things. I suppose there is a steady increase of the population year by year; do you know?—No, I think the country has more to spend.

2868. Not only a larger population but they spend more freely?—Yes; far more.

2869. Now, at the bottom of page 13, where you refer to the drop in the imports of machinery and mining material, you say there will be a pause before further progress is made, and that there will probably be some delay in extensions on account of the higher rates in the money markets throughout the world.

* See pages 309 and 310 of [Cd. 7706]. †[Cd. 7210].

* See the answer to Q. 2870.

That difficulty has now been removed. But is that any indication of further expenditure on the mines?—That is a very difficult question to answer. Capital is such a nervous quantity that political and other considerations have to be taken into account.

2870. Turn to page 14: There is an interesting point in the paragraph quoted from the Chamber of Mines' Report. I think we had the impression that the grade of ore was becoming lower; but it says that the recovery per ton milled has increased from 27*s.* 11*d.* in 1911 to 29*s.* in 1912, due to improvement in the grade?—I prefer that question to be answered by someone in the mining industry; I have simply given the facts. May I refer to those non-mineral export figures again, which we mentioned just now. It was as I supposed—between the two years 1910 and 1911—there was a drop of 144,000*l.*, which was made up in this way:—Maize alone dropped 271,000*l.* The drought, therefore, was responsible for the decline. Sugar also shows a drop of 33,000*l.*

2871. In regard to page 15: In describing there the very large amounts of new machinery which have been provided in the different power stations, you speak of compressors. Is drilling done by compressed air on the mines?—Entirely, I understand.

2872. The rest of page 15 of your Report is devoted to an explanation as to why so much of these large supplies have been obtained from foreign sources; I think the explanation is timely and valuable, and I hope it will be carefully considered by British manufacturers. A good many of the facts that you mention are deserving of the most careful consideration on the part of home producers?—May I just say that in regard to electrical machinery, I have recently had the most encouraging reports from the mining engineers. Men of high standing on the Rand, speaking as to the position now held by British firms, have informed me that great improvements have taken place, that we are now well holding our own.

2873. These plants were of a power and magnitude such as they had had no experience of at home, and they are now facing the fact and dealing with it?—Yes, in a very satisfactory way.

2874. Turning to page 20: You give us first of all a list of trades in which our position is supreme, and then follows another list in which we are holding our own in keen competition. Do you know if there is any slackness on the part of British manufacturers or anyone to show adaptability to the requirements of the market?—Of course, that answer can only be dealt with in a general sense. Some firms excel and far surpass anything that their foreign competitors can put up, and others, again, are not as progressive as some foreign firms; but, answering the question in a general way, I am of opinion that British firms are thoroughly alive to the importance of the Union market, and are putting forward every effort to capture the trade. I could give some very interesting cases (but one rather hesitates to refer to them) where the Board of Trade has initiated action and, as a result of the vigorous way in which British firms concerned have taken matters up, we have recovered trade which was formerly in the hands of our foreign rivals. I prefer not to mention particular lines, but we have definite cases.

2875. It is gratifying to hear that, because we have had people saying that British manufacturers have said: "This is what we have made all along, and if you don't like it you can go elsewhere"?—I think that is a relic of the past, and it has become second nature with some people to refer to things in that indefinite way. But such people are becoming fewer every day.

2876. Now, on page 21, in regard to fencing material, I know that the coarser kinds of wire are made in Germany and the United States, and the finer kinds of wire are made more largely in Great Britain; but I wanted to put a question about the fencing standards which you say Belgium supplies: Do you know if these are made of cast iron?—I think they are made of scrap iron, and, with cheap labour, Belgium is able to produce fencing standards of relatively low quality at a price which makes it not worth while for British manufacturers to give attention to the production of a competitive line. We have had our attention called to this particular trade which the foreigner has been able to monopolise, but if you go into it you will find that there is not sufficient profit in it. We do make standards, but of a better quality. A certain British firm has, however, within the last two years produced a patent fencing "dropper" which, I think, is going to take the place, and is largely taking the place to-day, of the Belgian dropper.

2877. The fencing standards are to carry the wire?—Yes.

2878. They could be made more cheaply here than imported? Well, an iron industry has been started in South Africa, and, naturally, that industry will give its attention in the first place to all the commoner lines such as this. We have lots of scrap metal in this country.

2879. On page 22 you have the percentages of the total trade. While the United Kingdom holds its own, you point out that there has been a decrease of Australian imports, and you account for that by the falling off in the imports of meat and other farm produce; but while Australia is 1 per cent. less in 1912 than in 1911, New Zealand shipments have doubled in the same year, and yet they are the same articles, I should imagine?—New Zealand trade went up by reason of the increased importations of butter, which were large, as the result of the drought in South Africa. These percentage fluctuations, while being open to different interpretations, are of no great significance. I think that it is misleading simply to compare one year with another.

2880. Are the German and other Consular services largely devoted to the extension and pushing of trade? I suppose the number of people employed is larger than your staff?—Yes, and the amount of money spent is very much larger.

2881. Do you think they get an adequate return as compared to your own?—I could not say, I know that they are very active and we are trying to be equally so.

2882. If you turn to page 31, the effect of the inclusion of Government Stores in the return of imports is to increase the United Kingdom proportion from 58·03 per cent. to 58·19 per cent., and British Possessions from 9·73 per cent. to 9·92 per cent. in 1912. All the foreign figures are less, with the exception of Belgium and Sweden; do you know why?—Sweden on account of timber, I should say. Belgium may be increasing in fencing standards or rails, and, possibly, iron sleepers.

2883. Turning to page 33: With respect to the exports of minerals: there is a falling off of 53,000*l.* in copper ore, and 89,000*l.* in smelted copper: is the production falling in copper?—No, it is increasing.

2884. This is an accidental reduction, then?—I think it is due to something in connection with railway construction to these new mines in the Northern Transvaal.

2884A. Now on page 40: you say: By the new arrangements entered into, "the advantages associated with the rebate system are perpetuated without the objectionable conditions being imposed." I was informed that pressure was being used to force shippers to sign a certain agreement?—There is an agreement in existence which shipping companies are requiring shippers to sign, but as this is so controversial a matter and *sub judice*, I think that by giving evidence on it I might prejudice my position as Trade Commissioner.

2885. I was assured by this man that he and many others, resenting this treatment, sent orders for goods to Germany?—That may be a temporary effect in respect of the lines which Germany can satisfy.

2885A. You tell us on page 42 that the principal remission of taxation effected since Union has been through the reduction of railway rates, which was estimated to amount to 1,336,500*l.* per annum. That is about eight per cent. of the Government's revenue. Has anything been said as to how that is made up?—As to how the reductions are distributed?

2886. No, but how the revenue is to be recouped for this reduction?—I think that is a matter of high politics, which will come up for consideration at the next session of the Union Parliament.

2887. On pages 46-47 there is an error in your figures. The railway surplus in 1910-11 is 278,433*l.*

and the deficit of the harbours was 203,041*l.*, leaving a surplus of 75,392*l.* for 1910-11, which is what you give us. In 1911-12 you have 618,904*l.* railway surplus with a harbour's deficit of 237,846*l.*, a difference of 381,058*l.* instead of 456,449*l.* as you put it?—Yes, I see. That is probably a printer's error.

2888. **(Mr. Bowring.)** You tell us that you have on your list the names of 1,400 manufacturing firms. How many are Colonial?—They are all British.

2889. Can you separate them from those manufacturing in the Dominions and at Home?—They do not take into account any Dominion manufacturing firms. In addition to the 1,400 British, I have had communication with a number of local firms, but the figures quoted do not cover the local firms, except when the local firms are requiring new machinery and so on, and we endeavour to put before them the interests of British manufacturers of such machinery.

2890. You do not interest yourself in the manufacturing concern, say, in Canada or Australia?—No, Canada has its own Trade Commissioner. Australia has a Commercial Agent here, who is not a whole-time officer, but divides his time between that and other things.

2891. You devote your attention entirely to the Home manufacturers?—Yes, entirely.

2892. With regard to your Trade Correspondents, you say you have about half a dozen in various parts of the Union?—Five.

2893. Do you find those sufficient for your purposes?—As a matter of fact, it happens to be a question that is under consideration by the Board of Trade at present; the question of the number of Trade Correspondents or the establishment of a branch office under the Trade Commissioner. I would, therefore, rather not go into the question of whether the number of Correspondents is sufficient.

2894. Now, in regard to land banks: how do these institutions work in regard to those who require advances? Is the land valued?—Yes, by an assessor, or valuator; but in regard to that, more information could be afforded by an officer of the Union Treasury. I only obtained the results for the purposes of my report. The operation of the bank itself I could not speak upon.

2895. These advances are fairly easily obtained?—Yes, on good security, but at present the bank does not possess sufficient funds. Whether further funds will be provided by Parliament I do not know.

2896. Are those sums voted by Parliament annually?—No, not annually. Before Union there was a Transvaal bank, a Free State bank, and a Natal bank. There was none in the Cape Province, and after Union the banks were amalgamated and run under one fund, I understand.

2897. **(Mr. Tatlow.)** In regard to page 42, in reference to the remission of railway rates since the Union, you say the sum is estimated to amount to 1,336,500*l.* per annum. Has not that remission been provided by the surplus revenue of the railways?—Of course, the result of reduction in railway rates would be to diminish the surplus.

2898. Is it not rather this, the revenue of the railways has been sufficient to pay the full interest on the capital in all these years and thus to remit taxation to that amount?—Yes, after providing interest, depreciation, and betterment the railways have a surplus.

2899. So that no burden upon the country is represented by those figures?—No, except that if there is a shortage in the general account of the country you have to provide funds from other sources and tax in some other form.

2900. But the taxation rates could not have been so reduced unless there had been that revenue from the railways?—No.

2901. And the estimate of 1,336,500*l.*—is that an estimate of what the annual amount of remission has been since Union? Is it the average per annum? That was a comparison with the year following the remission of the rate?—An estimate of the additional revenue that would have accrued had the reductions not been made. Of course, the general Exchequer is affected by this loss of revenue.

2902. In regard to the imports of general merchandise, you say the proportion of the United Kingdom for 1912 was 58·03 per cent., and then you said we were holding our own in regard to competitive imports. Is our proportion very much higher if confined to competitive imports?—Yes, if one eliminated raw material, such as timber, wheat, flour, and oil, &c., we would have a still larger percental share of South Africa's trade.

2903. The thing could be arrived at by eliminating the large things that England could not supply?—I have done that, but in making comparisons of this kind one is, of course, subject to criticism.

2904. **(Sir Alfred Bateman.)** Don't you think you could give us an estimate?—Yes, I will do so.*

2905. People can form their own ideas, of course, as to what should be eliminated?—Yes, I can only put forward an approximate result based on what I consider to be non-competitive imports.

2906. **(Mr. Tatlow.)** In regard to commercial travellers' licences, has that question now been fixed?—So far as the principle is concerned. In the past these licences were payable in the Cape Colony, the Transvaal, Natal, and the Free State. In the Cape the licence was 50*l.* with an additional 5*l.* for every additional firm represented. This was considered exorbitant and it has now been decided by the Union Government that there shall be one consolidated fee, and that fee, I understand, is to be very much below the total of the four licences prevailing before. A Bill has been drafted, and is ready to be put before the Union Parliament when the time is convenient.

2907. You said that you visit England biennially?—Yes.

2908. Is that sufficient?—Well, for personal reasons one would like to pay annual visits, of course, but for the purposes of the work I think a visit every two years is sufficient. If one spent too much time on the other side, one would run the risk, perhaps, of getting out of touch with the market.

---

* *Note.*—The witness subsequently supplied the following letter:—

March 5th, 1914.

SIR,

WITH regard to the request of the Commission, as referred to in your letter of the 3rd March, to be furnished with a statement showing the relative value of the trade of the United Kingdom and other countries, after eliminating the value of non-competitive imports, I beg to point out, as I did in my evidence, that it is a difficult matter to determine the nature of the imports which can be classed as non-competitive without exposing oneself to criticism.

This being the case, I have only included such imports as seem to me to be articles which the United Kingdom cannot produce. The articles which I propose to classify under this category are the following:—Calcium Carbide, Ghee, Coffee, Dholl, Wheat, Flour, Currants, Raisins, and Dates, Ground-nuts, Beef and Mutton (fresh), Rice and Paddy, Brandy and Rum, Wines, Nitrates, Motor Spirits (Petrol), Paraffin Oil, Palm Kernels and Palm Oils, Tea, Sugar, Quicksilver, Unmanufactured Tobacco, Unmanufactured and Planed and Grooved Timber, Coir Fibre, Resin and Rosin, Turpentine, and Unmanufactured Zinc.

After deducting the value of imports in respect of each of the above items, and basing my calculations on the balance, I find then that the percental proportion of the United Kingdom trade to the total value of imports of "competitive" merchandise to South Africa is increased from 58·03 per cent. to 66·95 per cent.; a nett increase of 8·92 per cent. The same method of calculation applied to other British possessions and foreign countries produces the following results:—

British possessions show a decrease from 9·73 per cent. to 4·96 per cent., or nett decline of 4·77 per cent.; while foreign countries show a decrease from 32·24 per cent. to 28·09 per cent., or a decline of 4·15 per cent.

It is thus seen that the position of the United Kingdom is greatly improved by the elimination from the import figures of goods of a non-competitive character.

It may be of interest to the Commission to know that the value of the articles enumerated above and classed by me as non-competitive constitutes 13·71 per cent. of the total value of all merchandise imported from oversea into the Union.

I may add that there are a number of other articles of import which cannot, in my opinion, be produced in the United Kingdom, yet which I have not deemed it advisable to include in the above list, since the United Kingdom does participate in some way in the export of such goods to this market. As illustrating the class of goods to which I refer, I may mention such items as Jute and Hemp Bags, the principal export, of course, being from India, and amounting to £388,000; but in this case the United Kingdom was credited with the export of £34,000 to South Africa. The same objection applies to Paraffin Wax, and a number of similar items.

I am, &c.,
R. SOTHERN HOLLAND,
H.M. Trade Commissioner.

The Secretary,
Dominions Royal Commission,
Cape Town.

2909. With regard to South African imports having nothing added for freight and insurance, and Australia adding ten per cent., and therefore showing an unfair comparison; is not that an argument in favour of uniform statistics being adopted?—Yes, I think so.

2909A. Would you strongly favour a conference of Imperial statisticians on the matter?—Yes, I think it is a most desirable object to attain—uniformity of compilation—and I strongly favour a round table conference.

2910. **(Sir Jan Langerman.)** You say in your report that the drop in machinery and mining material for 1912 does not mean retrogression in the mining industry. I think you are quite right, because I find the imports of machinery during 1913 exceeded the imports of 1912 by £150,000, of which £100,000 alone is due to mining machinery?—Yes.

2911. But what proportion of those imports represents trade with the United Kingdom?—Do you mean for 1913?

2912. You can give it for 1912.—483,000*l.* out of 689,000*l.* That is about 70 per cent.

2913. Do you consider that satisfactory?—I think it is capable of increase; taking all things into account, I think 70 per cent. is a very good position considering the keenness of foreign competition.

2914. You lay stress on the keen competition with Germans and Americans?—Yes.

2915. Why is it that the English manufacturer has not been able to supplant them?—There are many factors. For instance, the question of representation. You may have a man representing an American firm who is more alive than the man representing British firms with the same class of machinery.

2916. Do you not find it your experience that the American and German traveller is much more alive to the business than the British traveller?—No. I cannot admit that. I thought so at one time, but I think to-day it is the reverse. I have come into contact with these men, and with the leading experienced engineers on the Rand, and although the latter at one time criticised our representation, they now speak very favourably on the subject. I find that, on the whole, it is satisfactory.

2917. Your personal experience also is that way. You know, however, doubtless, that there is a general impression that the British manufacturer is generally conservative, and, in regard to the manufacture of machinery in particular, as late as five years ago we had some alterations to make on our mine, and the British manufacturer absolutely refused to do the work?—Well, one does get those reports, it is true; but similar complaints are at times made in regard to our competitors. It is the question of the individuality of the firm. But in regard to your own experience at Randfontein, where you put down what is, I suppose, the biggest plant of its kind in the world, over 80 per cent. of that plant was, I think, British.

2918. Yes, but what we complain of is the time limit. They are always about two months behind the American and German. It is very important to have our machinery as quickly as possible, and that is where the home producer is lacking?—As a matter of fact, I think that that particular complaint has been encouraged recently, owing to the unfortunate industrial troubles in England—the coal and railway strike which affected deliveries very considerably.

2919. Every day's delay means a loss of thousands of pounds sometimes, and although we acknowledge the superiority of British workmanship, we are bound to give orders to German and American manufacturers at times in order to get the thing done quickly. Now, about the Chamber of Commerce in Johannesburg wanting orders placed locally, do you think that is a reasonable request?—Not entirely.

2920. Considering that the Government of the country is spending the taxpayer's money, should not they go to the cheapest market and avoid the middleman?—Yes, I agree with that, and on that ground I think the general policy will be decided. In reply to representations made by commercial bodies here I notice that Mr. Hoy—who represents the Railways—invariably contends that his Administration must take into account the question of the taxpayers' money, and get the goods in the cheapest and best market. But I think the policy of placing orders through local firms is to be regretted on some grounds; chiefly in cases where foreign firms are represented and British firms are not; and my object in bringing home to manufacturers the danger of ignoring this policy has been in order that the home manufacturer may appoint local representatives in the market and so compete on equal terms. In the case of machinery, local firms do represent the interests of the home manufacturer to a considerable extent.

2921. Another difficulty is the irresponsibility of these local agents. We cannot hold the manufacturer at home liable for demurrage. He always says "We have no responsibility" and the agent is perhaps not a substantial man?—It is rather an interesting fact that the local people advance the fact of their presence here as an argument for accepting responsibility. They say: "We are here and you can have recourse against us."

2922. It is the experience that whenever we want to go for the local agent he has nothing, and when we go for the manufacturer for being late he says: "We have no responsibility"?—Yet I had correspondence with an important South African municipality a short time ago about placing orders locally owing to the short time given for tendering. I said that it did not give the British manufacturer an opportunity of tendering. But one reason, and the principal reason, given me by the municipality for placing the order locally was that the local agents who received the order would assume responsibility for the goods in running order. They would take responsibility for the delivery and the running order of the plant before handing over to the Municipality.

2923. I am sure that if the British manufacturer were to accept the responsibility for demurrage he would get many orders that are at present placed with America and Germany?—I think the British manufacturer is quite alive to the point you have made, but I certainly will make a note of it.

2924. You mentioned Australia putting on 10 per cent. to the invoices. Do you know at all whether any correspondence has taken place with Australia about it?—In regard to the Union doing likewise?

2925. No, the 10 per cent. extra. They place 10 per cent. on the invoice, I understand?—I do not know whether there has been correspondence. May I explain? My purpose was to show that the comparisons in a particular table were, in my opinion, somewhat unfair to the Union. I pointed out two details—the native population and the 10 per cent. addition to the home value.

2926. **(Mr. Garnett.)** I should like to express my great appreciation for this report, which I have read and re-read several times with the greatest interest. I think the remarks you give in regard to British trade and explanations with regard to any displacement should be well read and pondered over by everyone engaged in trade in the United Kingdom. On page 5, after calling attention to the great excess of males over females, and the slow growth of the European population, you say there have been more departures than arrivals. Is there any special reason for that?—Well, of course, recently, as you are aware, we have had industrial troubles in this country, and the recent one is but a repetition of others that took place before. And I think they have contributed directly to a certain loss in the white population.

2927. Due to the labour unrest?—I think that is partly the reason.

2928. On page 7, referring to the want of a forecast, does not the Government make any estimate of the cereal crops?—No, it did not. It now proposes to organise a departmental collection of agricultural statistics.

2929. You call attention on page 12 to decreases in the imports of flour. Is milling increasing as an industry?—Yes, and in a few years I think there will be a considerable further increase. Of course, transportation facilities will have a direct bearing on the production of grain.

2930. On page 17, clause 9—Textiles, the last two paragraphs I am afraid I do not understand. You mention overstocking in 1911 as an explanation, and consequently less importation. Had our competitors

been very active in foreing their goods?—Yes, I followed them very closely. I know the firms interested, an Italian firm and a German firm particularly. Competition was keen, and these people offered attractive prices and the merchants were tempted to lay in large stocks.

2931. Reading your figures carefully, I think the Mother Country in textiles—wool and cotton—seems to hold her own exceedingly well. On page 27, the German firms are rather willing to adapt their goods to individual merchants' requirements and give prompt delivery. Are the complaints that the English manufacturers quote long delivery very numerous, because long delivery means that they are well under order? Or is it that they quote a date for delivery and are behind?—I cannot admit that they are unpunctual as a rule. Certain cases may come prominently to one's notice, and they are made a lot of, and leave a bad impression. The result of long delivery is to cause great inconvenience, but, generally speaking, the British delivery is as good as that of our rivals. Let me illustrate it by a particular recent case. Take enamel-ware, which was supposed not to be made in England but which I have explained is entirely of British manufacture. Not only did we do the finishing but guaranteed delivery within four weeks of receipt of order. Of course, there is room for improvement in all things, and complaints will always be made by someone or other. It is inevitable.

2932. You are no doubt aware that in England we have had exceedingly busy seasons lately and been packed up with orders. That has been a very good reason? — Yes, that was brought home to me very forcibly on the occasion of my last home tour.

2933. Now, if I may call attention to what, in my mind, is the outstanding feature of the whole report, it is that the United Kingdom, as distinct from the rest of the British Empire, has increased her exports since 1907 by 6½ millions against the foreign countries' or rest of the world's 4½ millions, and although its percentage of increase is smaller than that of our rivals, still the total of our trade is so enormous that it seems to me that the prospects of British trade and the hold that our trade has on the markets seem to be founded on a very secure basis?—Yes, I think so. It is my opinion, my deliberate opinion, that we hold a very good position. One has to take into account the natural advantages and resources of other countries in making comparisons of any manufactured articles, but we hold our ground very well. I think, however, that a Trade Commissioner can frequently act as a finger post to the manufacturer as to openings for trade, and can assist him very materially in finding a proper representative and in keeping him posted with conditions of trade and the nature and extent of foreign competition. Taking things generally, I think we hold a good position, and I think that the figures contained in my report justify that statement.

2934. **(Mr. Sinclair.)** You told us, as I understood, at the beginning of your evidence, that, in your opinion, the coloured worker was increasing faster than the white worker?—No, I do not think so.

2935. What is your opinion on that important subject?—In efficiency or in numbers?

2936. In numbers.—Of course, in regard to the population, my report said that the native population was increasing in a greater percentage than the European, but in regard to the coloured man, in regard to efficiency——

2937. No, as to numbers.—I won't venture a comparison, but undoubtedly in the Western Province of the Cape Colony the coloured man, as distinct from the black man, is more and more becoming a competitor with the European.

2938. And may we take it that work and the discipline involved in work are tending to improve his character as a worker?—Yes, I certainly think so.

2939. So that he is becoming stronger and stronger as a competitor with the white man?—Yes. I speak of the Western Province.

2940. Do you wish to express another view as to the other portions?—No.

2941. Is the statement that one sees in the papers, that a larger number of white workers is leaving the Dominion than is coming in, correct?—At present, yes.

2942. Do you know any special cause?—Yes, I think it is due to the industrial upheavals.

2943. Do you think that will correct itself when you get down to normal?—Yes.

2944. In answering Sir Alfred Bateman's question, you told him that in competitive trade the Mother Country was holding its own, and you added, "except in certain branches." Had you in mind any special directions in which you could assist us with suggestions?—I know branches of trade where I think we could improve our position very well, but I do not know whether you wish to press your point. We are taking action in certain branches of trade now, which I think might be improved, and we have introduced the matter to British manufacturers who are best situated for competing, and they are taking action. I would rather not mention what those lines are.

2945. We are considering how the trade of the Empire is to be extended and developed, and you prefer to put it in that general way, that in the directions where you have discovered a weakness you have taken such steps as suggested themselves to remove the weakness?—Yes. There are naturally many more lines where steps could be taken in future, but we are doing the most urgent first.

2946. You said that you were doing your best to make your office useful locally, and that in so doing it served the other purpose—that is, I take it, its main purpose—of advancing the interests of the British merchants?—Yes.

2947. That is generally the main scope of your office and department?—Yes. To further the interests of British manufacturers.

2948. Now, when you tell us that in trying to make your office useful, and of local assistance, and in giving information to some 1,400 firms, were those firms connected with, or do they represent, British firms?—Perhaps I did not make myself clear. I said that I was endeavouring to make the office useful locally, which would serve the double purpose. But the 1,400 firms were not local firms—they were British manufacturers.

2949. They were firms that are connected with or representatives of British firms?—No, it is the manufacturing firm itself in the United Kingdom. In a great proportion of cases they have local representatives of some kind or another.

2950. As regards the Imperial Trade Correspondents of which you have told us there are a number, you have one at Johannesburg, and there are others at other centres—do they correspond through you or direct?—They correspond direct in order to avoid delay. Copies of their letters are sent to me in order that I may keep in touch with what is passing between them and the Board of Trade on the other side.

2951. And do their letters go through the Board of Trade?—Yes.

2952. And are their communications and investigations made in the interests also of British firms?—Entirely.

2953. And yet I observe they are called "Imperial" Trade Correspondents?—Yes.

2954. Do you regard any Correspondent whose function is to care for the trade of the Mother Country only an "Imperial" Trade Correspondent?—No, they are British.

2955. They ought to be called "British" Trade Correspondents?—Yes, I should say so.

2956. You had something to say about the views of the Royal Colonial Institute. You thought they showed some possible conflict between that body's proposals and the working of your own department, but what the Royal Colonial Institute wanted, was it not, was a wider field of information?—No, because the field they are attempting to cover now, as suggested by their correspondence, is already covered by the official organization of the Board of Trade.

2957. They were not seeking to cover wider grounds?—No, except in so far as they wished to gather information regarding attractions of pleasure resorts. Such matters we do not take account of.

2958. You had something to say as to the criticism that had been made by a witness before us the other

day, who suggested that "The Board of Trade Journal" did not give as wide information as he thought perhaps it should have given, and I understand you to express the view that it is not the aim of that journal to supply information to merchants oversea?—No, it is purely for the information of British manufacturers.

2959. Do not you think that better work could be done, and that the interests of Imperial trade in the different centres could be better served, if the aim of such a journal was to give information as well to merchants overseas?—No, I think it would become too general, and I am a great believer in each country carrying out its own trade organization.

2960. That is the opposite of an Imperial outlook for the trade of the various parts of the Empire?—Yes, but I think a lot can be done by co-operation.

2961. Would not that be co-operation in its best sense?—No, I think it is centralization.

2962. Does not centralization, where there is representation of all, mean co-operation?—It is co-operation carried to its exteme limit. It is then carried too far. I think a good deal of give and take may be done with advantage. For instance, here there is a Canadian Trade Commissioner, and we are next door to one another, and we frequently see and discuss things with one another in a friendly way, but I do not believe in over-centralization. To my mind such a proposal is not practical, it won't work out in detail.

2963. Would it be unfair to say that you are not an Imperialist as far as the trade of the Empire is concerned?—I am nothing if not an Imperialist, if that means one's desire to see all portions of the Empire flourish and work in harmony, but I think that that end can be best secured by each part of the Empire carrying out its own organization in matters of trade. That is my own view.

2964. May I refer you to the view on that question that was given by Mr. Harris, the gentleman who represented the Imperial Institute before us in the Mother Country—that the trend of that Institute has been, year by year, to expand and to extend the trade of the Empire and the sphere of usefulness which that body was trying to exercise?*—Yes, and I think it serves a very useful purpose. It is of great advantage to people in the Dominions. That is one of the directions in which I have tried to make my office useful for local people—samples of ore have been brought to my office, for instance, and, entirely free of charge, the Institute has made analyses and given the commercial values of these ores.

2965. And, whilst that body began by confining the information it collected to British merchants, it has gradually developed a system of extending the information to Colonial merchants of repute to whom the information may safely be given?—My own opinion is that there is a great distinction between the Trade Commissioner's Office and the Imperial Institute. The Dominions Trade Commissioners are representative of their own Colonies, and those countries are fast increasing their development. Therefore, they must come into conflict sooner or later in the matter of trade. A manufacturer in Canada will come into competition with a manufacturer in Great Britain, and a manufacturer in South Africa with another in New Zealand, for instance. I think if you centralise you will eliminate all the most important factors—first, the national identity of a Dominion, and also the human side of things. You cannot get a Trade Commissioner to have enthusiasm in his work if he is to represent the whole Empire. Suppose a Canadian was appointed Imperial Trade Commissioner in this country, I do not think he could eliminate his affection for Canada and his desire to promote her interests at the expense of other portions of the Empire. He would become a mere machine if he did.

2966. The point that I am trying to confine attention to is that there is a different policy between the attitude of the Imperial Institute and the British Trade Commissioners, as to the scope of the supply of the information that comes before them in the interests of trade?—Quite so, but then the aims are not the same. I draw a great distinction between the functions and objects of the Imperial Institute and the Trade Commissioners. The Imperial Institute simply enlightens people in regard to the value of a certain discovery, but that discovery may come into conflict with a similar discovery in another Dominion. Those two Dominions will then fight for the trade.

2967. **(Sir Rider Haggard.)** *A propos* of the heading in this précis that misrepresentation or infringement of trade marks occurs; do you find that there is much misrepresentation?—Not much. I think the reason for this absence is the vigilance of the Authorities in this country. Cases have come to my notice and the Government has taken action as far as possible.

2968. Have you anything further to say on that heading?—No.

2969. Have you ever given your attention to the matter of an Empire trade mark?—No, apart from reading discussions that have taken place at Commercial Congresses; but from the practical side I do not think I could give any views of assistance.

2970. **(Mr. Campbell.)** I think that you said, in reply to Mr. Sinclair, that you admit that there is a very large field for the large Dominions and the United Kingdom trade representatives to co-operate?—Yes.

2971. I take it that, although you object to any bureaucratic Imperial control of trade affairs, you would recognise and admit that in order to direct this co-operation it would be necessary to have some sort of Imperial Advisory Board?—Yes, I think an Advisory Board is very desirable. I think a round-table discussion would be a good thing. May I just illustrate my position in regard to centralization? Supposing there were an opening for trade in South Africa, my usual course is to despatch particulars to the Board of Trade. In the case of a contract, for instance, I send the specifications and drawings to the Board of Trade, by whom it is disseminated among all British manufacturers likely to be interested. Suppose you had a central office in London, and I sent that information there, are they going to hold back the distribution of that information until it can be sent to Canada and Australia and New Zealand for the information of manufacturers in those Dominions?

2972. **(Mr. Sinclair.)** Could you not send it to Australia?—It would take longer than to England and reach one place before the other—you have that to consider. I merely give it to illustrate my position.

2973. **(Mr. Campbell.)** Generally speaking, I have had all my difficulties cleared up except the one in respect to the activities of British merchants. In reply to different Members, you have, I think, emphasised the position that the British merchant is quite alive to the necessities for new openings for trade in South Africa, but in your report—and this is my particular trouble—you point out, on page 25, reasons for the success of the United States, and you give as a reason "their inventiveness and genius in the matter of supplying something new and attractive," and so on; and then you give reasons for the success of German competition, and you say "there is a determination and thoroughness about German commercial methods which is deserving of imitation"; and with respect to the Netherlands you point out that there has been an important official action which has resulted in the success of their trade, and, I suppose, the Belgian trade; and so on with the Italian trade. It does appear to me that these statements in the report are put there for the purpose of comparison of the activities of the British merchant with those of other countries?—Yes, but I give the reasons for the "relative" success of those countries in competition. Each country has its own characteristics, and those are my reasons for accounting for the relative success of those countries; and, if I may also point this out, a Trade Commissioner's Report is written with an object, and that is to arouse greater activity and give reasons for the exercise of greater activity.

2974. But would you go so far as to say that there is not any direction you could point out in which the

* See pages 171–189 of [Cd. 7351].

British merchant could increase his activity in this country?—I have already stated that there are many directions in which we could. We could increase even if we did 90 per cent., but I simply made a general statement that, taking things as they are, we stand in a very good position.

2975. But, taking the case of the United States, for instance, would you say that the British Board of Trade is as well represented as the United States with the same expenditure of money on organization and the same covering of ground by Board of Trade representatives and Consular representatives?—In regard to the expenditure of money, as far as the oversea organization is concerned, there is not the same expenditure, but I think our system is better. I think the system whereby the Trades Commissioner is constantly on the move serves the same purpose as having a number of people at different centres. In the case of Johannesburg, we cannot do quite as much. I know that merchants have at times found it necessary to appeal to some one for catalogues of certain machinery, and, in the absence of a British Office, it has probably been the case that, through the agency of the American Consul, an American firm has got the order. Occasionally, circumstances of that kind do arise, but I think, on the whole, that our system is better than that of our competitors. I think our rivals have to maintain the system that prevails, because, apart from the trade side of their work, they have certain Consular functions to perform which make permanent residence essential.

2976. I think it was in one of your reports that I saw attention called to the fact that the United States had a special representative in Johannesburg, and you recommended something similar?—Yes.

2977. That competition of Italy in cotton goods, is it in any way prejudicial to the Manchester cottons, or does it compete with rough Indian cotton?—I hesitated to give you a specific case just now where trade could be assisted by a Commissioner taking the initiative. But I will mention here, to make my evidence clear, that, in this country, there is a certain line of cotton-piece goods which is used by the Dutch farming population and by the natives. It is a very cheap cotton print. The features of it are the fastness of the dye and the particular method of printing and finishing the cloth, which was done in a hard "boardy" way. When the native buys this cloth, he feels it, and if it has not got that "boardy" finish, he passes it by. This trade was formerly entirely in the hands of Germany. It is a very large trade, and for years past British firms have had their attention called to it by individual merchants, but I think these merchants simply gave the total value of their own buying. This did not mean to the manufacturer a proposition for which it would be worth his while laying down a special plant at great expense. When I took over the office of Trade Commissioner in South Africa, I took up this matter with merchants at different centres. I was not encouraged, because they said that the thing was well known in Manchester, and they did not think any great advantage was going to result from my efforts. I asked the Board of Trade to allow me to go to Manchester specially to consult the trade as to whether it could be done. I was able to give a rough idea of the total volume of trade in that particular article, and, to be brief, I may say that a considerable sum was voted before I left Manchester for laying down special machines. For twelve months and more experiments were made and the cloth is now successfully established in this market. We are doing a very satisfactory share of the trade. It is interesting to remark that, at the same time as I took the matter up with Manchester an Italian representative visited this market for the first time, and he, too, saw the opportunity of competing. The position to-day is that, instead of this being a German monopoly, Manchester, Germany, and Italy are now competing for the business, and I think we will win in the end.

2978. **(Sir Alfred Bateman.)** Is there anything which you wish to add?—I should like, if I may, to refer to one further point in the evidence taken by the Commission in London. Mr. H. L. Symonds, representing the London Chamber of Commerce, referring to the periodic visits of the Trade Commissioners to the Mother Country (page 62 of [Cd. 6517]) said:—

"In the London Chamber of Commerce, we have always done our best to arrange for interviews between these Trade Commissioners (when they have come home from time to time) and our members, and our Secretary has taken a great deal of trouble in affording facilities for these interviews; but, unfortunately, people are very often very lax and do not seem to care very much about having them." It would, I think, be unfortunate if the Commission concluded from the above statement that the periodical visits of Trade Commissioners were generally regarded with indifference. As regards this market, experience proves the contrary to be the case.

During my last tour of the Home market (1912), I visited 13 manufacturing centres, and the number of recorded interviews with individual manufacturing firms was 187, whilst a number of additional interviews were granted of which no record was taken. Of the 187 referred to, no less than 55 firms were seen at the offices of the London Chamber of Commerce or at the Commercial Intelligence Branch of the Board of Trade in London. This, I think, is proof that Home firms take practical advantage of the facilities afforded them.

I should like to say that Chambers of Commerce render Trade Commissioners a very real service in connection with these periodical visits to manufacturing centres, for not only do they provide office accommodation but, in many cases, they put themselves to a considerable amount of trouble in circularising their members and in subsequently arranging times for interviews and giving particulars to the Commissioners regarding the nature of subjects to be discussed and the standing of firms, &c. This co-operation greatly facilitates the work of the Commissioners and econo mises time.

Cape Town, Tuesday, 3rd March, 1914.

Mr. Kenneth Bingham Quinan, General Manager of the Cape Explosive Works, Ltd., called and examined

2979. **(Chairman.)** You are the General Manager of the Cape Explosive Works?—Yes.

(*The witness submitted the following statement.*)

Cape Explosives Works, Limited.

Synopsis of evidence to be given before the Dominions Royal Commission in support of an application to the Government of the Australian Commonwealth for the abolition of the 5 per cent. *ad valorem* Customs duty which is at present levied on explosives of South African manufacture entering the Commonwealth.

1. Explosives manufactured in, or the produce of, the United Kingdom enter the Australian Commonwealth duty free, and we contend that we should be given a similar privilege for our manufactures. All other explosives pay a Customs duty of 5 per cent. *ad valorem*, so that South African manufactured explosives obtain no preference whatever, but are put on the same footing as Continental manufactures.

2. As showing the extent of the reciprocity already existing between the Commonwealth and the South African Union, and how greatly the former benefits therefrom, we may mention that during the year 1911—the last year for which we can obtain definite figures from Australia—the preference given by the South African Union to commodities of the Australian Commonwealth amounted to 45,918*l.* in the form of

rebates of duty, whereas the Australian Government only reciprocated to the extent of 796*l*. It is difficult, therefore, to understand the attitude of the Australian Government in regard to South African manufactured explosives.

3. To the best of our knowledge we are the only company selling high nitro-glycerine explosives in Australia which has no connection with any trust or combine, and we originally entered the Australian market at the invitation of several of the leading Broken Hill mines, making our first shipment of explosives in December, 1908.

The explosives trade at the time of our entry was in the hands of—that is to say, regulated and controlled by—a body known as the High Explosives Trade Association, composed of the representatives of the different trust companies or their partisans, who were about to increase very seriously their prices to consumers when we were appealed to by the mines above referred to, with the result that the proposed increase was at once abandoned and prices resumed their normal level.

In this connection it might be mentioned that in the "Cape Times," of 28th February, 1910, a cable was published, dated Melbourne, 26th February, which stated that the Directors of Broken Hill Mines had informed their shareholders that the Cape explosives meant an annual saving to the companies using them of 125,000*l*.

4. The majority of our customers in Australia are mining companies who have entered into contracts with us on the co-operative system, under which we supply at factory-cost plus certain charges for interest and amortization. If the obnoxious duty is removed, these companies will obtain the full benefit of the removal, as under their contracts with us we forward explosives to destination, and they have to refund to us all costs of transport, landing, duty, and any other charges payable on their explosives, so that the benefit to these Australian mines will be a real one.

We, on our part, have done all we possibly can to make these charges as light as possible, even going to the extent of purchasing our own steamer and shipping the explosives in her at regular intervals of from three to four months, charging a considerably less rate of freight than could be obtained from the shipping companies.

5. Attached is a schedule showing the number of cases of explosives shipped by us to the Australian Commonwealth from the time we entered the market in December, 1908, to the end of our last financial year, 30th June, 1913, together with the amount paid by us in duty as nearly as we can give it.

We are putting this evidence before the members of the Commission in the hope of enlisting their sympathies and obtaining their valuable assistance in our endeavour to secure what we consider our just rights as producers in a British Colony.

Statement shewing Explosives shipped by Cape Explosives Works, Limited, to Australia since the commencement of our business with that Continent in 1908 to 30th June, 1913, and the duty paid to the Australian Commonwealth on same.

Cape Explosives Works, Ltd.,
Somerset West,
Cape Province.

12*th February*, 1914.

2980. **(Chairman.)** And you do a large trade with Australia?—We would like to.

2981. I see by your statement that you do an increasing trade?—Yes.

2982. Last year the value was 31,000*l*.?—Yes.

2983. As compared with 21,000*l*. in the previous year, 25,000*l*. in 1911, and 15,000*l*. in 1909–1910?—Yes.

2984. In that trade with Australia, whom do you compete with?—Almost entirely with the Nobel Trust.

2985. Where do they manufacture?—In Europe, in Great Britain, and on the Continent.

2986. And your point is, that they send in goods which obtain a rebate of duty, whereas you have to pay the full rate?—That is my point or, more particularly, that the explosives manufactured by British factories under the Nobel Trust are allowed to be imported into Australia free of duty, but we are placed on the same footing as their German factories and pay 5 per cent. duty; a portion of Nobel's produce, therefore, enters free of duty and a portion pays 5 per cent.

2987. I should point out that fiscal questions are outside the reference of this Commission, but I understand you to appeal to be placed on the most favourable basis and not upon the least favourable?—Yes.

2988. The question is perfectly simple, and it remains for the Commission to decide whether they can forward your request to the Australian Government?—Yes.

2989. **(Mr. Campbell.)** You say that you compete chiefly with the Nobel Explosives Company?—Yes, or rather the companies comprised in the Nobel Trust.

2990. Do you know whether the capital of that Company is generally held on the Continent or in England?—I should say, as a guess, that it is about evenly divided between the Continent and England.

2991. Do you know, in regard to the stuff which they export from England, whether the whole process of manufacture is carried on there or only a part, and the rest on the Continent?—That is rather a difficult question for me to answer, for this reason: The finished product, from the Australian point of view, is identical, whether it is made in England or on the Continent, and the process of manufacture is complete in both cases. They use the same raw materials and put the goods through the same process of manufacture.

2992. Practically, all the high-power explosives are in the hands of the combination in Europe?—Yes.

2993. You have nothing whatever to do with it?—No. I think our factory enjoys the unique distinction of being the only independent company doing a large business in this commodity in the world.

2994. Has there been any attempt on the part of that combination in Europe to control the prices?—That is the object of the combination. I should, perhaps, explain to the Commission that up to 1908 there were several factories—both European and English factories—competing in the Australian market, and these were cutting each other's throats and selling explosives at unprofitable rates, but they finally agreed to bury the hatchet, and sent circulars to the large consumers in Australia to the effect that on and after a certain specified date their explosives, of whatever origin, would cost 15*s*. to 20*s*. a case

more. The Australian mines realised that there was no longer to be any competition, so they set about to find an independent producer of explosives from whom they could draw their supplies. They approached our factory and asked if we would supply their requirements of explosives, in fact, they invited us to enter the market, and we consented to supply the Australian mines with explosives. We have been fighting to develop a decent trade ever since 1908, but, of course, directly our products put in an appearance the Nobel Trust combined their forces to crush us out of the Australian market, and I may tell you that they went so far as to obtain or to purchase, practically, the whole of the shipping space in vessels going to Australia, *viâ* the Cape, and which could transport our goods, and we were then forced to purchase our own ship in order to execute our contracts. After the first year's operations the Chairman of the Broken Hill Mines reported to the shareholders that the advent of our explosives on the market had saved them no less a sum than 125,000*l.* sterling.

2995. Do you think those figures are approximately correct?—Yes, I think so, because the consumption in Australia is, roughly, 175,000 cases per annum, and it was the intention of the Trust to increase the price of explosives from 15*s.* to 20*s.* per case. Well, that would be from 150,000*l.* to 175,000*l.* per annum.

2996. **(Mr. Lorimer.)** Is the United Kingdom the only part of the Empire from which explosives are admitted into Australia duty free?—Yes, so far as I am aware.

2997. Who are your competitors, apart from the manufacturers in the United Kingdom? The manufacturing factories in Germany.

2998. Is there any competition from any of the other Dominions?—No.

2999. Does the Canadian Explosives Company ship anything to Australia?—No. The reason for that is that practically the whole of North America is controlled by the Dupont Powder Company, and the whole of Europe and Australia—the rest of the world, in fact—is controlled by what is called or known as the Nobel Trust. There is an arrangement between the Nobel Trust and the Dupont Powder Company which prevents competition.

3000. But the Canadian Explosives Company is really a branch of the Nobel Trust?—Yes, I believe it to be.

3001. It occurred to me that, if they were to compete with you direct, they would have to pay the 5 per cent., but if they shipped to England first and from there to Australia, it would be a different matter?—I am not quite clear on that point, but I think in that case they would have to declare the country of origin.

3002. Well, you seem to carry on this business in a way that really amounts to this: Your cost price, plus expenses, and a certain profit is what you want to make, and anything above that which the price affords would go to the benefit of the consumer?—Yes.

3002a. It is hardly for us to interfere in a question of tariffs, but what are your buyers in Australia doing to help you?—Nothing.

3003. **(Chairman.)** Are the Australian mining companies doing anything?—They have made representations from time to time to their Customs Department, but so far absolutely without success. The cry has always been that black labour enters into the manufacture of our explosives, and Australia is a white man's country.

3004. **(Sir Jan Langerman.)** I understand you have to pay a duty of 5 per cent.?—Yes.

3005. In making up your invoices, do you put the duty on or do they put the surcharge on?—When we first sent our explosives to Australia, the Customs Department were not prepared to accept our invoices as representing the *bonâ fide* value of the explosives concerned, because they took the view that we were dumping goods into Australia. Owing to the difference between our landed cost and the cost quoted by our competitors, they adopted a scheme for arriving at the value for Customs purposes, which amounts to this: They added from 3*l.* to 5*l.* per ton to the *bonâ fide* value and levied 5 per cent. on that basis, so we have to pay duty on this enhanced value.

3006. Then, it was not due to the fact that you employed black labour that they put on this extra 5 per cent.?—I am unable to answer that question.

3007. **(Sir Alfred Bateman.)** I do not understand whether it is the law you are complaining of or the administration of the law, because, if it is the law itself, I, for one, do not consider that it comes within our reference, because we cannot ask them to change this law, but if it is the administration then, possibly, it may be otherwise?—It is the administration.

3008. Whether it has been a mistake or whether they do not comprehend all the facts, I understand you claim that under the existing law they are not obliged to charge you this 5 per cent. extra?—Yes, that is my point. The principle of reciprocity is established between the two Colonies, and there is already in existence a very large free list. Australia sends goods to South Africa, amounting to a very large sum of money, every year, on which the Union rebates to Australia about 45,000*l.* per annum, whereas our exports to Australia are practically nil, and the consequence is, that the Australian Government rebates to the Union Government only about 800*l.* to 900*l.* We claim that they should carry that principle of reciprocity a little further.

3009. As I understand, from my experience of treaty and tariff measures, reciprocity has to be under like conditions and is not absolute; their point seems to be that your product is made by black labour?—I know they have argued the labour point.

3010. At any rate, your claim is that, under the existing law, it would be competent for the Australian Government to let in your articles at a lower rate?—Yes.

3011. **(Mr. Lorimer.)** I wanted to ask how many people you employ in your works?—About 1,000.

3012. To what extent would your industry be increased if this duty were removed?—We, at present, export a matter of 16,000 to 18,000 cases a year, and this trade might be doubled.

3013. Do you ship them to Australia?—Yes.

3014. And do you pay the difference?—Yes.

3015. What is the consumption in that country?—About 175,000 cases.

3016. So you supply about 10 per cent. of their consumption?—Yes.

3017. And I understand you could increase your exports and so give more employment here?—Yes.

3018. Your position in the matter is, that the duty, if it were taken off, would not go into your pockets but would obtain for you larger business, and having obtained a larger business you would, naturally, reap a larger profit?—Yes.

3019. **(Mr. Campbell.)** Have you made any representations to your own Government to have the explosives put on the list of preferential articles?—Yes, since 1908.

3020. And you say they have tried and failed?—Yes.

Mr. John William Jagger, M.L.A., Wholesale Merchant, and President of the Cape Town Chamber of Commerce, called and examined.

(*For evidence of this witness on "Exhibitions," "Statistics," and "Legislation," see pp.* 124, 127, *and* 181; *and on "Land Settlement and Irrigation," "Steamship, Post and Telegraphs," "Harbours and Coal for Bunkering," "Empire Development," and on "Fruit," see pp.* 6, 60, 102, 160, *and* 317, *of* [Cd. 7706].)

3021. **(Chairman.)** We shall be glad of your opinion with regard to the Trade Commissioner system?—I can only speak of my knowledge of the Trades Commissioner in Cape Town who represents the United Kingdom, and the one in England representing South Africa. As regards the one at home, we think he has done a great deal of good and has found fresh markets for our products, and also given a lot of valuable information as to packing, &c. I think that was one of the best appointments ever made by the

Government. And as to the one in Cape Town, who represents Great Britain, I think he has also done a very good work.

3022. Have you any improvements to suggest in the system?—No, I do not know of any special improvements. I see the suggestion has been made here in this report that more of these officials might be appointed, but I am not so sure about South Africa. Of course, you have only got about five big trading centres in this country.

3023. **(Sir Alfred Bateman.)** You mean whole-time Trades Commissioners as against the system of Trades Correspondents?—I think the Commissioner is better than the Correspondent.

3024. Would you have another Commissioner at Johannesburg?—No.

3025. Do you think that the Trade Correspondent there is quite sufficient?—Yes, I think that one man in South Africa is quite plenty.

3026. Do you speak from the importers' point of view?—I speak from the point of view of an importer.

3027. I mean from the point of view of the British manufacturer pushing his goods as against foreign competition?—Yes, largely. I do not think, myself, that in South Africa there is room for more than one man.

3028. There is no office in Johannesburg?—I do not see any difficulty about it.

3029. Do you think it would be sufficient if there was a subordinate official there?—Well, he could have a subordinate officer there. He could not be going round every day to these people asking for information. For instance, when he comes down to me I am always glad to give him all the information I can, and I suppose that others do the same, but if he came to me every day perhaps it might be another story.

3030. He is home every two years, and goes round to Manchester and other places, and tells the manufacturers what he has seen and what prospects there are for expansion in the market here. You will agree that that is a good thing?—Yes. But, of course, as you know yourself, the difficulty of getting an English manufacturer to adapt himself to new requirements is very great. He will not touch the business except it is on a very large scale. Take this particular case, where the Commissioner has been successful in regard to German prints. Of course, we bought these goods in Germany, and we never worried where we got them from as long as we got them at the right price. But now, of course, it is the duty of the Commissioner to go further than that and to interest the British manufacturer in the making of them. We might have done it in a sort of way, but if the British manufacturer declined we did not worry any further. But Sir Sothern Holland has persevered and got the British manufacturer to take them up.

3031. And do you not think that is the right thing?—Yes, most decidedly; but there is one class of stuff in which he has not been successful, and that is coloured cotton blankets. There is a very large import of these goods into this country from Belgium, and up to now the English manufacturer has not taken them up.

3032. You do not care very much where they come from as long as you can sell them?—No. Naturally, we are like all Englishmen. We prefer to get our goods in the Mother Country, if we can, but it is not our business to teach the English manufacturer his business.

3033. It is Sir Sothern Holland's duty?—Yes, and I think he has done a good work. But what I do say is this, that I do not quite agree with the suggestion in pressing, so far as South Africa is concerned, for more of these officials.

3034. **(Chairman.)** Now about the subject of an Empire trade mark; are you prepared to speak on that?—I have given some thought to it. It strikes me that it would be far more useful in regard to foreign or Continental or South American countries than it would be here. For this reason. We get certain manufactured goods from foreign countries, but the big bulk of our manufactured goods comes from the Mother Country. What we do not get from there are articles like coffee, sugar, timber, and things of that character. I think the idea is a good one, but I do not think it would be so useful here as it would in countries which did not get the same proportion of stuff from England that we do. The bulk of my imports comes from Great Britain. Why should I want to have all that stuff marked?

3035. So you do not think that if the scheme were adopted it would lead to considerable expansion of British markets?—No, I do not think so. I see no special benefit. I was struck with what you said in your Second Interim Report, which is very much the feeling in this part of the world.

3036. It is on page 53, paragraph 128?—Yes. It exactly represents the position in South Africa.

3037. **(Mr. Sinclair.)** Is there anything that you can tell us about your local industries that you have not touched on in your evidence on other subjects?—No, I do not think so.

3038. Is there a feeling of sympathy on the part of the people here with local industries and local products?—Yes, I think so.

3039. As regards dealers who retail products such as bacon, and provisions of that sort, will they be satisfied with the same margin of profit on the local article which they are selling as they are willing to take on the article they import?—I should say they would not get such a good profit on the local article as on the imported. That is the general experience. What rather puts the dealer in many cases against the local article is that he cannot rely so much on getting it regularly and of standard quality. If you get your shipments from over sea, it is different. Take butter, for instanec, or cheese; you know the standard quality of that article when imported, and that it will be the same all along.

3040. **(Sir Alfred Bateman.)** That is one of the difficulties against which local produce has to struggle?—Yes.

3041. You think that, broadly, there is a feeling of sympathy with your own local products?—Yes, most certainly.

3042. **(Mr. Campbell.)** With regard to the Empire trade mark question, was your Chamber represented on the 1912 Conference in London?—Yes, I think so.

3043. And was your Chamber in favour of the Empire trade mark when the question came up?—I could not say.

3044. But the Chamber arrived at no decision?—No. It has never been very much before us. We have never gone deeply into it. The bulk of our manufactured goods comes from Great Britain, and I think that is perhaps the greatest reason.

Cape Town, Thursday, 5th March, 1914.

Mr. W. J. Egan, Canadian Government Trade Commissioner, called and examined.

3045. **(Sir Alfred Bateman.)** You are Trade Commissioner for the Dominion of Canada, in Cape Town?—Yes.

3046. How long have you had that post?—Since the 1st June.

3047. And where were you formerly?—At Manchester, England.

3048. Who preceded you here?—Mr. Chesley.

3049. Had he been here long?—About seven years.

3050. I think your offices are next door to those of the British Trades Commissioner, are they not?—Yes, in the same building.

3051. I suppose that fact helps you both?—Yes, is assists in co-operation.

3052. Can you give us any idea of the trade between Canada and South Africa?—For the year 1913,

our total trade with the Union of South Africa amounted to 3,474,371 dollars. Our fiscal year for 1913 ended on the 30th of April.

3053. Can you tell me what the imports and exports were? Can you divide the three millions?—That was our total export.

3054. Then can you give me the chief articles?—Living animals, flour, wheat, cereal foods, carriages and carriage parts, motors, canned salmon and sardines, fruits (which are chiefly apples), lumber, wooden-ware, metals, and manufactures of all kinds. That is including our agricultural machinery exports.

3055. Are those large now?—Yes, for 1913, including metals and minerals, 458,000 dollars.

3056. How much of this represents agricultural machinery?—Say about three-fourths of that. Say 335,000 to 340,000 dollars. That is a rough estimate. I can give you figures of agricultural machinery for the six months of the 1914 fiscal year.

3057. Can you give us in the next day or two a table showing the chief articles?—Yes.*

3058. Do carriages and carriage parts include motors?—Yes.

3059. Now, as regards other imports?—Fish, canned salmon, sardines, fruits—that is apples—metals and manufactures, furniture, musical instruments, paper—news, printing, and wrapping—wood, including boards and deals, and manufactures of wooden wares of all kinds. These are our own direct exportation figures. But a certain amount of Canadian goods come *viâ* England, which do not figure in these. So our trade is a little larger really,

3060. So it may be nearly four million dollars?—Yes.

3061. Now, as regards the imports to Canada from South Africa?—The total for 1913 was 272,000 dollars.

3062. Of course, that is very much less?—Yes, for 1912 it was 384,000 dollars. It dropped considerably, because in 1912 there was 240,000 dollars' worth of sugar imported from this country, but none last year.

3063. You get it now mostly from the West Indies?—Yes.

3064. Can you give us the chief articles you import?—Yes. Furs and manufactures of, hides and skins, other than furs, wool and fancy goods. Those are the principal items.

3065. Now as regards the possibility of expansion of Canada's trade with South Africa?—The possibilities are immense from several points of view.

3066. You, I suppose, represent really the export from Canada to South Africa?—Yes.

3067. You do not, I take it, take much part in the imports into Canada?—Yes, they are helped very much. I have personally interviewed merchants in this country, and when I travel, I invariably bring to their notice opportunities in this direction. As you may know, our Department of Trade and Commerce issues a publication called "Weekly Report," and this is distributed each week to all merchants in Canada who are interested in trade and commerce, and free of charge; we are always prepared to give individuals assistance who may want it for the selling of their particular goods on our side, and our offices are always at their service for information of any kind.

3068. You find them agents in Canada?—Yes.

3069. Has the trade been increasing of late years—say for the last five years?—Yes, it has increased as follows:—

	Dollars.
In 1909 it was	1,679,000
In 1910 ,, ...	2,354,000
In 1911 ,, ...	the same
In 1912 ,, ...	2,495,000
In 1913 ,, ...	3,474,000

and for the six months of our 1914 fiscal year, the totals are 1,988,000 dollars, which is an increase over the same period of 1913 of 361,000 dollars.

3070. Does that include gold and diamonds?—No. We have none to send here.

3071. I mean on the other account?—No, unless diamonds would come under the head of fancy goods: I do not know.

3072. Do you register the diamonds in your statistics in Canada?—Yes, also gold and bullion.

3073. You register the gold and bullion, but you do not register the specie, do you?—Yes.

3074. In what particular lines do you think there will be an expansion of trade?—To here?

3075. Yes.—In lines shipped from the United States, whose productions and manufacturing conditions are very similar to our own. The shipping conditions are exactly the same—in fact, they are a little in our favour, owing to the direct steamship service which we have. As you know, our local manufacturing industries and productions in the Dominion are growing very rapidly, in fact they are now getting to that point when the production is beyond our consumption.

3076. In your manufactures?—Yes, in several lines. Many have already reached, and others will arrive in the near future, at that point when they will produce beyond the home consumption, and under those conditions, Canada is destined to enter the world's markets, and, of course, share in South African trade in a larger way than she has hitherto done. I am laying my lines broadly so as to secure for Canada some share of the United States trade to here.

3077. Is that chiefly in agricultural implements?—No. In machinery of all kinds—agricultural implements, dairy machinery, well-boring machinery, hardware tools, wooden-ware, paper, &c.

3078. Is there much for the mines? Implements and machinery?—We hope to figure in that pretty prominently. This is the first year that we have attempted it, and we have secured several orders in South Africa this year for mining and well-boring machinery.

3079. Will the Panama Canal have any effect on your trade with South Africa?—Not for some time, to my mind.

3080. Not in manufactures?—No.

3081. Your manufactures are all on the Atlantic side?—Yes, mostly. Of course, the Panama Canal will have the effect of creating manufactures on the Pacific coast, and it may come in time. But as to the direct benefit in the immediate future, I cannot see any. The opening of the Panama Canal is bound to be of immense advantage to Western Canada. It will develop industries in the western wheat Provinces,

* *The witness subsequently handed in the following table:—*

TOTAL VALUE FOR SOME OF THE PRINCIPAL ARTICLES EXPORTED FROM CANADA TO SOUTH AFRICA.

and British Columbia in timber, coal, fish, and agriculture, eventually developing manufacturing industries on that coast. However, for some time to come, this development can only be of value to the nearer markets, Eastern America and Canada itself, also the United Kingdom. As regards South Africa, there is no saving in mileage practically by the Canal.

3082. But you have water carriage all the way?—Yes, from our Pacific coast to South Africa. But I have never heard or seen an expert mention the South African proposition. For this reason I went over the map myself some time ago, and I found that coming down the coast and through the Canal and across to Cape Town there would be a saving of only about 200 miles, as compared with the route *viâ* Cape Horn direct.

3083. But it is a better voyage through the Canal, is it not?—It would be, but there are excessive charges. If there is only a saving of 200 miles, as you develop new trade routes, and open up channels on the other side, it would simply mean that we would have more ships going round the Horn. The only possibility is that, at some time or other, western Canadian productions may get to such a point that even the markets mentioned, including the eastern and others, will not be large enough, and there may be stopping places on the Eastern American coast which may make the Canal route to here desirable.

3084. But if the Panama Canal has the effect of developing your manufactures on the western side, there would be probably prospects of trade in these manufactures with South Africa?—Still, I am not yet convinced that it will come through the Canal, unless there is a calling place, because my idea is that the charges through the Canal would be much more than the increased mileage of 200 necessary in going round the Horn.

3085. Are you sure of that distance?—No. It is my own reckoning, I admit. But, as I said before, I have never heard any figures given by experts in connection with South African trade and the Panama Canal.

3086. How about freights from Canada as compared with the States, or compared with freights from the United Kingdom, say. Are the rates as low? I think they are about the same now from the States as from the United Kingdom, are they not?—I have not the figures from the United Kingdom, but from Canada the difference in rates to South Africa as compared with Boston and New York to South Africa is about half a crown a ton in our favour.

3087. About seven years ago there was a war among certain steamship companies, and then the rates were very low indeed from America to here?—Yes.

3088. But we have been told now that there is very little difference: the freight is about the same from New York to here as it is from Liverpool?—Yes, I have heard it too, but I have not gone into it.

3089. Have you got plenty of shipping between here and Canada?—Yes. Of course, our Government has subsidised the steamship company for 12 direct sailings a year. They, I believe, actually give us an average of 14.

3090. What line is that?—It is the Elder Dempster Line. In 1911 that direct steamship service carried 73 different commodities, filling the boats each time. In 1912 the number was 74, and in 1913 it was 85.

3091. I understand they fill the boats?—Yes.

3092. What do they do for return cargoes?—They go by way of the East. They generally go home *viâ* India.

3093. Is that a combine? Are the Elder Dempster people in combination with other services or can you send goods by any other line?—Yes, we may. A great many come *viâ* New York.

3094. You are not tied in any way to them?—No, they are tied to us. They must give us a certain service. We pay 146,000 dollars a year for that service.

3095. Does it include the mails?—If required, and also cold storage accommodation.

3095A. You will want cold storage both ways in time if you take a certain amount of fruit from this country?—We hope to do so in time.

3096. And the fish trade?—For this we do not use cold storage as much as for our fruit.

3096A. You carry fruit for about three months?—Yes, apples, and sometimes pears.

3097. What months of the year?—October, November, and December.

3098. Have you any other observations to make?—No, I do not think so.

3099. Are you in touch with the Chamber of Commerce here?—Yes, I am a member, and in touch also with the business men of the country. I do travel about the country and have interviews with them in regard to Canada and her manufactures.

3100. **(Mr. Campbell.)** What are the articles on which the Canadian Government gets preference in the South African Union?—On whatever Great Britain may get preference. It is the same schedule.

3101. So that it is an all-round preference?—Yes.

3102. I think you said in reply to Sir Alfred Bateman you did not think the Panama Canal would make any difference in the Western Canadian trade?—My statement was that I thought it would not make any difference so far as South African trade was concerned in the immediate future, only to this extent, that the creation of this new channel will mean that more people will establish themselves in business on the other side of the country, and it may affect them to a certain extent, but that market is bound to go to those countries which are nearer and larger, and which require more of our goods than South Africa. Of course, as it develops in future, it will come here also.

3103. Would it not put Western Canada on the same basis in regard to timber as Sweden, for instance?—I cannot see it. There is no saving in mileage to any extent, and I have not heard anybody mention the South African proposition in regard to the Panama Canal; that is why I went over the map, out of curiosity.

3104. I see that 30,000*l.* worth of timber comes into South Africa every year from Canada. I suppose that comes from Western Canada?—A great deal comes from British Columbia, and a great deal from the eastern side, which is chiefly pine shelving.

3105. Which way does it come?—From the western side it comes right round the Horn.

3106. Does all the stuff from Western Canada go round Cape Horn?—No, some comes by rail, and is put on board ship on the Atlantic coast. Timber is about the only proposition that is affected.

3107. I believe that recently the Board of Trade issued an order or regulation under which the Canadian Trade Representatives were allowed to make certain uses of the Board of Trade machinery in the Dominions and Canada. Has much use been made of that?—My understanding is that the assistance was principally in regard to Consular offices and not so much Trade Commissioners. Consular offices in foreign countries.

3108. Does not that apply to the Trades Commissioners?—No.

3109. **(Sir Alfred Bateman.)** Surely you could get help from the Commercial Information Office in London, and be put into communication with Trades Commissioners in Australia, say?—There is no necessity for that, because we have our own Commissioner there. I could almost insist that there is no mention made about the services of Trades Commissioners. My understanding of that report was that we could obtain information by applying to the Consular service.

3110. **(Mr. Campbell.)** I suppose the Commissioners do assist one another where they can, as a matter of fact?—Yes, in some ways we do.

3111. Is there any room for mutual assistance and benefit by working in co-operation between the Trades Commissioners of the Dominions and those of the Mother Country working in the Dominions?—In what particular way?

3112. Is there any direction in which they can assist one another in supplying information as to markets, for instance, and so economise?—No, the only proposition that I can see that would be useful was, as far as this is concerned, that they might give one another information about the demand for certain commodities which exists. We can work to advantage in that direction. For instance, suppose I know that a certain article is in demand, and Canada cannot supply it. I know that Germany makes it, and that Great Britain makes it; in that case I should certainly co-operate with the British Trades Commissioner by

pointing the matter out to him in case he should not have heard of it. But outside of that I do not know of anything.

3113. **(Mr. Tatlow.)** I presume that Canada has only one Trades Commissioner in South Africa?—Yes. Since I came here I have started a new system whereby I have correspondents, and just at the present time I have two, and I will eventually have more.

3114. In Johannesburg, I suppose?—I have one there and another in Durban.

3115. And how long has there been a Trades Commissioner appointed here?—We have had a Trades Commissioner for nine years or more.

3116. You mention the Elder Dempster Line and a subsidy of some 146,000 dollars?—Yes.

3117. That includes the carriage of mails when required?—Yes. But at present they are brought *viâ* England on a 25-day trip.

3118. It is only applicable then, as far as mails are concerned, to a subsidary service?—Yes.

3119. As regards freights between South Africa and Canada you are satisfied?—Yes.

3120. Are they fixed and regular in amount?—Yes; we have a schedule issued by the Steamship Company.

3121. Do all the steamship companies charge the same rates?—We have only the one company sailing here, unless a boat is specially hired on the Pacific coast to come round the Horn or, in future, perhaps, through the Canal. That is specially arranged

3122. **(Mr. Sinclair.)** You have told us that Canada's trade with the Cape has increased during recent years?—Yes.

3123. Can you tell us the principal lines in which the increase has been most marked?—Yes; you do not want the details but just an example?

2124. That is so.—Take 1912 and compare that with 1913. In 1912 the amount of exports from Canada of bread-stuffs—flours, wheats, and cereals—amounted to 1,113,000 dollars, and 1913 to 1,740,000 dollars. Automobiles jumped up very considerably, and minerals and metals increased from 396,000 to 458,000. Paper from 198,000 to 286,000.

3125. Can you give us any estimate of the comparative increase of trade during recent years in the case of Canada, on the one hand, and the United States on the other?—I could give the figures for 1912.

3126. It is satisfactory to know that Canada's trade has increased. I suppose you cannot say what the trade of the United States is?—I can secure that from the South African returns and make up a list.

3127. I think that would be useful, because one must have a comparison in order to estimate the true value. Can you tell us, approximately, whether Canada is holding her own in regard to increase of trade as against the United States or otherwise?—No, I cannot tell you that right off.

3128. I suggest that is an important comparison?—Well, it would depend on the total trade here. I worked on these lines in England, but I have only been here six months organising.

3129. If you could give us comparative information as to the relative increases of trade between Canada and South Africa, on the one hand, and between the United States and South Africa on the other during the last few years, I should like to have it?—Yes.*

3130. Can you tell the Commission what the preference that is granted on imports from Canada has amounted to?—I could not say off-hand, but you can get it from the South African returns in a minute.

3131. It has amounted to a considerable sum?—Yes; 3 per cent. of three-quarters of the total.

* *The witness subsequently supplied the following return in connection with this and the previous answers:—*

Imports into Union of South Africa.

From	1909.	1910.	1911.	1912.	1913.
	£	£	£	£	£
Canada	465,596	631,829	637,193	680,707	880,222
United States ..	2,115,236	2,663,083	2,828,025	3,314,776	3,776,307

Canada's proportion of total for 1913 is 2·2, an improvement of ·4.

United States proportion of total for 1913 is 9·4, an improvement of ·6.

3132. Now, are these prospective increases which you look for being helped by the fostering conditions which exist at present?—Yes; I have found the trade, generally, in South Africa to be uniform in the expression of their opinion that they would prefer to trade with Canada under equal conditions, so that on a basis of preference it is even better. I am speaking as compared with the United States of America.

3133. Sentiment counts for a good deal, but more favoured conditions will help. Canadian salmon comes here in fair quantities?—Yes.

3134. Does Alaskan salmon also come here?—Yes.

3135. In any quantity?—Yes, in fair quantities, but there is not enough of the other to distribute.

3136. **(Sir Jan Langerman.)** You have given us the imports from Canada. What are the exports to Canada?—The total last year was, roughly, 272,000 dollars.

3137. What does that consist of?—Wool, hides and skins, furs and manufactures of furs, and fancy goods.

3138. Is that an increase in quantity?—No, because in 1912 we imported from here 240,000 dollars' worth of sugar, but none last year.

3139. What about other articles?—They have all increased. Fancy goods were 39,000 in 1912 and 85,000 in 1913. Wool was 45,000 in 1912 and 86,000 in 1913. Hides and skins were 51,000 in 1912 and 93,000 in 1913. These are the principal articles.

3140. **(Chairman.)** You said you anticipated an increase of trade between Canada and this country. In what particular articles do you look for an increase?—Generally, in lumber and manufactures of, in metals and manufactures of. Of course, I am not speaking of produce; that is regulated a good deal by local conditions here. Our wheat is used for blending purposes only, but under conditions such as last year we shall bring in a great deal more.

3141. Your wheat is used for blending with local wheat or with Australian?—With both. I was going to refer to the evidence given to you in England about the question of gluten quality in wheat, but there is no necessity to do so. There is no need to contradict the statement, because it is well known in the trade.

3142. What size are these vessels of the Elder Dempster Line?— From six to ten thousand tons.

3143. Do you mean dead weight?—Yes; that is the registered tonnage.

3144. Is there any idea of getting a similar service from the Pacific coast?—Not at present—I have not heard.

3145. Would there be sufficient trade in the way of lumber to justify a service of that kind?—Yes, I believe that the development of the Province of British Columbia will eventually bring something of that kind about, but as that development comes along, in my opinion it will first serve other markets which are much nearer than South Africa.

3146. You mean where the comparative gain through the Panama Canal is greater?—Yes.

3147. You take the view that Trades Commissioners could not be of any definite value, I understand?—No, not that particular view. Do you mean the British Trades Commissioner?

3148. Yes.—To the advantage of Canada?

3149. Yes.—Well, I must say I do think that, if he were in a territory looking after our interests as well as those of the Mother Country and the other Colonies, he could not be of much use to Canada in particular.

3150. He might co-operate?—Yes, along the lines I have suggested he could co-operate, but one Trades Commissioner could not do justice to all parts of the Empire.

3151. **(Mr. Sinclair.)** Was any of the value of the increased imports that you gave us due to higher prices?—No, the prices are very much the same.

3152. In regard to news-paper for instance?—No, that has been under contract for some time.

3153. Has there been any increase in the case of Canadian agricultural implements?—Yes, and there will be a bigger increase in future.

3154. I mean in cost?—No, not in cost, but in quantity.

Mr. J. Solomon, Representative of the British Manufacturers' Representatives Association of South Africa, Incorporated, called and examined.

3155. **(Chairman.)** I understand that you appear on behalf of the British Manufacturers' Representatives Association of South Africa?—Yes.

3156. Your Association has a membership of 394 *bona fide* oversea representatives?—Yes.

3157. What are they?—They represent oversea manufacturers in this country.

3158. And of your members I see that 90 per cent. are domiciled in this country?—Yes.

The witness submitted the following statement:—

I. This Association has a membership of 394 *bona fide* oversea representatives, 90 per cent. of whom are domiciled in this country, and 70 per cent. are married.

II. Existing licences are:—

Cape Province.—Yearly, for representing one firm, 50*l.*, and for each additional firm represented, 5*l.*; not exceeding 100*l.* in all; with a rebate of 50 per cent. for domiciled agents.

Transvaal Province.—10*l.*

Natal Province.—10*l.*

Orange Free State Province.—20*l.*

If the neighbouring territory were included, the additional licences would be:—

Southern Rhodesia.—30*l.*

North Eastern Rhodesia.—30*l.*

North Western Rhodesia.—30*l.*

Tati Concession.—5*l.*

Total, 95*l.*

In 1908 the Merriman Ministry proposed that the Cape Colony licence be double the above figures, but upon representations from this Association they agreed to the above fees, which have been in force ever since.

III. *Licences in other British Possessions:*—

British India.—No special regulations or taxes exist.

Australian Commonwealth.—No special regulations or taxes exist.

Western Australia.—No special regulations or taxes exist, but he is liable to a general Income Tax of 4*d.* in the 1*l.* on profits, which are estimated at 5 per cent. on gross sales.

Tasmania.—No record of tax or provision as to licence being necessary.

New Zealand.—No special licence.

Canada.—No licence, except for sale of liquor and tobacco.

Newfoundland.—No licence required.

British East Africa.—No licence required.

Ceylon.—No licence required.

Cyprus.—No licence required.

Gibraltar.—No licence required.

Hong Kong.—No licence required.

Malta.—No licence required.

IV. *Licences in Foreign Countries:*—

Argentine Republic.—There are various taxes, viz., Buenos Ayres and National Territories; and again in the Provincial Provinces.

Austria and Hungary.—No licence.

Belgium.—Reciprocal conditions.

Brazil.—No Federal Tax.

China.—No licence.

Denmark.—For one firm only, 9*l.*; and for each additional firm, 4*l.* 10*s.*

Egypt.—No licence.

France.—Reciprocal conditions.

Germany.—Nominal licence of 1*s.* per annum.

Italy.—No licence.

Netherlands.—No licence, strictly speaking.

Norway.—5*l.* 11*s.* per month.

Russia.—Personal licence, 5*l.* 5*s.* 6*d.*; and for firms represented, 15*l.* 16*s.* 7*d.* There are also further small provincial charges.

Switzerland.—Licence issued gratis for legitimate business.

United States.—No licence.

From the figures given it will be seen that the licences of South Africa exceed the total licences charged by the remaining portions either of the British Empire or even the whole world.

South Africa, in view of its small white population, has a limited trade area as compared with other of His Majesty's Dominions, whilst it has the highest cost of living and imposes on oversea representatives the highest trade licences.

We have approached the Government yearly since 1908 to reduce these high licences, and were promised by Mr. Hull, during his term of office, that a Government Bill should be introduced reducing them. It did not, however, materialize. A Licences Consolidation Bill, framed on the findings of the Financial Relations Commission, has been drafted by the Union Government. Appended is a copy of letter addressed to the Minister of Finance and copy of his reply.

We would also point out the enormous expenses incurred in travelling this country. From a careful computation, an agent's expenses for railway fares, railway excess baggage charges, hotel accommodation, offices, sample rooms, shipping agents, dock dues, cartage, &c., is 750*l.* The estimate for domestic purposes is 400*l.* yearly. This money circulated by agents is a considerable sum and is spent out of income derived entirely from oversea manufacturers whom they represent and not from a profit on goods sold. Thus, these high charges not only press heavily on the representative, but tend to act as a restraint on trade.

Annexure.

Copy of Letter, dated 22nd January, 1914, addressed to the Honourable J. C. Smuts, Minister of Finance and Defence.

(*Begins.*) I beg leave to bring to your notice the question of licences imposed on agents of foreign firms.

During Mr. Hull's tenure of office as Minister of Finance, this question was considered very fully by him, and he assured this Association that the question of licences would be gone into by Parliament and redress granted.

Last year we were again assured that a Bill would be brought before the House, but, owing to great pressure of other matters, no opportunity was found for its introduction.

The licences at present in force for agents of foreign firms are as follows:—

Cape Province.—Yearly, 50*l.* For each additional firm represented, 5*l.* Maximum licence, 100*l.*

Transvaal.—Yearly, 10*l.*

Natal.—Yearly, 10*l.*

Orange Free State.—Quarterly, 5*l.* (Three months from date to date.)

and we feel sure you must recognise the inequality of these charges, which in the aggregate are more than a British agent would be called upon to pay in licences in a tour of the world.

We understand that a Licence Consolidation Bill is already drafted, in accordance with the Financial Relations Commission, and my Council will be glad to have your assurance that the above Consolidation Bill will be brought before the House during the coming Session. Awaiting the favour of your reply and thanking you in anticipation. (*Ends.*)

Copy of Reply, dated 27th January, 1914, received to above Letter.

(*Begins.*) I am desired by the Minister of Finance to acknowledge receipt of your letter of the 22nd instant, and to inform you that, if circumstances permit, it is the intention of the Government to introduce consolidating legislation on the matter referred to during the coming Session, but it is not possible at this date to give a definite assurance to this effect. (*Ends.*)

3159. **(Chairman.)** The gist of your evidence is that you desire a reduction in the cost of existing licences?—Yes. As an agent for foreign firms.

3160. And you have brought evidence to show that the existing licence is higher in this country than in any other British possession or foreign country?—Yes, all the world put together.

3161. And under your present law the licence is different in each of the four Provinces, I understand?—Yes, it is 50*l*. in the Cape Colony if you are domiciled, and twice as much if you are not domiciled.

3162. You have made representations to the Union Government on this subject?—Since 1908.

3163. What satisfaction have you got?—Before 1908 Mr. Merriman wanted to double this licence. He was under the impression that we were not domiciled here. Then he reduced the licence to what it is at present. It is 50*l*., but in the Transvaal it is only 10*l*., and we do as much business up there as we do here, in fact more.

3164. Have you got any hope of obtaining a consolidation and a reduction of the fee?—We know that an Act has been drafted about fifteen months, but what we want to do is to get that Act brought before Parliament during the present Session, as otherwise, if it is not passed before next year, we will have to pay that licence again. The trouble is that this is a licence for foreign firms and we are not foreign. We represent British firms. We shall be perfectly satisfied if it is a Union licence, but it has been issued for the last two years as a Provincial licence.

3165. You are anxious that we should support you?—Yes.

3166. Have you anything of special interest to tell us about the development and progress of British manufactures over here?—The British manufacturer is losing ground in this country.

3167. Owing to what?—To the enormous amount of duty on the imported article, and more so on account of the preferential railway rate for goods of local manufacture. Take, for instance, articles such as soaps, candles, and syrups, which are made here, a great preference is given by the railways on those goods.

3168. Given to whom?—The Colonial manufacturers. We were given to understand by the Government that when Parliament met last year they were going to do away with this preferential rate and increase the duties. In other words, there is some confusion on account of the difference which arises. For instance, a man is manufacturing syrup and wants to sends it from Durban to Charlestown and another man is manufacturing in the Transvaal and wants to send it down to Charlestown. Both of them want a preference rate, but in opposite directions. Then in sending goods from here to Johannesburg or from Durban to Johannesburg, if you send them from Cape Town you have a preference rate on the railway, and Cape Town does not come off very well as compared with Natal with the shorter distance.

3169. Have you discussed this matter with the British Trade Commissioner here?—No.

3170. Would he not be a suitable authority to refer to?—I think we have given him information on these matters from time to time.

3171. Would he not be in a position to assist you?—The Government seem to be on the other side of the fence. They say that we want to assist the Colonial-made article.

3172. But the Trade Commissioner here, to assist the imported article, would he not be the best channel through which to approach the Government?—We have never approached him on that subject, but we have given him other information; we are a body of men who represent different manufacturers.

3173. I would suggest that you approach him?—Yes.

3174. **(Mr. Tatlow.)** You say that you deal in imported soaps?—Yes.

3175. And you say that a preference rate is given to the locally-made article?—Yes.

3176. Is there any locally-made soap in Cape Town?—Yes, Lever's.

3177. And they get a lower rate to the interior?—Yes.

3178. The imported article is invoiced from Cape Town. It is not a through rate from oversea to the interior?—No.

3179. About what is the difference for, say, a distance of two or three hundred miles?—From three to four shillings on a hundred pounds box of soap.

3180. **(Sir Jan Langerman.)** Do you think that it is unreasonable on the part of the Government to foster local manufactures by giving a lower rate?—Well, as a representative of home firms, I think we should meet each other, considering this is a British Colony.

3181. Do you not get an advantage over foreign goods imported here as representing British manufacturers?—No. Of course, there is a slight preference given to British manufactures over foreign manufactures, but the preference is not so great that it will cope with the enormous duty we have to pay. The duty on articles in the grocery line is practically 25 per cent. on the home cost.

3182. You say that this licence is higher than in any other part of the world?—Yes.

3183. Do you come into competition with the existing trades in the country?—No, we simply take indents for the home manufacturer.

3184. From the merchant himself?—Yes, from the wholesale merchant.

3185. Is there a merchant's licence in this country?—Yes, an importer's licence.

3186. What is that licence?—When you have imported 1,200*l*. it is 10*l*. per annum.

3187. How does it compare with the licences which are charged elsewhere and which you say are less than here?—As regards the importer's licence I could not say. We are simply dealing with the traveller's licence. We are really representatives of the home manufacturer and we find that the licences we have to pay in South Africa all together are more than what a representative of a manufacturer at home would have to pay to travel all over the world. For instance, in the United States there is no licence required.

3188. Can you tell us what the reason for such a high licence was?—Yes, Mr. Merriman wanted to have it imposed at the time the Income Tax was raised in 1908.

3189. Is it for raising revenue?—Yes.

3190. You cannot tell me if the importer's licence is higher than elsewhere?—No, we have nothing to do with that. We simply carry samples with us and sell on indent through London buying houses.

3191. Would not your licence bear any relation to the importer's licence?—No.

3192. Because, if the importer's licence is higher in this country than elsewhere, you cannot complain if your licence should be higher too?—No. Ours is given to enable us to ply our calling and to take orders from wholesale merchants. The merchant's licence is on a sliding scale according to his turnover.

Mr. W. J. Laite, General Secretary to the South African Manufacturers' Association, called and examined.

3193. **(Chairman.)** I understand you are General Secretary to the South African Manufacturers' Association?—Yes.

3194. What are the points which you desire to bring before the Commission?—The points are set out in my statement, which is as follows:—

Statement relating to Manufacturers in South Africa.

Before attempting to frame answers to the list of questions submitted to the South African Manufacturers' Association by the Dominions Royal Commission, relating to manufactures in the Union, it is

deemed advisable to present a statement as to the general industrial conditions which exist in South Africa. From the questions asked, it is evident that the adoption of such a course will prove of service to the Commission, as it is essential that an enquiry of the important nature contemplated in the terms of reference should be founded upon a sound knowledge of the economic conditions of each separate Dominion or State.

In comparison with other Dominions of the Empire, South Africa may be said to be industrially in an embryonic state. Many of the manufacturing industries about which the Commission seeks information are non-existent, some are in a crude stage of development, whilst others may be said to have "arrived" commercially in so far as they are able to hold a goodly share of the local market by the aid of certain restrictive tariffs under which they are operated. It is somewhat difficult for those who are unacquainted with South African history to understand why the country, speaking industrially, lags so far behind her sister Dominions. The explanation is two-fold. In the first place no country in the world has been so handicapped in the industrial race of nations. Prior to May, 1910, territory which was geographically one country was artificially divided and was cursed with eleven different forms of government; and an account of them all in their various aspects—administrative, judicial, financial, and political—would fill an encyclopedia, without assisting the Commission. A number of these areas were under the control of the British Colonial Office, as many are to-day; but, omitting these from consideration, South Africa possessed four separate Governments, with four separate Parliaments, legislating, according to their lights, for the well-being of that portion of our common territory which had been relegated to their control. Experience having demonstrated the need for a common fiscal policy, a makeshift arrangement was brought into being under the somewhat grandiloquent title of "The Customs Convention." This Union, whilst providing for internal free-trade between the four self-governing Colonies, agreed upon the imposition of certain duties for revenue purposes, and in 1906 accepted the principle of protection by imposing duties of a restrictive nature upon certain goods in order to encourage the development of manufacturing industries. The system was only satisfactory from the fact that, whilst it existed, the various Governments were prevented from embarking on a policy of commercial hostility towards one another, but, as it was impossible to count upon a longer period of fiscal tranquillity than twelve months—which was the time-notice required for withdrawal by one or all parties to the Convention—manufacturers found it inexpedient to risk capital in erecting buildings and laying down plant which might, owing to a change in policy, be rendered valueless. The policy of the Customs Convention was fixed behind closed doors, by certain Ministerial representatives of the various Governments, and was then submitted to each local Parliament for ratification. The detail was not open for discussion—it had to be accepted or rejected—and the elected representatives of the people were powerless. A refusal to ratify on the part of any Parliament would have plunged all four Colonies into an internecine war of tariffs, with all its attendant evils, and on the principle of choosing the least of two evils, ratification followed as a matter of course. A meeting of the Customs Convention usually degenerated into a war of wits, and the victory was with the strong. It was impossible to contend for principle, and the conflict of interests between the inland and coastal States being so great, expediency and compromise had perforce to govern every decision. It will at once be seen that under such circumstances, without stability or continuity of fiscal conditions, industrial development in South Africa has been very severely handicapped.

The second contributing cause is the lack of trained skilled labour. A manufacturer opening business in South Africa has necessarily to import his skilled labour, and afterwards to undertake the training of such local labour as is obtainable. Until a few years ago, little or no effort was made to train technically the youth of the country, and, as skilled labour is always migratory in a new country, ever seeking new openings at higher wages, the problem of keeping the factory running and of producing articles of a standard quality at a cost which would enable them to compete with similar goods produced oversea under totally different economic conditions, has been a hard one for manufacturers to solve, and it has been responsible for closing down many promising ventures. Generally speaking, wages are from 30 per cent. to 50 per cent. higher in South Africa, both for skilled and unskilled labour than they are in Europe, whilst administration and other overhead charges are also proportionately higher. On the other hand, the industrialist in South Africa has considerable advantages due to climate, light, &c., which count in maintaining the health of workers.

Another contributing cause to the slow development of manufacturing in the country is lack of capital. South Africa, in popular estimation, has been so long considered pre-eminently a land of gold and diamond mining, and has been so dominated by those interests, that its other activities have been practically ignored by British capitalists, and as a result an utterly false appreciation of its economy has become current. Had this not been so, and with the abundance of raw material exported annually to the world's markets, South Africa would, ere this, have become a great producer of manufactured goods. She has immense deposits of iron ore, the value of her wool and mohair is admitted, and with an enormous supply of hides, with plantations of wattle, she can produce leather in quantities and of a quality second to none.

Before closing this general statement, it may be interesting for the Commission to know that, although no reliable or official figures are available, it is estimated by those best capable of judging that to-day there are between 30,000,000*l.* and 40,000,000*l.* sterling invested in manufacturing industries in South Africa, excluding the amount of capital invested in the Government railway and harbour workshops, &c.

Answers to Questions.

Question 1.—What was the total number of factories of each class carrying on operations on January 1st (or other convenient date) in each year from 1901 onwards? What was the number of persons employed (distinguishing men, women, and persons below 18 years of age), and what was the annual output of each class of product?

Answer.—No reliable official figures are available of later date than the Census of 1904. In February, 1913, the South African Manufacturers' Association prepared a report upon the industrial conditions of the country in relation to the Union tariff, and an attempt was made to secure the latest information from the Census Returns for 1911. At that time the returns were in the hands of the Government printers, but in response to enquiries by wire certain figures were supplied, but they were obviously incorrect. A second telegram to the Census Department, drawing attention to the errors, elicited the following reply:—

Union of South Africa,
Pretoria, Census Office,
8th January, 1913.

Sir,

With reference to your telegram to Mr. Canham, which has been forwarded to this office for reply, I regret to inform you that the Industrial Statistics collected in connection with the 1911 Census cannot be considered as reliable.

Many of the returns were unsatisfactory and, judging from the totals, a number of establishments have been omitted.

Diamond mines, collieries, and railway workshops were included among the Orange Free State's industries in 1904. These were not included in 1911, the mines being shown separately.

I have, &c.,
A. W. Carruthers,
Acting Director of Census.

W. J. Laite, Esq.,
68, Shortmarket Street,
Cape Town.

Under these circumstances it is only possible to submit the figures from the Census Returns of 1904, which are as follows:—

Industries.	Number of Institutions.	Value of Machinery and Plant.	Value of Material Used.	Value of Articles Produced.
		£	£	£
Aerated water factories, &c.	298	267,059	219,508	531,410
Asphalters and paviors and bottlemaking works	6	4,982	11,472	40,830
Beer-bottling and carbonic acid gas works	3	2,977	8,487	16,250
Blanket manufacturers, dye and cleaning works, &c.	16	7,077	1,696	8,420
Boot and shoe factories	172	9,936	72,279	124,034
Bread, biscuit, and confectionery works	292	148,664	988,857	1,435,467
Breweries and distilleries	54	417,301	570,925	1,166,574
Brick and tile, glass-bevelling and silvering, clay and earthenware works.	351	364,984	207,332	719,526
Builders and contractors, carpenters and joiners	475	186,763	1,816,953	3,223,596
Cabinetmakers and upholsterers, woodcarvers, basket-makers, cork works, bedding and mattress-makers, &c.	128	25,797	140,780	286,324
Cement and lime works, quarries, and monumental works	154	85,794	134,382	313,341
Chemical works, match factories, tar works, and salt pans	72	81,897	94,361	173,577
Coffee, chicory, and tea factories	19	23,200	73,985	158,091
Dairies, creameries, cheese, and margarine factories	23	28,676	62,647	84,826
Die sinkers, engravers, and india-rubber stamp-makers	17	3,927	2,855	12,645
Dynamite factories and gunsmiths	10	596,425	325,390	472,845
Electrical engineering works	33	694,792	65,365	244,258
Fish-curing and preserving works	16	8,625	16,768	24,469
Fruit preserving works and jam factories	6	25,500	93,500	156,500
Gas (acetylene and coal) works	6	392,630	107,940	170,550
Grain mills	359	506,566	2,759,414	3,305,179
Ham and bacon-curing works	3	7,579	34,100	42,250
Harness and saddlery makers	123	13,621	74,027	150,627
Ice factories and cold storage works	40	164,865	117,775	100,043
Iron and brass foundries, tin and copper smiths, lead pipe factories, wire workers, makers of tools and implements, gates and fencing material.	267	294,359	528,687	1,033,521
Jewellers and watchmakers	84	9,057	18,211	55,773
Laundries	23	7,508	9,552	51,262
Motor and cycle works	75	7,486	26,920	62,150
Picture-frame makers	20	1,190	13,582	29,343
Printers, bookbinders, and cardboard-box makers	192	448,006	286,181	1,131,853
Sail, tent, and tarpaulin makers	14	9,855	32,164	46,999
Saw mills, cooperage, turnery, and spoke works	141	258,183	407,506	805,834
Ship and boat builders	2	15,213	1,717	6,267
Soap works, bone mills, &c.	12	12,851	55,310	67,189
Sugar factories	34	373,167	145,923	418,544
Tanneries and wool-washing establishments	38	79,053	297,616	380,980
Tobacco factories	85	51,429	291,236	415,210
Vinegar, sauce, and pickle factories	6	1,350	3,682	7,654
Waggon and carriage builders, blacksmiths, locksmiths, &c.	595	147,065	528,332	994,069
Unenumerated	514	20,869	559,406	824,110
Total	4,778	5,806,278	11,206,823	19,292,690

It may also serve a good purpose to add a summary showing the relative position of each Province, and the value of its industries:—

Colony.	Number of Institutions.		Value of Machinery and Plant.		Value of Material used.		Value of Articles Produced.	
	No.	Per cent.	£	Per cent.	£	Per cent.	£	Per cent.
Cape Colony	2,527	53·0	2,280,336	39·0	5,843,593	52·0	9,040,579	47·0
Natal	749	15·0	1,408,342	25·0	1,892,408	17·0	3,683,608	19·0
Transvaal	1,353	28·0	1,920,471	32·5	3,247,611	29·0	6,289,402	32·5
Orange River Colony	149	3·0	197,129	3·5	223,211	2·0	279,101	1·5
	4,778	100·0	5,806,278	100·0	11,206,823	100·0	19,292,690	100·0

Since these figures were published, a number of new industries have been started, and others have developed. These include the manufacture of brushes and brooms, cloth weaving, diamond cutting, box making, basketware, cork manufacturing, groceries sundries, pickles, chutney, &c., glass bevelling and engraving, lead pipe works, photographic mounts and materials and papers, ferro-prussiate papers and linens, &c., pottery and tile making and tinware of all kinds.

No figures are available as to the number of persons employed, but the Government, through the Department of Commerce and Industries, has made an abortive attempt to secure such information. For the information of the Commission, I attach a form,* marked "E 18," which was distributed freely through the country, but being a voluntary document, issued without legislative authority and unbacked by penalties for non-attention, numbers of manufacturers refused to supply the information asked for, or allowed the matter to go by default. Certain figures were ultimately published by the Department which were absolutely incorrect, and the South African Manufacturers' Association advised its members in future to refuse all such information until it was made obligatory by law for every manufacturer to supply the details demanded. This Association has frequently urged the Government to pass a compulsory Industrial Census Act, as it has always recognised the value of correct statistics.

Question 2.—Please say is there any tendency for any of the above industries to expand or decline? What are the chief causes operating to produce the result?

Answer.—Since 1906, when duties of a restrictive nature were put upon certain goods, there has been considerable development in the particular industries affected, viz.:—Printing, jam making, confectionery, milling, cigarette and cigar manufacturing, soap and candle making, harness and saddlery, playing card manufacturing; whilst a number of small industries have been brought into being under the *ad valorem* duty of 15 per cent. On the other hand, very little progress has been made in such trades as engineering

* Not printed.

and its allied interests, owing to the difficulty of competing with oversea products, which have the advantage of cheaper labour, highly organised factories, and a free market to operate for superfluous output.

Question 3.—What other industries could suitably be developed to work up raw materials which are already produced in the Union, or could be produced or procured under profitable conditions? What obstacles, *e.g.*, lack of (*a*) capital; (*b*) labour; (*c*) means of transport, have hitherto prevented the development of these industries?

Answer.—There are very few industries which could not be operated successfully and profitably in South Africa, providing suitable economic conditions are obtained. Those for which the raw material exists in abundance in the country are woollen manufacture, tanning, boots and shoes, iron, diamond cutting, jewellery, wattle extract, clothing, cereal food products, &c.

The chief obstacles are (1) lack of capital; (2) lack of skilled labour; (3) need for cheaper facilities for getting goods from the point of production to the point of consumption, which can only be remedied by the Government introducing the system of "commodity rates" on the State Railway; (4) protection by means of a restrictive Customs tariff against the products from oversea.

Question 4.—What Government assistance or encouragement is given to the manufacturing industries, *e.g.*, by means of loans, bounties, preferential railway rates, Customs duties, &c.? Do local authorities encourage the establishment of factories by granting temporary exemption from rates, or according other privileges?

Answer. — The only assistance or encouragement given by the Government to manufacturing industries is through Customs duties, which applies to a limited number of industries, a detail* of which is attached to this statement, showing the duties at present levied and the duties demanded by manufacturers. No loans or bounties are granted, neither are they sought. In a few instances preferential railway rates are granted in the Cape and Natal Provinces; these are not general throughout the Union, and it is understood that when the Union Tariff is revised they are to be abolished.

It is understood that the Durban Municipality, possessing certain lands, grants sites at low rates to manufacturers, and also undertakes the supply of power, light, and water at specially reduced fees to industrial concerns for a limited period after commencing operations. The Cape Town Municipality under its new ordinance have taken powers to grant special facilities in the way of cheap water and power, but, having no lands, nothing can be done in the way of granting sites upon special terms. No case where special facilities have been granted has ever been brought to the notice of this Association.

The undersigned, having been authorised by resolution of the executive committee of the South African Manufacturers' Association, will be prepared to attend the Commission as a witness, to answer questions to the best of his ability, it being the desire of the committee to render the Commission the best assistance in its power.

I am prepared to give any further information that lies in my power.

3195. **(Chairman.)** We have all read your statement with interest. What is the total capital invested in your industries?—I can only give that approximately, but it is estimated by our Association to be between 30 and 40 millions sterling.

3196. What is the number of hands which you employ?—There we are absolutely in the dark. We have tried for many years past to induce the old Cape Government and, later, the Union Government to have an industrial census taken, but we have been unsuccessful.

3197. Your Association does not compile statistics itself?—No, because all the manufacturers do not belong to our Association. We have 331 members. They represent the larger firms, but a great many firms all over the Union do not belong to our Association.

3198. Can you say what percentage your membership represents to the total?—There is another association in Natal which represents about 150. There is another in the Transvaal which represents 147, I think. Of course, this is the largest manufacturing centre in the Union, and we have the largest number of members.

3199. You say that the chief obstacle to the development of your industries is, first of all, the lack of capital?—Yes.

3200. Why is that?—Simply because the capitalists of Europe have never had reason to have confidence in the industrial possibilities of this country.

3201. Have you not local capital?—We have no new capital except what is brought from oversea.

3202. Has not capital accumulated in South Africa?—Yes, but it is largely invested in property, in mortgage bonds, and not in industrial concerns.

3203. It seeks a certain and not a fluctuating return?—Yes.

3204. Is there any tendency on the part of local capital to interest itself in industry?—Yes. Where we have had the advantage of restrictive tariffs we have been able to get capital to develop our industries, but it is purely a question of security for the capital.

3205. You also allude to the lack of skilled labour?—Yes.

3206. What is that. Do you mean white?—Yes. There is no skilled coloured labour in this country. When we refer to skilled labour we mean the high type of artisan. We always have to import him.

3207. I suppose you say he is very dear?—Yes, we pay, as you will see later on, very high wages for skilled artisans. The figure varies from 30 to 50 per cent. in advance of the wages paid for similar labour in Europe.

3208. I think that figure is even less than the figure which was given in the report of the Economic Commission?—Yes, but I have tried to err on the right side.

3209. Do you see any prospect of that expense being diminished in future?—No, and I do not think that it would be to the advantage of the country if it could.

3210. Do you say, as regards coloured labour, that it cannot be considered in any way as skilled?—No. It largely depends, of course, on the definition of the word "skilled." It requires a certain amount of skill to boil sugar, but we would not consider sugar-boiling to be a skilled occupation. We would call an engineer a skilled man. There are various branches of the confectionery trade where labour is introduced of a semi-skilled character, but which could never be called skilled in the ordinary sense of the word. We should call it labouring work, and it is done by coloured men.

3211. And anything higher than that is not within the competence of coloured labour?—We have no proof. The nearest approach to that condition is in cabinet making. There you get the semi-skilled carpenter, but, generally speaking, the higher-grade work is in the hands of whites.

3212. Have you ever endeavoured to adapt native labour?—No, because our object has always been to employ white labour as far as possible.

3213. Your action has always been rather in the direction of restriction?—We have simply let the thing take its natural course. We prefer white labour where we can get it.

3214. You also allude to the cheaper facilities for getting goods from the point of production to the point of consumption, which can only be remedied by getting the Government to introduce commodity rates on the railways. I suppose you mean preferential rates?—No. The difference between the two is this, that the preferential rate only works one way. That is against the imported article going inland. Let me give you an illustration. We have in the Transvaal a large pottery factory in which something like 150,000*l.* has been invested. It is established there because the raw material is there. Now it is impossible for consumers in Cape Town, for instance, and other coast centres to use the products of that factory, because the cost of railage is excessive and indeed prohibitive. As a matter of fact, it is possible to purchase a set of toilet ware in Staffordshire and pay the freight to Southampton and the terminal charges both ways, also the sea freight, and land

* Not printed.

those goods in Cape Town cheaper than the cost of railage on the articles if sent from Johannesburg to Cape Town. Now we say that, this being a State railway, it should be used for the development of the resources of the country, and, our population being so sparse, it is essential that the article should be carried from the point of production to the point of consumption at whatever price the article will bear to enable the promoter of the factory to have the benefit of the largest market obtainable. To-day the market for Transvaal pottery is limited to the Transvaal itself.

3215. You would fix the railway rate at whatever figure the article will bear, irrespective of the cost of transit?—Yes. That is the system supported by Hugo Meyer and it has worked admirably in America and Canada. It has been utilised by competitive railways because they have secured far more freight by it. In Great Britain a similar principle has been recognised in connection with the sugar trade. As you may perhaps be aware, a Royal Commission sat on this question some time ago and that Commission decided that it was a good system. There was some opposition from the people interested in the sugar business in Liverpool, but the Royal Commission decided that it was in the interests of the consumer that this system should operate in order that the consumer could get his article so much cheaper.

3216. Your commodity rate differs from the preference rate, first of all, in working both ways and, secondly, in being based upon such a figure as will increase the traffic?—Yes.

3217. Is the local industry granted facilities by the Government or by local municipalities in regard to provision of land at low rates or by the provision of cheap power and light?—I have answered that question in my statement. I state that the only municipality that is able to offer any facilities in this direction is the municipality of Durban, because that is the only municipality which owns land. Cape Town has taken powers to assist industries by reducing the cost of electric current for power and water charges. But I know of no case where that has been done.

3218. In what towns can you get electric power?—In all the important towns of the country.

3219. At what rates?—It varies. In Cape Town lighting is 7*d*. and power is 3*d* per unit. In Durban it is very much cheaper. I think lighting is 4*d*. or 5*d*. and I believe they supply power at about 1½*d*. In East London the charge is somewhat higher than in Cape Town and the same in Port Elizabeth.

3220. Those are all fairly high prices for an industry to have to meet?—Yes, they are.

3221. **(Mr. Lorimer.)** It is rather unfortunate for us that you are unable to give any statistics as to the number of industries later than 1904. Have you yourself any idea, broadly speaking, to what extent these have increased?—Are you now referring to the Cape Province or to the whole Union?

3222. To the whole Union.—It is impossible to give even a guess, but we know there has been a considerable increase because of the number of new firms that have started since 1906 when the restrictive tariff was introduced. In this town alone, we have the United Tobacco Co., with a very large capital, which was brought into existence as a result of having a heavy duty put on the manufacture of tobacco and cigarettes. The same thing applies to other centres. In Port Elizabeth you have a large number of firms representing a capital of nearly 500,000*l*., which has been laid down there during recent years to develop the leather and boot and shoe industry. There are some industries the increase of which is more marked than others.

3223. And the leather trade is one of them?—Yes.

3224. And you say there is probably between 30 and 40 millions of capital now invested in industrial enterprise in this country?—Yes.

3225. Has that capital been provided by South Africa?—Only a portion. The larger proportion has come from oversea.

3226. Can you say, speaking broadly, whether it has been a remunerative investment?—I think so.

3227. We are told here that it is desired to have a properly prepared industrial census. What answer has the Government given to your representations on that point?—We have had nothing from the Government.

3228. You say that the Association has frequently urged the Government to pass a compulsory industrial census act? You have had no answer?—We have had an abortive attempt made on the part of a department called the Department of Commerce and Industries, which is now practically moribund, to secure some returns, but the attempt was a purely voluntary effort. A certain form was sent out to a list of manufacturers. The list was anything but complete and a large number of manufacturers simply refused to give the information because, in the first place, there was no guarantee that it would be treated as confidential. It was looked upon as an attempt on the part of the authorities to get behind their backs with some ulterior motive. There was no law to make it compulsory on every manufacturer to give the information, and, therefore, it was concluded that it would be unfair to expect one individual to give information that his neighbour was not obliged to give. But the worst feature of the case was that the Government, through this particular department, did publish certain figures which had been collected and those figures did the cause of industrialism in this country a great deal of harm, because they were incorrect. For instance, they represented that the capital invested in industrial enterprise had increased while the use of raw material and the output of goods had decreased during the same period, which was, of course, absurd.

3229. Would you say that the amount of capital invested in industrial enterprise is in proportion to the increase of population more or less?—There has been no increase of population comparatively speaking for the last ten years. The white population has decreased because we have not had sufficient avenues of diversified employment.

3230. You can do no export trade?—No, except a small amount with German South-West Africa.

3231. What you want is to encourage your industrial enterprise above all things?—Yes.

3232. **(Mr. Campbell.)** Is coloured labour used in your factories to any extent?—Yes, very largely.

3233. Does it adapt itself to skilled processes?—No. The experience is that it does not adapt itself; it has not the capacity.

3234. Is that an incurable trouble?—That is common experience. I have gone into this question very deeply from time to time and I have a report here which I submitted to the Government last year. The experience of the manufacturer is that the coloured man is a very good asset for unskilled or semi-skilled work, but higher than that he is not of much value.

3235. Does he adapt himself to machine work?—Yes, to a certain extent, if it is plain straightforward work such as cutting planks in a saw-mill.

3236. Is the match-making industry of any size in this country?—Yes, it is very large.

3237. It is not included in these returns. Has it been planted in all the Provinces?—We have one factory here and one at Kingwilliamstown, and also one at Durban.

3238. Can they manufacture matches here for export?—Only for home consumption. Of course, there is a heavy tariff on matches and they have a monopoly.

3239. In regard to ham and bacon-curing works, I see they turn out a total of 42,250*l*. What is the reason that South Africa does not manufacture more bacon, seeing that she grows the corn?—That is largely accounted for by the fact that the farmer has never considered it worth his while to go in for breeding the right pig. I may mention that some Johannesburg capitalists are operating an industry which has been started at Wellington. These people are importing stock for the purpose of breeding suitable pigs and making bacon. They anticipate that in a few years' time they will be able to supply the local market.

3240. You think that a bacon industry ought to be very profitable in this country?—Yes. In discussing this subject I would like to say in conclusion that, in connection with local industries, this country is totally different from any other country in the world. It has been cursed with a set of conditions such as no

other country has had to face. It has never had an opportunity of developing on sound scientific lines in the same way as Canada, Australia, or New Zealand. In the first place its territory, which is geographically one, has been split up into 11 different forms of government. We have had to work under a Customs Convention that was only a make-shift arrangement to meet a set of conditions that nobody in particular was responsible for. Now, it stands to reason that when you have four self-governing Colonies, and a number of Colonies controlled from Downing Street, all with their own various policies and ideals and methods of working, without having any regard to their neighbours' necessities, no defined policy of development could have been put into operation successfully. If it were decided to prosecute a campaign of agricultural or industrial development in that part of the country where agriculture or manufacturing was most fitted for expansion, that proposal would probably be opposed by the mining element or other people who were interested in securing different fiscal conditions. The advent of Union has given us the first opportunity we have had of being able to work out our salvation economically. The Government has done very well, but it has not yet had time to complete its work. From a very close study of the conditions of South Africa, I do not think there is any other country in the world which offers the industrial possibilities of this country when we have had a chance of putting our house in order.

3241. And the reason why the hog has not gravitated towards the corn is——?—Because he has not been here.

3242. And I suppose much the same thing applies to butter?—I think the reason for the laxity or lack of development in the dairy industry is largely accounted for by the fact that in days gone by it has never been the policy of the Government to provide the necessary equipment to enable the farmer to get his products from the point of production to the point of consumption. The consequence has been that we have had, from time to time, instances brought to our notice where butter produced at Darling, which is a place about 50 miles from here, has been selling there at 6*d.* a lb., whilst at Cape Town 2*s.* 6*d.* a lb. has been charged by the retailer.

3243. That is largely due to the want of co-operation in manufacture?—Yes, and to the lack of proper railway cold-storage facilities.

3244. I suppose the main difficulty is that the manufacture has been left in the hands of small farmers?—Yes.

3245. But I understand that more assistance is now being given in the direction of co-operation?—Yes, and it is succeeding very well.

3246. **(Chairman.)** Your complaint is, I understand, mainly as to the absence of industrial statistics?—Yes.

3247. What department would it come under?—That is largely a matter of administration, but I think it should come under the Minister of Industries.

3248. You consider that statistics would be of great value?—Yes, not only to South Africa but to the Empire. I should like to point out in regard to this coloured question, one favourable feature, to which we attach a great deal of importance and that is this, that coloured labour is indigenous to the country. It never moves away, whereas white labour is migratory. When there is a slump in one place it goes elsewhere where wages are better.

3249. Are there any other points?—No, unless you wish to ask any further questions. I would like to put in this publication,* which deals with the whole of the industries of the Union and which will give the Commission much information.

* Official Souvenir of the South African Industrial Exhibition, Cape Town, February, 1914 (Supplement to "South African Commerce and Manufacturers' Record," February Issue, 1914).

Kimberley, Wednesday, 18th March, 1914.

Mr. John Orr, Deputy Mayor of Kimberley and Member of the Kimberley Chamber of Commerce, called and examined.

(*For evidence of this witness on "Cables," see p. 75 of* [Cd. 7706].)

3250. **(Chairman.)** Do you represent the Chamber of Commerce?—No, but I am a member.

3251. Do you speak for yourself?—Principally for myself.

3252. I think you wish to speak in regard to competition between English and foreign goods?—Yes. I have a note here, "Articles in which foreign countries enter largely into competition with British manufacturers: Ladies' underwear, prints (German), flannelettes, shawls, cotton clothing (workman's), blankets (cotton), fancy goods (toys, dolls, &c.), boots and shoes. The percentage of imports, from personal experience, is as follows:—British, 85 per cent.; foreign, 15 per cent." If there is any question which the Commission would like to ask about these particular articles I have mentioned, I will be pleased to answer it. From my own experience, the percentage of imports is, 85 per cent. British manufacture, and 15 per cent. foreign manufacture. That refers to imports in my particular line.

3253. What is your particular line?—Drapery, clothing, and fancy goods.

3254. Are those proportions constant, or is the English proportion increasing or diminishing?—Well, in the case of the experience I have gathered from some of the large wholesale houses here, the percentage given is rather different from the figures I have here, inasmuch as they reckon about 10 per cent. of foreign imports represents their particular class of trade. But, as I said, I am not in the same line, they are more concerned in heavy goods.

3255. Confining yourself to your experience, is the proportion of British goods maintained?—I think so.

3256. Is it improving?—I could hardly answer that question, as I have not gone into the figures as to what obtained, say, twelve months ago. I am taking the figures more at the present date. I do not think it necessary to go back to compare the figures with those two or three years ago.

3257. What are the other points you wish to bring forward?—I have a special note with reference to the boot trade in this country, I will read it: "British goods have without question the largest sale in South Africa, and compared with foreign goods are able to hold their own for durability and style and workmanship. In American footwear there is a considerable trade done; this is not due to cheapness, compared with the British, but owing to the very deep, earnest, and determined resolution of American manufacturers to put an article on the market combining style and fit. The art of lastmaking, from a scientific point of view, is vastly keener in American than, up to recent times, in British factories, but we find British manufacturers are now alive to the necessity of this important fact, and are combining to produce the fit as well as the style. Cheap American and Continental goods are not in such demand, and comparatively few, as compared with British, are asked for by customers. There are people who will have nothing but an American boot, just as there are those who will have nothing but a British or Colonial article. At the same price, we are of opinion that British goods are fully equal to American." I may say that this is the opinion of one large firm here which deals largely in footwear in this district.

3258. **(Mr. Sinclair.)** You spoke of the competition between English and foreign goods, and you gave

the proportions as 85 per cent. and 15 per cent. Do not you think that is a very satisfactory proportion of British trade?—Yes.

3259. You were not putting it before the Commission as, in your opinion, an unsatisfactory condition?—No.

3260. **(Sir Jan Langerman.)** In connection with this 85 per cent. of English imports in the face of American competition, does it apply to the boot trade as well?—I do not know about the boot trade, whether it would be included in that.

3261. Would that be 85 per cent. as well?—Do you mean, would it include boots?

3262. Yes.—No, my figures do not include any American boots.

3263. You say that the British manufacturer of boots would get 85 per cent.?—Well, I am hardly in a position to give figures with reference to boots, but I should say, roughly speaking, 85 per cent. to 90 per cent.

3264. I am referring specially to the boot trade, where you said there was a larger competition?—As I mentioned in connection with this note which I have read, this is from a gentleman who is more conversant with the American boot trade than I am myself. I cannot very well give the proportions of the American boots as compared with British manufactures.

3265. Do the British goods enjoy any preference over foreign goods?—Yes, in the matter of duty, 3 per cent.

3266. I am thinking of this 85 per cent. of British goods. Do you think that is due to this preference or to superior manufacture?—I think, perhaps, it is due to both; most people in costing goods to sell at a certain price take into consideration the 3 per cent. rebate.

3267. As well as to superior manufacture?—Yes, there is always something characteristic about British goods and foreign goods. You can tell whether they are British or not by the appearance of them. Some people have a fancy for a certain article, not because it is British or foreign, but because it has taken their fancy and meets with their requirements.

3268. So, given the preference in favour of British goods, and also supposing that the British manufacturer can place on the market a better-made article than the foreign goods, there is no reason why the British trade to South Africa should not increase and the small margin of 15 per cent. be wiped out practically?—Well, I do not know about that; there are certain articles that the British manufacturer does not seem to be able to produce. There are certain lines which are established in this country. Attempts have been made by British manufacturers to get those particular lines, but they have not met with any great success.

3269. So that there would be very little chance of shifting the percentages?—I think there would be very little chance. I am speaking, of course, of lines that are largely used and not articles of fashion. These are staple articles of trade that people have got into the way of using.

3270. **(Mr. Garnett.)** Then the general conclusion that you have come to, from what you say, is that people will buy what they want irrespective of the country that produces it?—Yes, I think so, we are very seldom asked whether goods are of British manufacture or foreign manufacture, that does not often enter into the question.

3271. Generally speaking, goods have to fight their way into the market by their own inherent excellence?—Yes.

3272. You mentioned certain cotton manufactures in which there was competition; would you mind giving me those again. I think you said underclothing?—Yes, ladies' underwear. This only refers to a particular article that is made principally in Germany and Saxony that the British manufacturers do not seem to have come into the market with to any large extent.

3273. Do you think they have not specialised so much in those particular pieces?—No, I think they have not.

3274. What is the next?—German prints. These goods are principally consumed in the country by the natives and the Germans have got hold of that trade very well, so that it would be very difficult, I think, to take it from them.

3275. I think I am not incorrect in saying that up to a few years ago the English printing trade had been, more or less, in regard to design and finish, stagnant, is that not so—it had hardly launched out. What I mean to say is, that in finish and design it was not holding its own with German and French goods?—There may be something in that, but when I speak of these German prints, I am referring to the common article and not so much to what we call the article of fashion. Then, of course, there are foreign cotton goods that are manufactured on the Continent and which the English manufacturer does not seem to have made in large quantities.

3276. But is it then your personal experience that, of late years, the English cotton and calico printing trade in its higher branches has made considerable advances both in excellence of finish and also in artistic design? That is so.

3277. And you think that if they pursue that line there may be a further field in which they may extend their business?—I think so.

3278. What is the next item?—Flannelettes. This, perhaps, is not a large item, but there are a large number of flannelettes produced in foreign countries that are perhaps a little different in character from the ordinary English-made goods, and they do seem to have taken the fancy to a large extent; but here, again, of course, the British manufacturers have produced goods to compete with those articles that are more or less winning their way.

3279. I was going to ask that question, whether some years ago German flannelette in design and finish was of a much higher class than our own and whether our own manufacturers have not perhaps, to some extent, caught up with them?—Yes, to some extent I think they have.

3280. You said something about cotton blankets—are they in the class of cheap cotton blankets?—Yes, coloured and white.

3281. What is the next item?—Cotton clothing.

3282. What have you to say about that?—I think it will be the opinion of all who have experience that there is a large quantity of this cotton clothing, principally workmen's clothing, used in this country by the natives and workmen of a certain class, which is made abroad. Here, again, of course, we know that these articles have got a hold in the country, and it seems very difficult to oust them from their strong position.

3283. Can you say whether we are relatively losing ground or not?—I do not think we are losing ground. Most of the things I have in my mind are special classes of goods such as I have referred to. There have been articles brought forward which, to look at, you would say they were quite as good as the others, but certain brands have been on the market so long and are so well known to consumers that they will have those and nothing else.

3284. Would it be too much to say that, generally speaking, it is in the cheaper classes of goods that these foreign articles are most largely bought?—Yes, I think so. Speaking of woollen goods, I think the trade is very small.

3285. I am speaking of cotton goods.—Yes.

3286. Has any business been missed through English makers having to quote very long delivery?—That has not come to my personal knowledge.

3287. Because, as you know, the English manufacturers have been very busy?—Yes.

3288. Generally speaking, you think it is in the cheaper qualities of goods where the principal competition is?—Yes, and also in consequence of well-known brands that people are used to.

3289. Have you anything to say about foreign competition in woollens as compared to the English trade?—I think I could give from my own experience the opinion that there is a larger quantity of British woollen goods now used in South Africa than there was five or ten years ago.

3290. Then we have increased our trade?—I think so, from my own figures.

3291. **(Mr. Bowring.)** I think you led us to believe that in your experience you found that whereas in years gone by American and German goods had supplanted English goods, recently English goods had again come to the fore?—Yes, I think ground has been made up within the last few years.

3292. And that English manufacturers generally have shown a greater desire to meet the wishes of their customers, and so have increased their trade?—I think so.

3293. And you have no special cases to bring forward where English goods could be so altered as to give English trade a greater proportion than it has at present. Have you any specific instances?—I have no particular article in my mind at present. As I said before, the brand in certain articles has got a good deal to do with that question. People look on certain articles as standard articles, and will have nothing else.

3294. I suppose that when price and quality are about equal the Mother Country gets the preference?—Yes, in a good many cases.

3295. Sentiment, at any rate, would be in their favour?—Well, in some cases it would.

3296. Was it found, do you know, that American foot-wear flooded this market a few years ago in great quantities?—Yes, a number of years ago; I can remember that.

3297. How many years ago?—About twelve years ago.

3298. And since then you find the trade has rather gone back to the English goods?—I think a good deal of it has gone back, and I think that is due to the fact, as is pointed out in this paper, that the English manufacturers have woke up to the fact that there was a certain demand for a certain shape or fitting or a particular boot, and that they found it necessary to alter their methods in some respects and to design the style or fitting of the boot, or some aspect of the boot, in such a way that would appeal to the people, and especially those who had been in the habit of wearing American boots.

3299. And now in that particular line English boots compare favourably with American?—Yes, quite favourably.

3300. I suppose the same remark would apply to German cutlery?—Yes.

3301. English cutlery is now being produced as cheaply and as good as the German article?—I must say that I am not conversant with that particular trade; it does not come into my experience.

3302. Have you anything to add?—I have been asked to put in a letter as to the competition in certain other classes of goods.

[*Letter put in as follows.*]

Kimberley,
18th March, 1914.

Gentlemen,

We have the honour to submit a brief statement as regards the china, earthenware, and glass trades.

English China.—From what we observe, English china manufacturers appear to hold their own in better-class goods. There is a certain neatness in style and finish about the English product which appeals to the eye, and which is lacking in the Continental product.

German and other Continental manufacturers have entirely captured the market for cheaper grades of china. We are able to import a china cup and saucer, decorated with floral designs, at about the same figure as was paid for an English earthenware with a crude pattern.

The cheap badged ware, "A Present from Kimberley," appears to be entirely in Continental hands. We have often made inquiries from English manufacturers for this class of cheap ware, but have always been informed that they cannot make it.

Earthenware.—With regard to this branch, we should say that it remains almost entirely in the hands of the English manufacturer. The quality, price and style—especially of dinner ware and toilet ware—leave nothing to be desired. We don't know that the packing in this class of goods could be improved upon.

As already mentioned under the heading of china, the Continental firms have captured the market for cheap tea sets, cups, saucers, &c. They, the Continental firms, produce china goods at almost the same prices that English manufacturers ask for crudely printed earthenware.

Colonial-made Pottery.—These goods comparatively are well manufactured, but the output is like a drop in a bucket compared with the requirements of the country.

The contemplated rise to 30 per cent. duty would be a mistake, at least until this manufactory with a combination of others could supply the needs of South Africa.

The prices of both English and Colonial-made pottery are landed in Kimberley at almost the same cost.

Glassware.—English glassware, such as drinking vessels, tumblers, &c., is almost unheard of in Kimberley.

We conclude that the English manufacturers cannot produce at the price of their Continental rivals. We should say that 90 per cent. of all glassware coming to Kimberley is of Continental origin.

In heavier cheap glass a small trade is done in English glassware, perhaps 5 per cent. American glass may claim the other 5 per cent.

Vases, Ornaments—Glass and Otherwise.—These we buy solely from the Continent, as English makers do not appear to cater for this trade.

Packing.—Taking the trade throughout, the packing by Continental firms is superior. Take their tea ware, trinket ware, and fancy goods, each line is packed in parcels of half-dozens or one dozen, and is much easier to handle, to shelve, and to store generally.

Invariably English goods are packed loosely. Continental firms seldom charge for cases and packing. English firms invariably do.

J. Bradley & Son.

ORANGE FREE STATE.

Bloemfontein, Friday, 20th March, 1914.

Mr. W. Ehrlich, J.P., Vice-President of the Bloemfontein Chamber of Commerce, called and examined.

(*For evidence of this witness on "Railways and Harbours" see p.* 125 *of* [Cd. 7706].)

3303. **(Chairman.)** I understand you are Vice-President of the Chamber of Commerce here?—Yes, and a retired business man.

3304. You are good enough to give evidence on what subjects?—On the advisability of manufacturers in England establishing branches in these Colonies.

3305. Will you give us first the principle, and then add details as to the chief lines in which you think this could be done with advantage?—Of course, the question is really a general one. About two years ago, the Government here negotiated with one of the large carriage and wagon building firms at home to establish works in this country, in fact here in Bloemfontein, for the purpose of manufacturing rolling stock for the Government railways, also for Rhodesia. Whether the inducements were not sufficiently attractive, or for other reasons, I do not know, but the negotiations came to nothing. That made me think generally of the question of having branch factories in the Colonies so as to do away with the agitation which continually arises against the increase of Customs dues for the purpose of protecting or encouraging local industries.

Then we had two large British firms establishing works in this country—Messrs. Lever Brothers, Soap Manufacturers, and Price's Patent Candle Company. These are of great benefit to the country. Naturally, a large amount of capital is expended, and, furthermore, the article they make locally can be sold for considerably less than similar articles made in England. Levers' South African soaps are cheaper than the imported, and so are Price's candles. It seems to me that various benefits would be derived from that policy. In the first place, the cost of living would be cheapened. This was made the subject of a Commission of Enquiry lately, and it seems to me to be largely connected with the question of the establishment of manufacturing industries in this country. As long as we have to import everything the cost of living will be high. If we had local factories, a large amount of intermediate profits would be saved. At present I daresay there are always half-a-dozen intermediate profits to be made before the consumer gets hold of the article. If the factory was in the country, the only intermediate profit would be that of the retail storekeeper, who gets his supplies direct from the factory, and the article is bound to be cheaper. So even if the establishment of factories had to be encouraged by the Government, through bonuses or other forms of assistance, it would be an advisable step to take, in my opinion.

3306. **(Mr. Campbell.)** Do you think that, as far as the raw materials necessary for manufactures are concerned, South Africa is in a sufficiently sound position to manufacture against older countries?—Older countries generally import their raw materials—or a large proportion of them. Great Britain imports most of them.

3307. I am speaking of the distribution of coal for one thing?—It is sufficiently distributed.

3308. You have in your mind the manufacture of iron products largely, I presume?—No, not exactly. I have in my mind the manufacture of woollen articles and leather goods, and such-like commodities.

3309. Taking iron goods first, is there a distribution of coal and iron in the Union such that it could be profitably used for the purposes of manufacture?—In the Transvaal, coal and iron deposits are very closely situated, and as for iron and steel manufactures, a manufactory has already been started on the Vaal River, at Vereeniging, on the borders of the Free State and the Transvaal.

3310. In regard to the manufacture of wool, I understand that that can only be carried on extensively in colder climates, and not in warm ones: do you know anything about that?—No.

3311. Has any woollen manufactory ever been established in South Africa?—I think there was one many years ago at Pietermaritzburg, Natal, but it came to grief.

3312. What were the reasons that it did not succeed?—I do not know.

3313. How long since was that?—About fifteen or twenty years ago. It was probably before its time.

3314. You have established during the last few years, have you not, some industries, like that for the manufacture of candles, for instance?—Yes; candles and soap.

3315. And matches?—Yes.

3316. Are there any industries that you have in mind that you think could be successfully acclimatised besides those I have mentioned. Could you point to some industry that you think would give an opening for the employment of capital?—The tanning of leather, for instance.

3317. You produce the tanning material and the hides?—Yes.

3318. And, at present, is tanning at all widely carried on in the Union?—No, only at the coast near Cape Town.

3319. Do you know, or can you give any idea of, the value of the leather turned out in the factory?—No, we have no factories here.

3320. Has the local leather a good reputation?—Yes, for the commoner classes of work. Not for the best work, I believe.

3321. I suppose that boots as well as leather are imported into South Africa ready-made?—Yes, in large quantities.

3322. There is no great manufacture of boots here?—No.

3323. Is there any other industry besides the leather business to which you refer?—I mentioned the carriage works, because the material manufactured in this country, after having been stored in this country, is improved in value on account of the dry climate.

3324. But do you think that the encouragement of manufactures in South Africa, which, of course, would entail the expenditure of a large amount of money and require some assistance from the Government, is of such vital importance as the encouragement of agriculture?—No, the encouragement of agriculture is not necessary. It requires no encouragement. That is the natural occupation of men. The encouragement needed is only that which every man has—to make money. It requires no special encouragement, I mean from the Government, to help a man to go on to a farm and produce the products of the soil.

3325. Provided it pays?—Quite so.

3326. Does not the same thing apply to manufactures?—No; they require a large amount of capital, and different inducements, I should say. In agriculture, every man is for himself, to a large extent. But with manufacturing industries it requires a considerable capital outlay, and a large amount of labour and organisation.

3327. I do not know whether you have answered this question already, but apart from the imposition of protective tariffs, with which we have nothing to do, are there any means which you could recommend for the encouragement of manufactures in the Union? Is there any particular policy which you would like to put before the Commission?—The policy we have as a Chamber recommended is by protection through the Customs.

3328. Is there any other direction in which you suggest a step may be taken?—The only other means are bonuses on manufactured articles.

3329. **(Mr. Garnett.)** You have mentioned two large firms that have already established works here—Lever Brothers and Price's Patent Candle Company. Can you tell me what class of labour they employ?—Well, as far as Levers is concerned, they employ only white labour, except for the very rough work of loading, and so on.

3330. Can you tell me the character of the work that is done there—is any very high degree of technical skill required, such as you expect from the higher class of artisan?—It did not appear to me when I was there last year that they used much highly skilled labour. They have a large number of girls employed in packing soap.

3331. The process of making it is not highly skilled?—No.

3332. I suppose the same thing would apply to the kind of labour employed by Price's Patent Candle Company?—Yes.

3333. You may perhaps be aware that woollen and similar industries are highly specialised and technical industries?—Yes.

3334. And the people employed in them have to be very carefully trained. Can you say whether there is in this country an adequate supply of people—I won't say the trained artisan, because at the moment you have no industries—but assuming that a start were made and the necessary machinery imported and people brought out necessary to give the business a start, are you of opinion that you have a sufficient supply of the right kind of people who could be trained to these particular trades?—Yes, I think so.

3335. Where would they be found?—At present in the towns and on the farms. There are the younger sons of the farmers, who will very soon have to find other employment. The Government is establishing technical schools, so we are gradually training up young men for an industrial life.

3336. But that training would perhaps fit them more to take the position of overseers or managers, rather than skilled artisans working for a weekly wage?—Yes, but a large number are now working in Johannesburg for a weekly wage.

3337. And you think there is a sufficient number of that class to justify people starting industries here?—Yes, of course, you would have to bring out a few to act as teachers, but you would soon find sufficient material in the country.

3338. But I would suggest to you that if anyone established woollen mills in this country, for instance, he would not want to put up those mills as a kind of nursery, to nurse people into efficiency. He would want to start straight off and become an active producing unit. He would not be content in some near or far future to become a producing factor, and to enter the country and start work under those conditions?—Yes, I quite appreciate that. But at first he would have to bring out his workmen.

3339. And you are of opinion that there is existing a class in sufficient numbers from which an adequate supply of trained artisans could be produced?—Yes.

3340. They could be constantly recruited?—Yes

3341. There would be no falling off?—No.

3342. Do you believe that those who have been accustomed to a more or less free life in the country would be content to toil at the spindle and the loom?—Yes, I think so. I think there is a tendency even now for people to flock into the towns.

3343. You think that the attractions of town life will be quite sufficient?—Yes, and the necessity of earning a living. The earnings from agriculture are largely speculative, depending very much on the seasons. In the towns they have a more or less regular income, although it may be smaller. And then, of course, our native labour is a very great asset in regard to industries.

3344. **(Mr. Sinclair.)** What you advocate is that old established English firms should start branches of their businesses in the Union?—Yes.

3345. Is there any disposition on the part of the people of the Union themselves to start factories?—It seems not. Want of capital and want of experience probably keeps them from it.

3346. Take industries like those that have been started — candle-making and soap; was there not sufficient prospect of success and enterprise locally to make a start?—Yes, and small factories had been started, but only in a small way. But I think those firms I have mentioned must have brought out a large amount of capital in order to start on the lines they have, and our local men had not got that available.

3347. And you think it is better in the permanent interests of the Union that those industries should be started by outsiders, than that you should wait a little longer until you are in a position to start yourselves?—They start by being outsiders but they soon become insiders.

3348. But they are absentee proprietors, are they not?—At present all capital that comes from home is owned by absentees, but still the workmen are in the country and the money is spent here, or a great deal of it.

3349. But the profits, the dividends, are spent outside your Union?—Yes, but that will continue, I am afraid, for a long time.

3350. If you were sufficiently strong to organize these industries for yourselves, you would have not only the work but the profits besides?—Yes, that is true, of course.

3351. The conditions as regards the supply of labour would seem to be favourable to the setting up of industries by the people themselves, would they not?—Yes.

3352. I suppose that, as the people here grow in strength, it will be their objective to initiate suitable industries for themselves?—Yes.

3353. **(Mr. Tatlow.)** You said there was a tendency on the part of the sons of the agriculturist to flock into the towns and offer themselves for artisan labour. Apart from that, is there in the towns an increasing number of youths in regard to whom it is difficult to say what employment they can obtain?—Yes, they are now being trained to technical industries, and so on.

3354. I am thinking of the white population?—Yes.

3355. Is there an increasing number for whom it is difficult now to find suitable employment?—Yes, that is the case.

3356. And those would be well utilised in your industries?—Yes.

3357. And would they willingly become artisans?—Yes, I am quite sure of it, and work at artisan wages.

3358. You think that the field is open?—Yes.

3359. And it is rather a problem at present what to do with the growing youth?—Yes, in the town.

3360. **(Mr. Lorimer.)** Where are Levers' and Price's factories situated?—Levers' are at Durban and Price's at Cape Town.

3361. As they have to import the greater part of their raw materials, they would naturally go to the sea coast?—Yes.

3362. As most finished articles weigh when they are finished a good deal less than the raw materials of which they are composed, that is an adverse influence in respect to building factories up-country and thereby entailing railage charges?—Yes.

3363. So that most of your industries would probably be established at the seaports?—Yes; but we are urging the Government to modify the railway rates so as to neutralise that advantage which is in favour of the seaports.

3364. Now, in respect to leather, it is somewhat different; with the tanning materials up-country and the hides up-country, why is there no effort of production made on your own part, seeing that the raw material is all there?—Want of capital and want of knowledge, I should say.

3365. Of course, to establish boot and shoe factories and to fit them up with adequate machinery to compete with the rest of the world would involve a good deal of capital, but you could tan your hides without a great deal of expenditure?—The tanners want almost more capital, because the stock takes about six or nine months before it becomes fit to be used for leather.

3366. But in establishing boot factories, the same thing would exist, plus cost of machinery and the interest on the capital involved?—Quite so.

3367. Suppose factories were established in the interior, would you have any difficulty in keeping them supplied with coal at a moderate price?—No difficulty at all.

3368. What sort of rolling stock was it suggested two years ago should be built at Bloemfontein—railway carriages and wagons?—Yes.

3369. Was there an English firm here which had experience in that business, or would they send out their staff and start a branch here?—Yes.

3370. And what was the cause of failure?—Negotiations between them and the Government went on, and they wanted certain contracts from the Government for a certain number of years before they would start.

3371. And the Government would not guarantee enough work?—I suppose that was it.

3372. I do not know whether it was you or some other gentleman this morning who said that while the greater part of the imports into the Union are from Great Britain, you had to get large supplies of windmills from the United States?—Yes.

3373. Do you have these offered to you from Australia?—I do not think so.

3374. Because when I was in Rockhampton, Queensland, I was in a factory where they did a great business in windmills. They shipped them all over the country and they seemed to have enough power to export. They have never thought it worth while to come to South Africa?—No, it seems not.

3375. **(Mr. Bowring.)** Besides these soap and candle factories, there are other local industries, I suppose, carried on by local concerns—boot and shoe manufacturers and others?—Yes, and furniture.

3376. And what others do you know of?—Furniture, I think, is the only one.

3377. And these factories have been successful?—Apparently in a small way, but, in addition, you see there are very large quantities of these goods imported; therefore, it appears that they are not dealing with the actual requirements of the country.

3378. The locally-owned factories do not seem to expand at all?—No.

3379. And you rather think that the home manufacturers who are working in a large way could do it very much better than the local people?—Yes.

3380. Having more capital and better facilities?—Yes.

3381. In regard to raw materials for soap-making, have you any information that you could give us in regard to that?—No.

3382. You do not know the quantities of palm oil, for instance, supplied to these factories?—No, but that could be got from the Customs returns, I suppose.

3383. Or the quantities of whale oil?—No.

3384. But you would probably say that the greater proportion of soap-making materials are to be had on the spot?—A certain proportion. I should say the greater proportion. Ultimately it will come to that.

3385. You know, for instance, there has been a very large whale factory established on the coast here?—Yes.

3386. And much of that oil goes into soap-making?—Yes.

3387. And palm oil is a large factor?—Yes, it comes from the West Coast.

3388. So one would imagine that for soap-making you are in a very fine position?—Yes.

3389. And also candle-making?—Yes.

3390. **(Sir Rider Haggard.)** About this influx into the towns of which you have been speaking; is it going on to any considerable extent in this country?—Yes, it is lately.

3391. Do you look upon it as a danger?—It is a danger in so far as the people are lowered in their status in the town. They gradually sink from farmers to labourers.

3392. What class of people is it that comes into the town, the poor white?—Yes.

3393. The bywoner class you mean?—Yes.

3394. And you think that is an increasing movement?—Undoubtedly.

3395. Take your own district, has there been an influx into Bloemfontein?—Yes, they come from all over the Union here.

3396. I have been told that there is a certain reflex action from the towns to the land, but I would presume that that would apply to a few of the upper classes who go out of the towns?—Yes; I must say we have not noticed that reflex movement here.

3397. Do you think there is a sufficient population on the land that you can afford to spare them to go to the cities?—No, but somehow or other they cannot make a living on the land—that class of man.

3398. You think they come here because they think they can do better?—I suppose so.

3399. Do they, in fact, do better?—Yes, in one way. They get a smaller income, perhaps, but somehow it is more regular and certain than on the farms.

3400. Is that, perhaps, not due to lack of enterprise on their part on the farms?—Yes, and the bad seasons.

3401. Lack of energy?—Perhaps so. But the great factor is native labour. That is doing the work the poor white would have to do.

3402. You think it is because he comes into competition with the native labourer?—Yes, the farmer would rather employ the native labourer, because he can be freer with him than with the poor white.

3403. I suppose I should not be far wrong if I concluded that this movement is likely to extend rather than to lessen?—Yes.

3404. Would not the remedy be closer settlement?—We are working in that direction now, but it means capital.

3405. It would be a remedy?—Yes, we have urged the Government already, many times, to make farms available for these people.

3406. And, I suppose, you will admit that the danger in a wide country like this of crowding the population into a few towns is so great that it is highly desirable that such closer settlement should be undertaken and carried to a successful issue?—Yes.

3407. **(Chairman.)** What wages do these poor whites get in Bloemfontein which attracts them?—From 4*s.* to 7*s.* a day.

3408. For what kind of work?—Overseer work and unskilled labour.

3409. And that compares with what rate paid to natives?—The native gets from 2*s.* to 3*s.* a day.

3410. How do you measure the efficiency of the work of the two?—It is very difficult to measure that efficiency, because you are induced to employ the poor white to do this work often on sentimental grounds. You do not merely consider the economic principle.

3411. That is to say, you employ the poor white because you wish to give him a job, and not because he gives you value for money?—Not altogether.

3412. If you looked solely at the economic factor you would get the work done far more cheaply by natives?—Yes, that lower class of work.

3413. So, generally, the employment which attracts these poor whites to Bloemfontein is given them on sentimental grounds?—Yes, and therefore we want opportunity for them in the better kind of manufacturing industries, because they are quite able to do the better class of work.

3414. But would it not be more healthy for the State if means were devised for closer settlement or some other way of giving them employment on the land?—Yes, certainly.

3415. That would be preferable?—Yes, for their families and for their children in every way.

3416. You have alluded several times in the course of your evidence to the scarcity of capital?—Yes.

3417. What are the conditions regarding that here? Is capital very scarce for the foundation or assistance of legitimate industries?—Apparently, it is so. Whether the capital is scarce itself or the capitalist is averse to employing it in that direction, it is difficult to say.

3418. Is it a fact that the capitalist prefers to invest in land rather than employ his money in industry?—That is, unfortunately, the case.

3419. Unfortunately or fortunately?—I should say unfortunately, because, being a town dweller myself, I should like to see industries develop in the towns, but the capitalist is averse to employing his money in the town or in town property, generally. I suppose he thinks the stability or the measure of security is not so great as on the land.

3420. That might conceivably be a desirable development?—I cannot see how it can be, because after all there is a large population living in the towns, which are a great asset. They constitute a valuable asset to the country too, and that development ought not to be stopped.

3421. Might it not be possibly more so if they were in the country rather than in the towns?—Well, we cannot all be farmers.

3422. As regards the scarcity of capital, do you say the banking facilities of the country are inadequate?—I do not think they are inadequate, but their inclination to lend money in towns is not very pronounced.

3423. Are they more inclined to lay it out in the country?—Yes.

3424. Regarding the security as better?—Yes.

3425. At what rate can capital be obtained from the banks here on reasonable security?—From seven to eight per cent.

3426. And can money be obtained on mortgage in the country districts at a lower rate?—Six per cent. is the prevailing rate.

3427. That rate has remained stationary for many years?—Yes.

3428. Have you suffered much here from the world scarcity of capital? Have rates gone up here?—No, I cannot say that. They have always been fairly level. That six per cent. mortgage on a farm is always the prevailing rate.

3429. You are probably aware that in a great many countries the prevailing rate of interest has increased considerably during the last three or four years?—That is not the case here. The tendency has always been rather to curtail the employment of capital than pay a higher rate. Rather than raise money at eight per cent. a farmer would sooner wait till terms were more favourable.

3430. And you state that for the purposes of agriculture there is ample capital available in the banks?—Yes.

3431. Have the recent years of drought led to many cases of foreclosure, or difficulties between lenders and borrowers?—No, because a certain amount of patience is always exercised. The banks and lenders are well aware that unavoidable circumstances have been the cause of men being remiss in repaying their loans, and so they have given time.

3432. Is it within your knowledge that the land about here has risen or fallen in value during the last four or five years?—Yes, it has risen.

3433. And the effect of the recent three years of drought has not been to counteract that rise?—No. Really this year, the third year, has been the culminating point. Distress has not yet shown itself, but I

think there is a tendency for prices to go back a little, as people will not buy at present.

3434. Is the current price of land to-day higher than two or three years ago?—I cannot say it is lower.

3435. And compared with five or six years ago?—It is higher.

3436. **(Sir Jan Langerman.)** In regard to the mortgages on land at six per cent., they can get money from the Land Bank at five per cent.?—Yes, but the restrictions are so great that as a rule people do not avail themselves of it. The Land Bank only lends a certain limited amount, and I believe there are other restrictions on the borrowing of money from that institution, so the tendency has been that the capital available in insurance and other financial institutions is fully employed in farm loans.

3437. Every year the Land Bank comes to Parliament for a large sum, and a great many people are able year after year to make more use of the land?—Yes, and in spite of that, the six per cent. mortgage is largely availed of.

3438. Is it notorious that banks do not lend money for industrial purposes?—Yes, that is my evidence, and no financial institutions either, such as Insurance Companies.

3439. Now, in regard to mortgages, do you know of any case where a mortgage has been raised by a farmer on his farm, and that money went into the property to improve it?—That is generally the case.

3440. Is it not generally raised in order to pay off debts which the farmer has previously incurred. He raises that money in order to discharge these debts, and not a penny goes into the farm?—I will not say that. I think the money is raised for buying stock and other farming requisites.

3441. **(Mr. Sinclair.)** When you say that banks do not lend money to put into industries, are we to understand that a business man, if he wants to develop his industry, cannot get banking accommodation?—I think so. I mean to say he might get a temporary bank accommodation, but they will not finance him like, for instance, industries are financed by the German banks. We cannot get it.

3442. There are special facilities given there. But the ordinary facilities involve, do they not, financial assistance to the proprietor when he is seeking to develop his industry. Can that banking assistance not be got here?—They are alway averse to lend money as a permanent loan. They will probably grant an overdraft for a time, but they would not dream of sinking money in industrial undertakings for any number of years.

3443. But do they show any hesitation in giving overdrafts where there is a prospect of an industry being extended?—No, they are quite liberal in that way, but that is only a temporary accommodation.

NATAL.

Durban, Monday, 23rd March, 1914.

Mr. Alexander Buchanan, Chairman, and Mr. Walter Butcher, Vice-Chairman, of the Durban Chamber of Commerce, called and examined.

(For evidence of these witnesses on "Statistics, Weights, and Measures," see p. 127 of this volume, and on "Ocean Freight Rates, see p. 78 of [Cd. 7706].)

3444. **(Chairman.)** You have prepared a statement* on the question of arbitration awards?

Statement put in as follows:—

Arbitration Awards.

We desire to give expression to the feeling of this Chamber on the question of the need for recognised means of arbitration on matters in dispute between parties trading in the different Dominions of the British Empire.

The Dominion of South Africa is endeavouring to minimise the need of arbitration as regards its exports by the appointment of Government officials for the grading of maize, fruit, and other commodities.

As regards trade between the different Provinces of the Dominion in Colonial produce, Rules of Arbitration were adopted at the Associated Chambers of Commerce Congress held last year at Kimberley, which have been accepted by dealers generally.

Disputes that arise in regard to exports from South Africa to Europe are generally settled at the receiving ports without difficulty by means of arbitration.

In the case of imports into South Africa from other Dominions of the Empire, particularly from India, the absence of a satisfactory method of settling disputes, which only too often arise, in regard to quality and the proper carrying out of contracts, is very vexatious.

The principal imports to South Africa from India are gunnies and rice, which are shipped from Calcutta.

Gunnies (*i.e.*, grain bags and wool packs) are frequently found on arrival to be light weight and of inferior quality, and importers claim that the proper place to arbitrate on such disputed shipments is at the port of discharge, where the whole shipment can be inspected. Under existing conditions, however, it is necessary to return two unopened packages to Calcutta, nominated or selected numerically by the Bengal Chamber of Commerce, who appoint the arbitrators, and the award of those arbitrators is final as regards the whole shipment in dispute. This method is unsatisfactory, both as regards the uncertainty of obtaining a correct finding and also as regards the time spent in obtaining a settlement of the matter in dispute.

Rice is imported in different qualities, and in this trade a need is felt for the standardisation of official grading of the different qualities and for certified weights. The question has been taken up by the Executive Committee of the Associated Chambers of Commerce of South Africa, and is still unsettled; but in view of the attitude adopted by the Jute Growers' Association in regard to similar complaints and appeals from Hankow, Australia, and other importing markets, it is doubtful whether the representations made from South Africa will receive any more favourable consideration.

Vide extracts from Bengal Chamber of Commerce Report for 1912, draft form of Sale Note or Contract submitted by this Chamber to the Associated Chambers of Commerce of South Africa, and Rules of Arbitration for the Produce Trade of South Africa (all appended).*

To a small extent difficulties occur in dealings with other Dominions of the Empire, but, speaking generally, there is not the same difficulty in arranging settlements as is found in dealing with Calcutta shippers and with the Jute Growers' Association.

Uniformity in legislation regarding arbitration throughout the Empire is hardly possible in view of the very different conditions that obtain in the different markets; but any efforts or recommendations made by the Commission for the general provision and

* The witnesses also submitted a memorandum and letter as to Commercial Travellers' Licences, see Appendices I and II., pp. 175 and 176.

* Not reprinted.

recognition of the principle of arbitration by means of mutually satisfactory methods would doubtless be much appreciated by all importers and exporters in the Dominions of the Empire.

3445. I think it is probably within your knowledge that this subject is already in process of settlement between the Governments regarding arbitration awards?—**(Mr. Buchanan.)** I am not aware of it.

3446. The subject has been the cause of correspondence between the various Governments of the Empire and I think considerable progress has been made towards arriving at a solution?—We have had correspondence with the Bengal Chamber of Commerce extending over some time now, and we know that other markets importing goods from Calcutta have also had lengthy correspondence but without satisfactory result.

3447. Your point is to make arbitration awards more easy to obtain and more easily enforceable?—Yes. At present the arbitration between suppliers in Calcutta and importers in South Africa is arranged entirely from the point of view of the shipper or the supplier. In the case of arbitration regarding gunnies we have to return to Calcutta two unopened packages, which are selected by the Bengal Chamber of Commerce or the Jute Growers' Association, I am not sure which, and arbitrators are appointed by those bodies and their award is binding on the whole shipments under dispute. Our claim is that the correct place to arbitrate is the place where the goods lie and where the whole shipment can be inspected. Large numbers of claims arose last year in respect particularly to goods which were evidently packed in a damp condition and heated, and when they arrived here were more like tinder than anything else. The agents of the shippers were called in to examine these goods and they advised the return of a certain number of packages to show what the defect was, but our claim was repudiated. We have an informal offer from the merchants, not the suppliers, to share our loss, but in my case, for instance, I have declined to accept that settlement and I have called for a full recognition of my claim.

3448. Turning now to the subject of rice?—Rice is imported here in several qualities and a large number of European importers have gone out of the trade rather than continue with the unsatisfactory practices that obtain in the trade.

3449. What you desire is official grading?—Yes, and I think most of us would contend that, although there are hundreds of samples of rice produced in the Calcutta market by blending, still, for the purposes of this trade, quite a small range of samples would be satisfactory to both buyer and seller, and we would like to see a standard range of samples which could be depended upon. We have also called for official weights, which are not obtainable at the present time.

3450. What do you mean by official weights?—The rice is imported and sold by the bag, the bag is one of two maunds, that is an Indian measure. We call for a bag of rice to weigh 164 lbs. landed here, but it is quite the exception to get rice up to that standard.

3451. What reply have you had from Bengal on this subject?—They have declined to give the official weights. We have tried to arrange to get them through the shipping companies and we have even offered to pay a higher rate of freight in order that the official weight might be given by the shippers, but we have not been successful in that respect. The principal difficulty is owing to the fact that the rice comes down the river in "godowns" and these lie in the river for some time waiting for a steamer to arrive, and during all this time those on board the "godowns" live on the rice.

3452. It is not a question of rice drying then, it is a question of pilfering?—Yes.

3453. Have the other importers of rice from India joined with you in making representations?—Yes.

3454. I do not mean the other importers here but the importers in other countries?—Natal is practically the only Province in the Union which imports rice, that is ration rice. The white rice known in the trade does not come from Calcutta at all, it comes from Rangoon.

3455. To what other ports is ration rice shipped from Calcutta?—The East Coast of Africa and West Indies very largely.

3456. Have the importers there joined with you in representations?—The same difficulty in regard to weights has arisen in their markets.

3457. My suggestion is, has any joint action been taken by those who have suffered from these practices in other countries?—I do not think so. In the case of Natal we have approached Hankow and Melbourne to co-operate with us in regard to the complaint and in the appeals which we have made to the Calcutta Chamber of Commerce, but they have not seen their way to go further with it.

3458. For what reason?—It is not much use, especially in regard to the Jute Growers' Association; they have a monopoly. We are all bound to go to Calcutta for our jute, but they are not open to criticism.

3459. Because probable representations made by the whole body of buyers would have greater force than representations made by a small section?—We have done that from South Africa by bringing the matter from Durban to the notice of the Associated Chambers of Commerce, and at Kimberly last year it was arranged that the Executive Committee of the Associated Chambers should appeal to the Calcutta Chamber of Commerce.

3460. Have they done so?—Yes, we submitted a form of contract note which we thought would be reasonable and acceptable to both parties.

3461. **(Mr. Tatlow.)** You say that disputes that arise in regard to exports from South Africa especially, are generally settled at the receiving ports without difficulty by arbitration, but I suppose numerous cases do happen where it is not so?—I do not think many cases arise. At the present time the exports from South Africa that would be subject to dispute are principally maize and wattle bark, which is shipped principally to Hamburg, and the practice there is to appoint arbitrators and the shippers have so far agreed to abide by it.

3462. But your point is rather that the arbitration should take place at the receiving ports, because that is the most convenient place, and in regard to the two commodities of which you speak, grading does not apply?—Yes, it would apply in the case of maize, but not bark. There is a movement now to appoint Government graders for wattle bark.

3463. **(Mr. Sinclair.)** The objection which you put forward to the system of arbitration is one that calls for adjustment, does it not, between the respective Chambers of Commerce that are in existence?—Yes.

3464. You have set aside, have you not, and decided not to resort to, your ordinary common law rights; is that so?—So far.

3465. You forgo your common law riglits and frame by agreement regulations to govern the settlement of disputes?—Yes.

3466. And those regulations are, from your point of view, defective?—Yes.

3467. If you fail by negotiation to get what you regard as an equitable modification of your regulations you can always fall back on your rights?—Yes; but legal proceedings between dealers separated by the ocean are very expensive and very troublesome.

3468. Yes, and very unsatisfactory, no doubt. But it is a lever, is it not, that would help you to get an adjustment of an unsatisfactory and unfair regulation?—Yes, it is a final expedient, but we wish to promote more amicable terms of dealing.

3469. And, so far, you have failed to get the regulations adjusted in the way you think fair?—Yes.

3470. Are you still negotiating?—Yes, we have not heard officially from the Calcutta Chamber in regard to the correspondence with the Executive of the Associated Chambers of Commerce of South Africa.

3471. **(Mr. Lorimer.)** I notice in this memorandum that the principal difficulty you have is with India?—Yes.

3472. What you want to arbitrate on is whether the article delivered is exactly as ordered and paid for?—Yes.

3473. How do you prove your case?—The vendors have representatives here who take the orders from us.

3474. What I want to know is, what does your proof consist of?—Showing the representatives of the vendors the goods complained of.

3475. Can you at any time produce the article agreed upon and say "That is what I bought and that is what you supplied"?—In the case of grain bags, the custom here is to buy 2½ lb. grain bags known as A Twills, which should weigh 2½ lbs. When we find those bags arriving here weighing 1¾ lbs. and 2 lbs. and 2¼ lbs. we say we have a right to complain and we call the representatives of the vendors in and they report to their principals.

3476. What answer do they give?—They say the class of goods we buy is so low in quality that it is impossible to make every bag weigh exactly 2½ lbs.

3477. But would you be expected to submit to a variation of 40 per cent. Is it a big thing?—Yes, a very big thing.

3478. These arbitrations will be costly?—Yes.

3479. Could you not have two bags agreed upon and accepted, one held by each party?—It is not customary to submit a standard sample.

3480. But would not this be the better way of dealing with the matter; would it not tend to obviate disputes?—It might, but I do not think you would get the Jute Growers' Association to submit a standard sample.

3481. If you had a standard sample that would determine the weight you were to get. Would they agree to that?—The definition 2½ lb. A Twills 8 by 8 porter ought to give a satisfactory result.

3482. Well, it seems to me to be possibly a satisfactory way of settling what appears to be a very extensive ground of dispute and one that causes a great deal of expense, irritation, and annoyance. It seems to me that if each of you agreed to a sample, if it did not prevent disputes it would facilitate settlement?—Yes; but if you have an article produced of a given fabric, and you arrange for the number of counts of that fabric and the weight you would not be able to go past that definition.

3483. **(Mr. Campbell.)** With regard to arbitration, Mr. Butcher, is there any legislation in the Union which allows parties to submit their differences to a tribunal, and in the submission to that tribunal to agree to forgo their rights before the court?—**(Mr. Butcher.)** No, I do not think there is any provision for arbitration.

3484. You have not got anything here in South Africa corresponding to the Arbitration Act in England?—No, I do not think so.

3485. Would it not be advisable for you to press for legislation of that kind in order to strengthen the awards of your arbitration tribunals and the Chambers of Commerce?—Of course, legislation here would not bind the parties in India.

3486. But I am speaking about your own arbitration tribunals here—about the strengthening of your arbitration tribunals in connection with the Chambers of Commerce. Let me explain; the matter of arbitration awards that is before the different Governments now is a question of extending the awards of commercial arbitration tribunals from one country to another by some means of registration or something equivalent to it?—That is to say, the findings in one country must be binding in another country.

3487. Yes, if extended by registration; by transference of the judgment. And what I was suggesting was, that until you have your arbitration tribunals here properly strengthened by an Arbitration Act, it would be rather too much to ask that the awards of your tribunals should be extended to other countries and binding on contractors in other countries?—Quite so. But we want to try and arrange for a system of arbitration which shall be mutually agreed upon by buyers and sellers in the different countries. The conditions are so different in the different Dominions that special arrangements would have to be made in almost every market. For instance, here we would be told by the Jute Growers' Association that South Africa is a very small market comparatively—that we in Durban, for instance, are a very small community, and we could hardly look for an unbiassed finding.

3488. But still, if you had an arbitration tribunal in South Africa which was recognised by law here, and you could go before that tribunal and get judgment which could be extended to Calcutta or any part of the Empire, it would help you in the direction you wish?—You must have technical knowledge of the matters in many cases where you arbitrate on the matter of quality.

3489. Is not every Chamber of Commerce in South Africa provided with technical knowledge by arbitrators and assessors? Have you no means here in your Chambers of Commerce for the formation of an arbitration tribunal which would have that expert knowledge in every case?—Yes, we have.

3490. What I want to know is, is that arbitration tribunal backed by an Arbitration Act so that the judgments of the arbitration tribunal are equivalent to a court of law if registered?—No, not as between parties resident in South Africa and parties resident oversea.

3491. Do you not think that legislation of that sort would be a considerable gain in this country?—**(Mr. Buchanan.)** Yes.

3492. And having got that, it would assist in the movement to extend the judgments of such courts to other countries with which you have disputes?—Yes, I think so.

3493. With regard to these rice contracts, the system of buying, I understand, is for the rice merchants in India to have representatives here and they submit samples to you and you buy on those samples?—**(Mr. Butcher.)** Yes.

3494. Are those the manufacturers' own samples or does the Chamber of Commerce in India fix standard samples?—There are no standards fixed—that is just what we want.

3495. You want standards fixed by the Chambers of Commerce in India?—Yes.

3496. In the making of these contracts, you have given the Commission a specimen sale note, which this Chamber of Commerce has submitted, I understand, to the Chambers of Commerce in India for adoption by the merchants?—We have submitted a sale note which the Executive of the Association of Chambers of Commerce in South Africa has submitted to the Chambers in India, so that the negotiations would have more weight, as coming from a combined body.

3497. With the ultimate idea of that note being adopted by the Chambers of Commerce in India?—Yes.

3498. In the making of these contracts for the sale of rice and jute goods, is the rice usually delivered by the vender in Durban, or is it delivered on board the ship?—It is delivered free on board, and usually sold c.i.f., delivered on to the wharf here.

3499. The vendor's contract does not terminate in India?—The vendor's contract terminates with the discharge here.

3500. I noticed you made a provision that the arbitration action should be brought here?—Yes.

3501. **(Sir Jan Langerman.)** You would not like to commit yourself to a definite statement that there is no Arbitration Act in South Africa?—I am not aware of any Union Arbitration Act.

3502. We have such an Act?—It has not come to our notice.

[*See also letter from Mr. Butcher, printed as Appendix II., p.* 176.]

Durban, Tuesday, 24th March, 1914.

Mr. E. Anderson (Chairman) and Mr. Joseph St. G. Reynolds-Tait (Secretary) of the Natal Manufacturers' Association.

(*For the evidence of Mr. Reynolds-Tait on the Tea Industry, see p.* 222 *of* [Cd. 7706].)

3503. **(Chairman.)** You represent the Natal Manufacturers' Association?—**(Mr. Anderson.)** Yes, I am Chairman and Mr. Tait is Secretary.

The witnesses submitted the following Memorandum:—

The growth of Durban as a manufacturing centre during the past ten or fifteen years has been greater than that of any other South African centre, and it may be of interest to record shortly the reasons which have induced manufacturers in Europe to consider the potentialities of Durban as an industrial centre; first in relation to South Africa as a whole, and secondly, in relation to the Southern Hemisphere.

The economic conditions of South Africa fifteen years ago were vastly different from what they are to-day. At that time South Africa was more or less a mining camp, which imported the finished products of other countries, and paid for them in raw gold and diamonds, and, to a limited extent, in ostrich feathers and wool. A little later, the possibilities of a market whose consumption of products ran into millions sterling every year began to attract the attention of a few who had the necessary knowledge, the necessary capital, and the necessary enterprise, and small industries arose one by one, which struggled against the opposition of importers, the indifference of the public, and the neglect of Governments to their efforts to secure a few of the crumbs which fell from the rich tables of the Rand. Some of these industries, by dint of heroic efforts, secured some recognition from their respective Governments in the shape of protection by means of Customs duties, and the European manufacturer began to find his business attacked by the competition of the local producer.

There can be no doubt that this has been the first factor in promoting inquiry into the possibility of opening factories on the spot to recover the trade that has been lost. The same course was adopted when the United States, Germany, and Australia imposed a protective tariff.

But this was not the sole consideration. Large as the South African market is, the life of the Rand is limited, and although new goldfields may be and are being discovered, the European industrialist requires something more stable than a speculative possibility of this kind before he can be induced to sink capital in, and import works for, the securing a market which might in the end prove worthless.

That more stable factor can readily be seen by glancing at the map of the world, and considering South Africa's position in the Southern Hemisphere. The problem before the European manufacturer, put into a few words, is, therefore, "How can I secure the trade of South Africa, which at present shuts out my goods by a protective tariff?" and the answer, "By opening a factory there," induces the further question, "Where can I find a wider market for my surplus products if the South African market should not suffice?" The answer is "Overseas."

South Africa having been decided upon for these reasons, the next problem is, in what part of the sub-continent? To be a manufacturing centre, a town requires a healthy climate, plenty of fairly level ground, an adequate water supply, a good and cheap coal supply, cheap labour, and proximity, or at least access, to a harbour capable of allowing deep-draught vessels to load and unload. (In this connection it is noteworthy that Port Natal is the only harbour in the Southern Hemisphere which has a depth to accommodate vessels of the size of the "Mauretania" and "Lusitania.") At the same time it must be near to the market it intends to feed. Cape Town possesses one great advantage in that, on the Atlantic side, water can be obtained at a temperature which never exceeds 42 degrees all the year round, thus obviating the necessity for refrigeration. It also has plenty of room for expansion, and a good harbour, but there its advantages end. In regard to quantity of water, prices of coal and labour, and nearness to market, it is out of the running. The other Cape ports do not possess even the advantages of Cape Town, and even if Lourenço Marques were in the Customs Union, its handicap of climate and administration would more than counterbalance its advantages of coal, water, and geographical position. Durban is the only town which fulfils all these conditions, and it is thus to Durban that the European industrialist looks when fixing the scene of his operations. In addition to its nearness to the great market of the Rand, it is exactly halfway between Cardiff and Hong Kong, and practically half-way between London and Melbourne. The whole of Southern Asia lies at its front door, and the east coast of South America is only round the corner. It is too early yet to say whether the huge deposits of iron ore near Maritzburg and in the Northern Counties are really payable propositions, and whether the product of the lime deposits of the Umzimkulu can be laid down at a figure to enable that iron to be smelted; but should this basic industry be successful, it requires no great stretch of imagination to see Durban the Liverpool not only of South Africa, but of the Southern Hemisphere, before the present century has half run its course.

3504. We shall be glad if you will give us a few more facts in support of your general thesis.—**(Mr. Anderson.)** If you will ask questions we will be pleased to answer them to the best of our ability.

3505. First of all, in regard to the growth of Durban during the last fifteen years. You say that it has been greater than that of any other South African centre. Have you any figures in support of that statement?—**(Mr. Reynolds-Tait.)** The rateable value of Durban has increased very considerably, as the Corporation figures will show. Those figures can be easily obtained.

3506. Have a number of new industries been started here?—**(Mr. Anderson.)** Yes. I may tell you that we were asked at the eleventh hour to prepare this statement, and, although it is quite correct it has been written rather hurriedly and there has not been time to supply any detailed information. But everything that is stated there can be substantiated, and if there is anything that we are not able to reply to now, we shall be quite willing to come back and give further evidence or let you have any data that you may wish.

3507. Your general thesis is this, that with a view to the creation of a big industrial centre at Durban, the capitalist requires some guarantee of permanence greater than the Rand can afford?—That is so.

3508. And therefore it is important and even necessary to create other markets than Johannesburg?—Yes.

3509. What have you to say about other markets that you think it may be possible to create?—Along the whole of the South Asiatic coast there should be a market for goods manufactured locally in competition with Great Britain considering that we are the half-way house between Great Britain and that market.

3510. Of course, one of the governing conditions in regard to a trade of that kind being created is cheapness of freights from this country?—Undoubtedly.

3511. And to obtain cheap rates from here you have to create cargo coming here?—Yes.

3512. What possibility do you see of that. You must lay out the entire route of the steamer if you want a cheap rate. For instance, we had the same

story yesterday about coal.* They said there is a large market in India and the Far East provided we can get a cheap freight, and then the question arises what return cargo you could get?—**(Mr. Reynolds-Tait.)** But is it necessary that the vessel should come here from India? A large number of vessels come here in ballast with Baltic timber.

3513. Is there a large number?—A large number of vessels. The Clan Line of steamers come here from Liverpool and proceed East or to Australia for the purpose of picking up homeward freight.

3514. And your suggestion is that those vessels could take on Natal manufactures?—Yes.

3515. But have you in your mind any new trade which would give vessels plying between the East and here any cargo in this direction?—**(Mr. Anderson.)** From the East rice is being imported and goods emanating from China—gunnies and rice. Many vessels are plying between India and South Africa.

3516. You say that the whole of Southern Asia lies at your front door and the coast of South America is only round the corner. How far is the East Coast of South America from here?—**(Mr. Reynolds-Tait.)** I should say between 5,000 and 6,000 miles.

3517. Do you see any possibility of getting cheap freights from here to South America?—**(Mr. Anderson.)** There was a time when the steamers came from South America fully laden with frozen meat, maize, and grain. Of course, everything must have a beginning. I should like to give an illustration in regard to my own particular industry, namely soap. A soap manufacturer, wherever he may be situated in the world, gets a lot of raw materials from Australia and from the East. Now the vessels come here from Australia with cargoes of tallow; they come into this port and land some of their passengers and take others, and they also take coals and proceed home to England with this tallow. This tallow is manufactured into soap and sent back from the United Kingdom to South Africa. This would not be possible if the freight for this tallow was not actually lower from Australia to the United Kingdom than it is from Australia to South Africa.

3518. Is that so?—Yes, it is.

3519. Can you give figures in support of that?—Yes, I can give you figures. The freight rate from Australia to London is about 40*s.* to 45*s.* I am now speaking of tallow. The freight rate from Sydney or Melbourne to this port is 47*s.* 6*d.* Of course, the owners of these vessels are in London. They must study the man living in the United Kingdom, and the man in South Africa is left very much to himself. The management of the shipping lines on this side of the water do not see their way to help in these matters.

3520. What causes you to attribute that particular motive to the action of the shipowners?—I may perhaps be a bit blunt or drastic, but that is the fact.

3521. But have you any reason to suppose that this is their motive?—We have complained against the freight, and we have not got any reduction. I have a bill of lading here—one for 1910, when the freight was 30*s.* A bill of lading came in this morning from Sydney, and the freight was 47*s.* 6*d.*; the actual difference, therefore, is 17*s.* 6*d.* per ton.

3522. On what line of steamers?—The P. & O. branch Australian service, and the first one happened to be the same thing, Lund's Blue Anchor Line, which is now incorporated in the P. & O.

3523. Do you get the same rates from all lines?—Yes, the freights are fixed every Monday morning. The tendency of freights year after year has been upward. The first was 30*s.*, the next 32*s.* 6*d.*, the next 35*s.*, the next 37*s.* 6*d.*, the next 42*s.* 6*d.*, and the last 47*s.* 6*d.*

3524. Will you give the rates of each?—Yes. On the 15th February, 1910, which is four years ago, the freight was 30*s.* On the 13th March, 1909, it was 32*s.* 6*d.* On the 14th February, 1910, it was 35*s.* On the 21st April it was 37*s.* 6*d.* On the 15th March, 1911, it was 42*s.* 6*d.* On the 20th February, 1914, it was 47*s.* 6*d.* This is not only the position with tallow, but it is also the position with flour and everything else from Australia. The man in the United Kingdom has the benefit; he pays the same rate of freight that we have to pay, although the distance is more than double.

3525. In regard to ships bringing tallow or any other cargo to this country, would they be able to secure paying cargo from here to the United Kingdom?—Yes, I think they would if they were allowed to by the combine which exists in the trade, so far as South Africa is concerned.

3526. What combine do you mean?—I mean the Shipping Conference. It will not allow these outside people to take cargo. And then there is another element in the question, and that is the floating capacity of the Indian Ocean, which is known to be ever so much greater than that of the Atlantic Ocean. The water in the Indian Ocean has a higher floating capacity than the Atlantic Ocean, because of the higher percentage of salt, and very likely after a ship from Australia came here and took 100 tons of cargo from Durban she would not be able to go home with that cargo because she would be over the Board of Trade Plimsoll mark.

3527. That ought to give you cheap freights from Australia to South Africa?—We ought not to have to pay the same rate of freight as the man in London for less than half the distance. I believe the distance is 4,000 odd miles as against 10,000 odd miles to the United Kingdom.

3528. When you put that before the shipping company, what did they say?—They said it would be referred to London, and we have heard no more.

3529. What cargo do you suggest that these ships could take from here to London?—Wattle bark, maize, and all the ordinary lines that are shipped from this port.

3530. What are the rates on those lines from here to London now?—I cannot tell you.

3531. Your suggestion is that they could bring goods here at a lower rate and complete the price by taking goods on to London?—Yes. The present position is very much against us.

3532. **(Sir Jan Langerman.)** How would rates in South African and other ports compare with Australia and Canada? Are they higher, or the same, or lower according to distance? We will say from England to South Africa, and from England to Australia and Canada?—I cannot give you any facts of my own knowledge, but I believe the freights to Australia are slightly lower than from England to Australia; I am not certain.

3533. You know the freights are higher to South Africa because the shippers say they have no return freight?—**(Mr. Reynolds-Tait.)** Well, we manage to export nearly 1,000,000 tons a year more than we import at the present time.

3534. How is it, then, that the ships that come here have to go to the East for a cargo?—Because all the export trade practically is carried on through the combine lines.

3535. Have all those ships that come here sufficient return cargo?—Yes, they can carry more out than they can bring in.

3536. If you wish to create industries for exporting goods you will have to create a larger import trade?—Yes.

3537. In order to get reasonable rates?—Yes.

3538. Because a ship would not come here specially to load up?—No.

3539. Generally speaking, you are in favour of protection in this country, I understand, in order to protect industries?—**(Mr. Anderson.)** Yes.

3540. **(Sir Alfred Bateman.)** Did you say just now that the tonnage shipped from here was 1,000,000 tons more than is imported?—**(Mr. Reynolds-Tait.)** Yes.

3541. I cannot see how that can be. I have the table prepared by the Chamber of Commerce for 1912 showing 1,500,000 tons shipped and 2,700,000 landed?—**(Mr. Reynolds-Tait.)** We have the Customs Year Book for 1913 which was issued the other day and it shows a big difference.

* See evidence of Mr. J. T. Williams and Mr. Otto Siedle pp. 125 and 130 of [Cd. 7706].

3542. Surely it cannot have gone all that way in a single year. For 1911 it was 1,100,000 tons shipped and 2,400,000 tons landed?—I include bunker coal.

3543. Coal for bunkering is not included?—Well, I include it.

3544. It is not generally treated as cargo?—I treated it as export.*

3545. Another point I think is this. You said you thought you were badly treated as regards freight on goods that come from Australia to this country. You were charged a high rate of freight and you were also charged a high rate on goods going to England? **(Mr. Anderson.)** No, I mean from England.

3546. I think you spoke of your exports also?—**(Mr. Reynolds-Tait.)** No, I believe the export rates are fairly reasonable.

3547. You now pay $\frac{3}{8}$ of 1*d.* on wool as against $\frac{1}{4}d.$ from Australia to England?—Yes.

3548. And that is on account of your wool not being baled as closely as Australia's?—Yes, I believe so, although our wool is pressed in hydraulic presses very closely.

3549. Now, coming to the prospects of manufactures. Do you not think that the extension of manufacturing, as you desire, will begin by your making up the raw material you prodnce here. For instance, I see a proposal to form a wattle extract export instead of exporting the wattle bark?—Yes.

3550. And you represent the soap industry?—**(Mr. Anderson.)** Yes.

3551. That is composed very largely of raw materials that can he produced here?—Yes.

3552. You want a supply of tallow?—Yes, or other vegetable oils.

3553. Something you can produce here?—Yes, that has already been done. The soap industry has been in existence in South Africa about fourteen or fifteen years, but through the many cattle pests we have had in this country, the quantity of tallow has never been sufficient to enable us to get it from South Africa. It has been less and less every year on account of these pests. Some time ago, as you are aware no doubt, the whaling industry was established here and whale oil has been exported to England, but through tho presence of the soap industry in this country and new discoveries matters have gone so far that this whale oil will very likely no longer be exported to England. It will be used out here in the soap industry and in the form of edible fat. That illustrates to you how one thing leads to another. In regard to the exportation of wattle bark, ten years ago the export was very small and it would never have paid anybody to have established a wattle extract factory here, but now, on account of the freight being so high and the large amonnt of waste which is being sent home, it is found to be a payahle proposition to establish an extract factory. All the wood is not sent home because the bark only contains about 35 per cent. of acid, and a movement is now on foot to extract the tanning acid locally; they will then only send the tanning acid home and retain the wood matter here.

3554. But you are inclined to agree that for some time to come the kind of industries that you must have are those indnstries in regard to which the raw material is very bulky, such as the soap and wattle industry. Is there any chanco for leather?—Yes, I think so, certainly, but, of course, the leather production is also bound np with the question of cattle.

3555. You want more stock on the land both for soap and leather?—Yes.

3556. But you do not expect that within a very reasonable time you will compete in the East with Manchester?—No. **(Mr. Reynolds-Tait.)** As regards cotton, never.

3557. And in the highly developed industries?—No, we cannot spin cotton here.

3558. Nor in regard to wool. Do you spin tops here?—No.

3559. Then coming to what you consume here. You will be able to find your own sugar?—Yes.

3560. But then, again, the prices at which you work are higher, are they not, than in most countries? The price of sugar here is about 3*d.* as compared with 2*d.* in England?—Yes, but you speak of retail prices. It would be better to take the wholesale prices. The wholesale price is about 17*s.* 6*d.* for 100 lbs. best refined sugar.

3561. As compared with about 12*s.* in England?—**(Mr. Anderson.)** No, I think the best German granulated sugar costs something like 14*s.* 9*d.* to 15*s.*

3562. There is only a difference of 2*s.* or 3*s.*?—Yes.

3563. But in all these things the market that you work for now is the population you have here?—Yes, but we are speaking very much of the future in regard to the articles put before you.

3564. Now as regards your power, is there any chance of your making much use of electricity or electric power?—Yes.

3565. There is no water power?—No, but the coal is fairly cheap.

3566. Would the small coal at the pits be of any use to you?—Yes. From the comparisons I havo made I think the electric power or current supply in Durhan is as cheap or cheaper than anywhere else in the world practically. A short time ago we wanted to go in for a certain industry and we were quoted a rate of 0·4 of a penny per unit. That is a very low rate indeed. We were bound to take several millions of units per annnm, and we had to undertake to use the current at snch times as there was not much demand; otherwise the figures were as I have stated. **(Mr. Reynolds-Tait.)** The rate in Birmingham is 0·57 and in Blackpool it runs from $1\frac{1}{2}d.$ to 0·45 of a penny.

3567. So it is in those two directions that you contemplate an extension of your manufactures in time?—Yes.

3568. **(Mr. Sinclair.)** How long did you tell us your own industry had been established, that of soap-making?—We ourselves have been here sixteen years, but altogether the soap industry has been in South Africa a matter of twenty-five years.

3569. Has it been during the whole or a part of that time dependent on the import of tallow from Australia?—I should say always, and if you will allow me to say so the same thing is the position on the Continent and in Great Britain.

3570. And it is becoming increasingly dependent on shipments of tallow from Australia?—No.

3571. That means, then, that you are increasingly producing the tallow you require for your own manufactures?—Yes, and fats or vegetable oils, whatever may be used for soap-making.

3572. What is the prejudicial effect that you suggest to your industry by reason of the additional freights?—The prejudicial effect is that up to several years ago, when the industry was first met by a protective tariff and the lowering of the railway rate by the Government, it was impossible to compete with the oversea manufacturer because of these advantages which he had in regard to freight.

3573. Your industry has the natural protection of the freight on the manufactured article to the Union, has it not?—No, it is the reverse.

3574. You spoke of the raw material coming into the mother country and being sent back here in the shape of the manufactured article?—Yes.

* *The witness subsequently supplied the following Memorandum:—*

TONNAGE OF CARGO LANDED AND SHIPPED AT PORT NATAL AND THE UNION FOR THE YEAR 1913.

	Tons.
Natal:—	
Landed	865,699
†Shipped	2,290,004
Surplus	1,424,305
Union of South Africa:—	
Landed	2,775,957
†Shipped	2,948,496
Surplus	172,539

† Includes bunker Coal—1,080,000 tons in 1913.

3575. Do you not get the protection of the freight on the manufactured article from the mother country to South Africa?—No, it is the reverse.

3576. Manufacturers who send their goods from the mother country to South Africa to compete with yours have to pay freight from England to South Africa on their soap?—Yes.

3577. That is my point.—Yes, but may I extend it a little. We get a certain amount of raw materials from the United Kingdom, for instance, some kinds of oils. We have to get oils also from the Far East. Now on our raw materials the freights are higher than the freight on manufactured soap, in some cases three times as high, and therefore we have to pay a higher freight on the raw materials and on the small lines and accessories which we have to import for our business; so we are handicapped in that respect.

3578. Would you expect to get the same freight rates on the comparatively small quantities of tallow that would be shipped here as compared with the larger quantities that go to London?—Yes. In the bottom we can take the same quantities as they take in London.

3579. Is that regularly throughout the year?—Yes, all the year round.

3580. Have you made a calculation of the quantity that you would be able to take?—In regard to soap, I would like to mention that it is really not my desire to ventilate any grievance because after all we have overcome the conditions. I should like it to be understood that it is not a grievance with me. I am only using that by way of illustration. I am not here to air grievances. I am only here to give information to the Commission.

3581. **(Mr. Lorimer.)** What are the industries which you have contrived to establish in South Africa in spite of the neglect of the Government and the indifference of the public which you refer to?—There are many—tea and sugar, soap, candles, and in fact practically all the small industries are here.

3582. What do you manufacture besides?—Various food-stuffs, confectionery, cereals.

3583. Do they all pay?—Some do and some do not.

3584. You are struggling against the natural conditions and not very successfully?—Well, I would not put it as bluntly as that. We are struggling against industries that have been established more than 100 years, and which have the whole world as their market.

3585. You have, of course, certain things which you can utilize to a very good purpose, such as sugar and tea, but when you come to established manufactures in competition with the whole world, of course, you recognise that you have to look for a market outside of South Africa. You recognise that your market here is very limited?—Yes.

3586. And if you are to make these industries more successful you must look to the Eastern countries and to South America?—Yes.

3587. When we were in Australia and New Zealand that is precisely what we were told—they have similar industries to yours. Have you considered whether you have any advantage over those countries?—No. I am afraid we have not considered that point, but, of course, these ideas are not for the near future, they may come in ten, fifteen, or twenty years, but we keep the objects before us.

3588. Of course, in international competition success depends altogether on the cost of the working, and the cost of the work depends on the price of raw materials and wages?—Yes.

3589. In regard to raw materials for any industry which you could establish, how are you situated as compared with Australia and New Zealand?—I think we are as favourably situated as they are.

3590. Then, in respect to wages, you ought in one sense to be situated much more favourably because of your cheap coloured labour, a large amount of which would necessarily be introduced into your manufactures. Can you tell me, so far as you have gone, if you have found it really cheap?—No.

3591. Is it dear?—Yes.

3592. Unless you can make that labour more productive you have no advantage over Australia or New Zealand?—No, not that I know of, only our geographical position, perhaps.

3593. You can always retain your own market by means of protective duties for anything that you can consume, but you recognise that it would not pay to establish industries which depended solely on your own market. You must look outside?—We began with our own country, and there is no doubt it must be recognised that the native is becoming a larger consumer from day to day.

3594. Would you have your Kaffir always in your own market?—Yes.

3595. But even with the growing consumption of the Kaffir, do you think you could establish industries that would be profitable unless you go outside?—Yes, I think so.

3596. I can appreciate the natural desire on the part of the South Africans to retain their market, but I think from what you have stated in this memorandum you recognise also that the demands of your own market would hardly justify the establishment of extensive manufactures, and I was trying to find out what you knew of the relative costs of production here and in other markets of the Empire where you are likely to find competition. So I pointed out to you that the cost of your work would depend entirely on the cost of raw materials and wages. You think that raw materials are just as cheap as in other parts of the world, and you think your coloured labour is cheap?—Yes.

3597. And you think, very properly, of the iron industry as being a basic industry. You do not know very much about the position of South Africa in respect of iron ore?—No.

3598–9. I have had various papers before me relative to this subject, and one particularly in Natal, but it is so little developed and so little known that I would not care to pronounce upon it. But I can see, nevertheless, that it is not an ore of the highest quality. There are ores, as far as I have made out, of very high quality in different parts of South Africa, but not in Natal. I have read your paper with sympathy, and I would like to see you develop on the lines indicated. But you recognise, and it is our duty to point out to you, that the conditions in many respects are not very favourable, and that the wages for white labour are the highest in the world?—Yes, for the time being, but they will be reduced as time goes on.

3600–1. Of course, as long as there is a demand for labour on the Rand at high wages you are not likely to get industrial work done on a much lower basis?—No.

3602. **(Sir Jan Langerman.)** In connection with the establishment of industries and the power required, could you make use of the Howick Falls?—I may say that for a certain industry, which we had in view, we were thinking of using power from the Falls, but then, again, these Falls are so far from the coast, and the raw materials would have to be carried there, and you know that some of the South African Rivers have an unfortunate habit of drying up now and again.

3603. Supposing you were to establish the industries here in Durban, would the loss in transmission be too great to bring the power down to the coast economically?—I am really not an authority on that subject, but I believe the Corporation of Durban would never allow the current from the Howick Falls to come here and compete with their own power.

3604. They cannot stand in the way of the establishment of valuable industries by their own selfish purposes?—That is really a subject I have not gone in for. **(Mr. Reynolds-Tait.)** We have the power at a very low price now. I do not think we could bring it from the Howick Falls at less than we get it now.

3605. You do not think you could obtain it any cheaper than at present?—**(Mr. Anderson.)** No. I may mention that from a waterfall in Norway, where power is obtained, 35 cubic feet of hydrogen costs about 1½*d.*, and the same 35 cubic feet produced from

the current we have here, at present prices, would cost a little over 2*d.*, so that, taking everything into consideration, it is very cheap.

3606. Therefore, the Falls would not be able to compete successfully against the coal, in view of the drawbacks you mention?—I am afraid not.

3607. You say that coloured labour is dear; what do you mean?—In regard to the Kaffir and the coolie.

3608. Supposing the Kaffir does a certain amount of work, and you were to eliminate him and put the white man in his place, would the Kaffir labour be dearer?—Yes, I think so. But I may also say that it is impossible to expect a white man in South Africa to do the work of the Kaffir to-day. It would be *infra dig.*: it would be beneath him.

3609. I want to know the value of the labour. Say the Kaffir would work for 2*s.*, and the white man would want 10*s.*, would the white man do five times as much work?—Yes, if he applied himself to it.

3610. In this climate?—Yes.

3611. You have wonderful white men in Natal, then.—I think he could do it.

Pietermaritzburg, Friday, 27th March, 1914.

Mr. P. H. Taylor, M.P.C., Mayor of Pietermaritzburg, and Mr. W. J. O'Brien, Councillor, called and examined.

3612. **(Sir Alfred Bateman.)** You have handed in a statement which I understand you desire to make to the Commission. We shall be glad if you will kindly read it and then we will ask you questions?—Before we proceed I should like in the name of the town to extend to the Commission officially a hearty welcome, and to say how pleased we are to have you amongst us. We hope you will have a pleasant time in Pietermaritzburg during your short stay, and that the evidence which you take here may prove useful to you.

3613. I am very much obliged to you for those wishes. I am sure we shall enjoy our visit very much.—I may say that since Pietermaritzburg became a disrated capital an endeavour has been made to encourage industries to establish themselves in this city. Of course, the Council being a changeable body, it is not in a position to lay down any hard and fast offers that might be made to manufacturers, but, as an indication of what the Council were prepared to do a year or two ago, the following offer was made for the establishment of an industry here—I think it was the wattle extract industry. An offer was made to supply water at the rate of 1*s.* 6*d.* per 1,000 gallons with a rebate of 6*d.* per 1,000 gallons on a guaranteed consumption. Electric power was offered at a fixed charge of 3*l.* per annum for the horse-power installed, current at 1½*d.* per unit with an alternate tariff of 3*d.* per unit for the first 25 units of horse-power of maximum demand, 2*d.* per unit for the next 100 units of horse-power of maximum demand, of 1½*d.* per unit for the next 100 units of horse-power of maximum demand, of 1¼*d.* for all current consumed over that amount. If preferred, however, the Council was prepared to supply current at a flat rate of 2*d.* per unit. There is every wish on the part of the Council to induce industries to establish themselves here, and though we are not in a position to make any definite offer as to the price of land I may say that we are always prepared to give any application the most favourable consideration. It is felt that Maritzburg, being the centre, to a very large extent, of the railway system of the Province, is very suitably situated for the purpose of establishing industries. I believe the Chamber of Commerce are going to give an indication of the industries that are already established here and some that are lying fallow. We thought it might be of use to anybody who takes up the question of establishing some of these industries that we have not yet got amongst us to know that the Council is prepared to give an application every reasonable consideration.

3614. Do you own a great deal of land in the city?—Yes, the town lands belonging to the municipality consist of about 27,000 acres, of which close upon 10,000 acres are alienated, and at present about 17,000 acres are unalienated.

3615. And this offer of electric power is a good deal less than the ordinary rate?—Yes, considerably.

3616. We are going to have before us the Chamber of Commerce on this question as well as others, and I am very pleased to have had from you an assurance of that kind. May I ask if any acceptance of that offer has been made to you or to your predecessors?—There have been several applications, but they have not come to anything, as a matter of fact, so far. One or two are under consideration, I think.

3617. Of course, we shall have to examine in detail the Chamber of Commerce, but we are pleased to have heard this from you?—Yes, it is our desire to give the greatest possible inducement to suitable industries to establish themselves in this town.

3618. **(Sir Rider Haggard.)** You said that 10,000 acres of your town lands have been alienated. Is that recently or of old?—It is since 1840.

3619. I suppose the trade of Maritzburg is generally agricultural, is it not?—Yes.

3620. Maritzburg depends for its prosperity upon the prosperity of agriculture in Natal?—Yes, on the prosperity of the farming industry.

3621. **(Mr. Garnett.)** Of the 10,000 acres that have been alienated, how are they being utilised at present?—Some are held as small farms and some have suburban residences built on them and various uses are made of them.

3622. What size of plot is being cut up?—They vary from 1 acre to 20 acres.

3623. On a plot of 20 acres what is the man doing?—Dairying.

3624. What would 20 acres carry?—The people on the town lands of Maritzburg have been in a rather fortunate position in this respect; although they may only own from 1 acre to 20 acres they have had the run of the rest of the town lands and recently the Council, in the last two or three years, has embarked on the wattle-growing scheme, which has had the effect of doing away with a great deal of grazing which these burgesses formerly enjoyed.

3625. Up till now they have had a sort of right to commonage on the town lands?—Yes.

3626. May I ask how long those offers in regard to the reduced water charges and reduced electric current charges have been made?—About two years.

3627. And in addition to those reductions in charges, did you give any other reductions? You must have other rates for the service of the town?—There is the ordinary general rate

3628. You have not made any reduction in regard to the ordinary general rate?—No, we are not in a position to do that.

3629. **(Mr. Sinclair.)** Is not Maritzburg one of the centres of activity of the wattle industry?—Yes, I think it is very well situated for that.

3630. Does an important part of the operations of dealing in wattle bark exist here. Are there firms here which deal largely in wattle bark and in the timber of the wattle?—There are firms dealing in wattle timber, but they are principally agents for Durban firms.

3631. Will they deal with the industry before the Commission? I gather that you are not going to speak about it yourself?—No, I did not come here with that idea. I believe the Chamber of Commerce will speak on the subject.

3632. **(Mr. Tatlow.)** In addition to the advantages that you have, and that you are able to offer to manufacturers in the shape of electric power and water supply, does Maritzburg stand pretty well in as regards coal supplies and the price of coal?—The coal mines are about 160 miles from here.

3633. Is there an abundant supply?—Yes, at about 10*s*. a ton for industrial purposes.

3634. Then it has the advantage also of comparatively cheap coal?—Yes.

3635. **(Mr. Bowring.)** How do you generate your electric power; by steam?—Yes.

3636. You have no water power?—No. I may state that the question of water power has been thought of. We have the Howick Falls at a distance of about 14 miles from the town and it has been discussed, but having already installed steam power we feel that we are not in a position to tackle the water question.

3637. It has been discussed, you say, and it is possible it may come into use later?—I would not like to say that. The difficulty about a scheme of that kind is this, that we cannot depend upon a full supply of water; the river runs very low during the winter season and it would mean conservation of the water at enormous expense.

3638. In regard to your electric plant, is that more than sufficient for your present requirements?—Yes, I think so. Councillor O'Brien can answer that question better than myself. **(Mr. O'Brien.)** I may mention that we have just installed a turbine and we have now sufficient power for all industrial purposes. We are supplying the railway with all the power they want for their workshops.

3639. And you can supply all that is required?—Yes, at any time.

3640. **(Mr. Lorimer.)** On the general question of industries, I should like to know what manufactures you have in your mind at the present time. When you talk of the facilities you have for establishing manufactures here, what have you in mind?—**(Mr. Taylor.)** Well, we think we are very well situated for the establishment of the wattle extract industry for one thing, a fruit canning industry for another. There are quantities of fruit produced round about this city and not far from it, and we think there is an opportunity for the establishment of fruit-canning and jam-making manufactories.

3641. How do you get your electric power now?—From steam.

3642. So that if you thought of taking advantage of the natural facilities for generating power by the waterfall which you have, you would have to reorganise your business on a completely new system?—Yes.

3643. How far would you have to bring the power from the water?—About 14 miles.

3644. Well, there would be very little leakage of the current in that distance. With respect to the industries that you have in your mind, would you have to import skilled labour?—I think we would. If we wanted any further skilled labour it would have to be imported.

3645. So that the position is simply this: You have the facilities for doing certain work, but all the necessary concomitants would have to be provided. You would have to import labour and you would have to create your power. You have your water running to waste, but you would have to establish an electric station and convey the power to Maritzburg or wherever you were going to use it?—But our own electric station at the present time is capable of a further output.

3646. You mean to say you can utilise the steam power you have just now?—Yes.

3647. If you propose to do that what advantage would you have over any other place with all your labour to import. I thought you were basing your representations on the fact that you have an ample water power here which could be used for industrial purposes; but if you have to use electricity generated by steam then you are in the same position as the other places round you in the country, except that you may be a little nearer to the coal than Durban is?—I suppose that is the case.

3648. All your skilled labour has to be found. You think you would have no difficulty in getting skilled labour here. You have, of course, plenty of natives, but are they the people who could be adapted to the conditions of industrial life?—Yes, by training. Of course, they could not do anything of a technical nature.

3649. Of course, we all desire to see the industrial development of the Union progress, but, naturally enough, if these industries are to be developed by outside help, if the English people are to establish factories here they would enquire where the most profitable conditions prevailed, and you would naturally represent the conditions of your own district. Consequently, we must ask these questions in order to satisfy ourselves as to whether you have the special conditions which you claim, and on what ground you put them forward. Now in respect to the industrial development of this Province, the great point is cheap power and cheap labour, at all events labour that would not be excessive as compared with other places. You would be at a disadvantage at first in not having any skilled labour here such as may be found in Durban or Cape Town. If the power which you have available was cheap enough, then, of course, that difficulty would be easily overcome. I suppose you have not the same large number of artisans, for example, as Cape Town or Durban?—No, but I take it those places have only got sufficient for the requirements of the town.

3650. Take mechanics' work, for instance. Have you a plentiful supply of mechanics—fitters and machinists of various kinds?—I should say they would come where the work lies.

3651. You are satisfied there would be no difficulty there?—There would be no more difficulty than in any other part of the Union.

3652. **(Sir Alfred Bateman.)** You think that the town of Maritzburg has many advantages and is in a very favourable position?—**(Mr. O'Brien.)** Yes, and the advantages could be enlarged and extended.

3653. **(Mr. Tatlow.)** Does the Railway Department do work to any extent here?—Yes, a large amount of repairs and renewals and rolling stock and locomotives.

3654. How many skilled men are connected with that work?—At present there are about 300 or 400, and we claim that the conditions under which the white man exists here are much more favourable than they are at the coast, where the climate is very semi-tropical.

3655. I suppose native labour is employed in the works as well as white?—Yes. The native is very adaptable, and in many instances he becomes pretty skilled, and that is a question you will have to face in the future.

3656. Of this 400 you speak of as employed by the Railways here, what proportion would be natives?—None of those are natives, they are all artisans. In addition to those they have a certain number of assistants who are probably natives— a few hundred.

Mr. David Forbes Forsyth, b.a., Chairman, and Mr. Robert Dunlop, Secretary, of the Pietermaritzburg Chamber of Commerce, called and examined.

(*For evidence of these witnesses on "Mining," see p. 26 of this vol., and on "Steamship, Post, and Telegraph Communications," see p. 80 of* [Cd. 7706].)

3657. **(Sir Alfred Bateman.)** You have prepared, on behalf of the Chamber of Commerce, a statement on the subject you desire to bring before the Commission. Will you please read it?—**(Mr. Forsyth.)** Yes. We represent the local Chamber of Commerce.

(*The statement was read, and is as follows. A portion of it, relating to iron ore, is printed on p.* 26.)

We represent the local Chamber of Commerce and desire to draw your attention to certain facts respecting this city and the establishment of industries.

Maritzburg is exceptionally favoured for the establishment of many industries, and the following reasons may be given in support of this statement:—

(1) Its geographical position—situated between the coal-fields and the port.
(2) Its healthy climate and surroundings, where an industrial population can live in comfort and in health.
(3) The great facilities it affords for obtaining native labour.
(4) Its excellent water supply, and the advantage of cheap fuel.
(4) Its position as a market centre for a very large farming community.
(6) Its position on the main rail-road to the Transvaal, Orange Free State, and the Northern Districts of the Cape Province, having branch lines to Griqualand East (soon it is hoped to be connected up with Fort Maclear), and to Umvoti County (thereby opening up a very large and important agricultural and wattle-growing district).

The following industries exist at the present time in the city:—

A large brewery; a biscuit factory; a large well-established wagon industry; gate and fence works; boot and legging factory; vinegar, sauce, and essence factory; clothing factory (bespoke); excellent printing establishments; brick-making and tile works; furniture factories, and railway workshops.

We desire to make the following observations, and will be glad to tender any evidence you may require with regard to the following industries.

Wagon-making.—This has been one of the principal local industries, this city being well situated for carrying out such work. It is a well-known fact that workers in wood and artisans employed in connection with iron work can do much more work in a given time in a comparatively cool centre like Maritzburg, than the same man can do in the same time at the coast. The wagon industry has maintained its activity notwithstanding the serious outbreak of East Coast Fever. The manufacturers have adapted themselves to the new conditions, and a different class of vehicle has been made for mules and donkeys in place of the heavier wagons that were worked with oxen. The local manufacturers send large quantities of their wagons as far north as Rhodesia. In our opinion there is scope for the establishment of an agricultural implement factory, which would make certain standard lines of ploughs and harrows which are almost exclusively imported. Such manufactures might be carried on in conjunction with the wagon shops.

Tanning and leather production.—This most important industry is only carried on in Maritzburg on a comparatively small scale. There is no question that materials exist here in unlimited quantities; both hides and bark are very largely exported, and a considerable portion of the shipments undoubtedly return as leather and leather goods, which might have been made locally, and thus saving double freight and intermediaries' expenses.

Woollen factories.—Extraordinary advantages and special facilities for the successful operation of a woollen industry exist here. There are ample supplies of the raw material obtainable. There is sufficient protection against the imported manufactured article, and there is a large market for all that can be made in the immense trade in native blankets. In addition to blankets a large trade could be done in hose, tweeds, and worsted jerseys. These are largely sold among natives.

Rhodesian cotton might be diverted to Natal and used in connection with this industry.

Fruit-canning, jam and preserve-making.—In a Province which has been named the "Garden Colony of South Africa," the fruit-canning and jam industry has not yet been developed, although it is well-known that large quantities of fruit are grown and allowed to rot.

Weights and measures.—This Chamber has passed resolutions from time to time in favour of the decimal system being applied to weights and measures.

Empire trade mark.—This Chamber is also in favour of the adoption of an Empire Trade Mark.

Beet sugar.—It is stated that sugar beet grows very well in this district, but owing to the cane industry on the coast, there is apparently no desire to give much encouragement.

Motor-car bodies.—Among the other industries we should like to see developed here is the manufacture of motor-car bodies, it being widely recognised that the carriage builders of this city, who are gradually being seriously affected, and their trade diminished, through the introduction of motor-cars, might be encouraged by Customs protection to embark upon the business of motor-car bodies.

Fire-clay.—Large bodies of valuable clay suitable for fire bricks and glazed and salt glazed bricks exist near this city. Fire bricks have been made for some years, and successfully competed with the imported article. Unfortunately this industry has closed down owing to lack of capital and technical knowledge.

Malt and hops.—Until recent years the whole of the main ingredients used in the manufacture of beer (malt and hops), have been imported from England. It has been realised for many years that if the very large quantities of barley and hops used in South Africa could be grown in this country, and the barley converted into malt, it would result in a very considerable stimulus to the agricultural industry. Imported seed barley of suitable quality for brewing purposes has been distributed in various parts of the country amongst the farming community at cost price, and the resulting crops purchased. This has necessitated the erection of maltings for the purpose of converting the barley into malt.

The malting industry is still in its infancy, and it is still necessary to import the larger proportion of grain used in brewing. It is believed that the soil in many parts of East Griqualand and the climatic conditions are suitable for the production of a good quality of barley. Considerable quantities of hop plants and seeds, with the aid of the Government Agricultural Department have been distributed amongst farmers, and it is hoped that the experiments in hop-growing which are now being tried by the farmers amongst whom the plants have been distributed, and at the Government Agricultural Experimental Farms in various parts of South Africa, will be successful, and result eventually in the importation of hops into this country being unnecessary.

We have endeavoured to give a brief résumé of the principal facts and features concerning local industries which we considered might be of interest or advantage to your Commission and hope that in due course they may bear some fruit, even if it should only result in giving greater publicity to the potentialities of this part of His Majesty's Dominions.

3658. **(Sir Alfred Bateman.)** You know that the paragraph referring to the subject of protection is entirely outside our reference, and we cannot consider it?—**(Mr. Dunlop.)** Yes.

3659. **(Mr. Sinclair.)** Among other industries that might be established here you mention the woollen

industry and you spoke of supplying native blankets. Where do those blankets come from now?—They are mostly English and Continental.

3660. Imported?—Yes. Some blankets, I believe, are being made down in the Eastern Province on a small scale. **(Mr. Forsyth.)** There was a small factory at Newcastle for making tweeds, but it had to close down. I think that the reason was that the quality of the stuff which they made was too good and did not seem to wear out soon enough, so that is the reason why we have suggested using Rhodesian cotton, which would make a shoddy material.

3661. Those who supply blankets in the meantime supply the quality that the native wants?—Yes.

3662. Can you tell us where the bulk of the present supply comes from; that is to say whether from the Continent or from the Mother Country?—I believe the bulk of the blankets come from the Continent, but it is quite an intricate business. Different parts of South Africa demand a different kind of blanket. The Basuto uses quite a different kind of blanket from the Pondo, and the Pondo quite a different one from the Zulu, and the trade has to cater for all these different wants.

3663. **(Mr. Lorimer.)** You say that a man can do better work in this fairly temperate climate than down at the coast, and if I may judge from my own experience, I quite agree with you at the outset. Now, in respect to these industries that are already established here: has this wagon-making industry anything to do with what we heard at another place in regard to the proposed contract with the Government for the railway wagons, which fell through?—No, it is a different thing.

3664. This factory is devoted to agricultural wagons, I suppose?—Yes.

3665. Does it prosper?—It has prospered in the past, it is a little bit dull at the present time.

3666. Is it the only one in the Province?—No, they make wagons in Durban as well. Every country town practically has a wagon maker's shop.

3667. Then you very naturally urge the desirability of establishing a manufactory for agricultural implements?—Yes.

3668. Now can you tell us what is the value of these implements imported into the country year by year. Have you the figures there?—I have the 1912 figures. In 1912 there was a value of 448,794*l.* imported into the South African Union.

3669. That is for the whole Union?—Yes.

3670. What would your share of that be, roughly. Would it be one-fifth or one-sixth?—I should think about one-fifth or one-sixth.

3671. Is there any duty on these things now?—No.

3672. Are you advocating the imposition of duties in order to establish it?—Yes, in the first instance to establish the industry.

3673. You will understand that we have nothing to do with that. When I was asking about the value of your imports, what was in my mind was this: is your business enough to establish a factory which would probably require, say, half a million of money expended on the plant, buildings, and so on, in order to enable it to turn out its work in the cheapest possible way?—We anticipate an enormous development in the agriculture of South Africa in the near future.

3674. You think of the future as well as of the present?—Yes.

3675. And your contention is that such a place could be built with satisfactory results in Maritzburg equal, at all events, to those in any other part of the Union?—Yes.

3676. The last witness mentioned the possibility of developing electric power from your waterfall?—The trouble, I am afraid, about our electric power from the waterfall is that in the winter time our South African rivers dry up to a very large extent.

3677. It would not be continuous?—I am afraid not.

3678. Would you have sufficient storage to keep you going?—That might be possible, but very expensive. I think we shall have to rely on our coal power entirely.

3679. Now, why is it there has been no attempt to utilise your hides and bark for tanning?—Well, we are a very small population in Natal, and, of course, it requires a considerable amount of money to establish an industry of this description, and investors are very chary of putting their money into Colonial industries.

3680. You just come there to the crucial point. I am sure we should all like to see your city and country develop its industries, but if they are to be developed on a profitable scale there must be a good market, and your population is small. What you want is population so as to increase the demand for industrial products?—Certainly.

3681. Now, in respect to what you said just now. Is there a lack of capital?—Yes.

3682. Do you find people here at all ready to invest money in industries?—No, they would rather invest it on first mortgage.

3683. Well, it would be rather difficult for us, would it not, to say that there was a big field for industrial development in Natal if the Natal people won't put their hands into their pockets and provide money?—I do not think they have it to provide.

3684. **(Sir Rider Haggard.)** Now, in your statement you talk about the jam and fruit industry, and you say there is every prospect of manufacturing preserves and so on; but it is not done on an adequate scale, is it?—No, there is a small industry.

3685. I think that complaint was made forty years ago?—**(Mr. Dunlop.)** Well, of course, I did not know about it then. We have had jam factories here, but they have closed down. I think the quality was inferior, judging as a layman. We make excellent home-made jam, but when it goes to the factory it does not seem to retain its flavour.

3686. You mention the matter of your population. What is the white population now in Natal?—**(Mr. Forsyth.)** About 100,000.

3687. What is the annual increase or the increase per cent.?—Last census there was a slight increase, but last census was taken in 1911, and the previous census was taken in 1904, when, in Natal, we had an inflated population owing to the disturbed conditions which had obtained during the period of the war.

3688. They would not have included soldiers in the census?—Not merely soldiers, but refugees and people who catered for the requirements of the soldiers. A fair comparison would be as between 1911 and 1891.

3689. **(Sir Alfred Bateman.)** They did include the soldiers, I think?—Yes, I think so, but they put a note about it

3690. **(Sir Rider Haggard.)** Surely they did not include the soldiers, that would double the population?—No, we did not have 100,000 soldiers in Natal, only a matter of 20,000.

3691. Would you say there has been an increase of 30,000 during the last twenty years—I should think so.

3692. Is that largely by immigration?—Yes, largely, but also very largely due to natural increase.

3693. Do you know what is your average number of immigrants arriving in Natal?—No, I cannot give you the figure.

3694. You have not got your white birth-rate, have you?—No, but I think it is somewhere about 35 per 1,000.

3695. **(Sir Alfred Bateman.)** As regards the blankets. You told us that most of the blankets came from the Continent?—**(Mr. Dunlop.)** I am not quite clear about that, but I should say, to the best of my knowledge, that the large quantity are Continental.

3696. Have you ever seen Sir Sothern Holland, His Majesty's Trade Commissioner for the Union?—Yes.

3697. Well, it is his business to look into these things where there are imports from the Continent, and I gathered generally from him that the Continental imports were not very large in blankets?—I am not prepared to say. I should say, in my

opinion, a great many cotton blankets are imported. We can see the country of origin in this year's imports.

3698. As regards the population of Maritzburg, you have a larger proportion of whites than in many places, I believe?—Yes.

3699. I see that you have about 15,000 Europeans in Maritzburg out of 31,500?—Yes, that is about half.

3700. That is a large proportion, is it not, for South Africa?—We think it is in comparison with other South African towns.

3701. I suppose you attach importance to that as showing that you are more of a white city?—Yes, and our local industries are endeavouring, as far as possible, to keep the trade in the hands of the white industrialists. **(Mr. Forsyth.)** In regard to the blanket question, I see from the returns published in the Blue Book in connection with blankets and rugs, that the bulk of these come from the United Kingdom. Out of a total import of 375,000*l*., there is 336,000*l*. from the United Kingdom.

3702. **(Mr. Garnett.)** In regard to the blankets that you mentioned as coming from Continental sources, would you be inclined to say that that particular class of blanket is the cheapest blanket that comes here, and such competition as there is is in the commonest kind of blanket?—Well, the native likes a good blanket so far as quality is concerned.

3703. But according to the evidence we have had put before us, it would seem to show that such competition as there is from the Continent is especially in the lowest priced class of blanket?—Yes.

3704. There is an importation from the Continent, but it does not appear to be very large. The evidence we have had is that this competition is in the very poorest of blankets. Are you in a position to say "Yes" or "No" to that?—No. We know there is a very cheap cotton blanket that is made on the Continent.

3705. Is that a manufacture of cotton and wool?—No.

3706. Because you said you thought that cotton from Rhodesia would be suitable for using in this blanket trade?—Yes.

3707. You had in your mind that this cotton could be used in these blankets or used for mixing?—Yes, the wool would make too good a blanket.

3708. And the trade in blankets you wished to establish is not a cotton blanket pure and simple which would compete with the lowest priced blanket, but a mixture of wool and cotton that would come in between the highest and lowest prices?—Yes.

3709. Well now, have you any knowledge as to whether the Rhodesian cotton would be useful for this purpose or not?—No, I have not.

3710. Now, in regard to hops: Have there been any experiments? **(Mr. Dunlop.)** A company is experimenting now. A certain amount of work has been done in connection with malted barley. A malting house was erected at Port Elizabeth, but it proved to be quite insufficient to handle the barley available. Another one was put up at Pretoria, but that has not been kept fully employed for want of sufficient barley.

3711. And does the same answer apply to beet?—There have been no extensive experiments.

3712. What would you say is the general opinion?—Some people have taken more than a general interest in it.

3713. You say that there is a general consensus of opinion that Natal has a suitable climate and soil for the production of beet sugar?—Yes, in this district.

3714. But you have had no experiments?—No, but we have produced the beets.

3715. How many people are employed in the various industries in this city?—I could not give this information off-hand.

3716. **(Sir Alfred Bateman.)** Now, I see in regard to the Empire trade mark, you say it is a matter you are in favour of. May I ask if your Chamber has considered the subject carefully?—Yes, from time to time.

3717. Because I may tell you that practically all the Chambers that have come before the Commission and all the bigger firms are against it, and we have found very little support for it where we have been. I wondered whether you had considered it carefully or whether you simply took the idea as being captivating?—No. Correspondence has taken place with the Empire Trade Mark Association, and it has received the attention of the local Chamber from time to time, and they have been convinced of the utility of such a trade mark, and have passed resolutions to that effect.

3718. **(Mr. Tatlow.)** In regard to the fruit canning industry, which you appear to consider a very promising one, may I ask if there is a sufficient supply of fruit at present available for starting such an industry?—There is not a sufficient supply available immediately, but if such an industry were started there would soon be plenty of fruit to supply all requirements. There are very large resources in the way of orchards in this district, and if people only took a little care, there would be enough fruit for such an industry in a very short time. At the present, large quantities rot on the trees and are wasted.

3719. Is the fruit-growing industry developing at all?—Not much, except in certain districts. In the Umvoti District it has developed considerably. Pears particularly do well. In this district, about 30 or 40 miles away, there are some excellent orchards. Apples do very well and also peaches, and a small canning industry has been started and is already being carried on.

3720. Did you say that large quantities were wasted?—Yes. **(Mr. Forsyth.)** Then, again, we grow very fine pineapples in this district. There is a large supply of what are known as Queen Pine.

TRANSVAAL.

Johannesburg, Friday, 3rd April, 1914.

Mr. Howard Wallace Soutter, Mr. Alfred Falkland Robinson, and Mr. Ernest Chappell, J.P., representing the Johannesburg Chamber of Commerce, called and examined.

(*For evidence of these witnesses on "Migration, Land Settlement, and Irrigation," see p.* 46, *on "Posts, Telegraphs, and Steamships," p.* 81, *on "Bills of Lading," p.* 91, *on "Railways, Harbours, and Coal for Bunkering and Shipment," p.* 140, *on "Empire Development," p.* 161 *of* [Cd. 7706]; *and on "Exhibitions," see p.* 124, "*Statistics*," *p.* 130, *and "Legislation," p.* 183, *of this volume.*)

The following statements had previously been submitted to the Commission in a letter from the Chamber dated February 4th, 1914:—

Trade.—Upon the establishment of Union, a separate Ministerial Portfolio of Commerce and Industries was created, and its subsequent abolition aroused the strong protest of the recognised commercial and industrial organisations.

British Empire Trade Mark.—Instead of such a mark as "Made within the Empire" the Chamber would prefer a system whereby the mark used should indicate the actual country or Colony of manufacture.

Misrepresentation as to origin.—Experience goes to show that misrepresentation as to origin of goods is not so prevalent as was once the case. It would, however, be more satisfactory if an International

Agreement could be arrived at, requiring goods to be marked with the name of the country of origin.

System of Trade Commissioners and Correspondents.

The Chamber has no direct information, as to the effect in encouraging British trade, of the appointment of Trade Commissioners for the several Dominions. It is considered that the system could probably be more effective if such Commissioners were in more direct touch with the Chambers of Commerce, and it is observed that, probably with that object, the Secretaries of the Chambers of Commerce in many of the principal towns have been officially appointed as correspondents under the Trade Commissioners. This Chamber is constantly receiving trade enquiries from all parts of the Empire and from foreign countries.

Mr. Soutter read the following additional statements:—

Ministry of Trade and Commerce.—On behalf of the Johannesburg Chamber of Commerce, we should like to supplement paragraph 4* of their letter to the Secretary of the Commission dated 4th February, 1914.

A strong protest was made at the time of the abolition of the Ministerial Portfolio of Commerce and Industries.

We venture to think that the selection by the Government of the gentlemen who respectively filled this office was an unhappy one, inasmuch as neither of them had direct experience or was acquainted with the trade and industry, other than the agricultural industry. The commercial community feel it is of the utmost importance that there should be some Minister who is thoroughly acquainted with commercial and industrial affairs, and to whom the commercial community could refer questions directly affecting their interests. We further consider that such a Minister would be of the greatest assistance in dealing with industrial disputes, and questions which arise between employers and employees. We would point out to the Commission that, amongst others, a Minister of Commerce and Industries would occupy a position equivalent to that of the President of the Board of Trade.

At the present time, the commercial and industrial bodies have to make representation to various Ministers instead of making such representation to what may be called their own Minister. As an instance of this, the resolutions of the Associated Chambers of Commerce, which met in Kimberley last year, had to be referred to at least six or seven Ministers. We would, therefore, urge upon the Commission the desirability of this Portfolio being re-established.

Marks of Origin.—The Chamber referred to this in its letter of the 4th February, to the Secretary of the Commission, and we would seek to emphasise the view of the Chamber that the mark should indicate the actual country or Colony of manufacture, and that, as far as the United Kingdom and the Dominions are concerned, it would not be desirable that they should have a common mark made within the Empire. The Commission will remember that when the mark of origin was first introduced, it formed an immense advertisement for the country of origin, especially in the case of Germany, and we think that each Dominion or country is entitled to whatever value there may be in such an advertisement.

3721. **(Mr. Sinclair.)** You represent that you think that there should be a Minister of Commerce and Industries. Can you tell the Commission whether trade was benefited during the period that there was such a Minister? — **(Mr. Soutter.)** Well, it is very difficult to answer that question, because I think the commercial community throughout South Africa realised that the Ministers who held that portfolio were not in intimate touch with them.

3722. I do not want to go into that?—And the department was never properly organised. I think that would be the correct answer to that question.

3723. You think that such an appointment would work for the benefit of the trade of the whole Union? —Yes, we do; and we also think, in addition to the trade of the Union, the Minister of Commerce—who would hold a somewhat similar position to that of the President of the Board of Trade—would be the Minister to assist in all industrial disputes.

3724. You mean as a mediator?—Yes, and as an investigator and conciliator.

3725. That is the attitude which the Minister who holds that Portfolio takes up in other countries, as you know?—Yes.

3726. On the subject of the system of Trade Commissioners and Correspondents you have a word to say as to the closer touch which you think desirable between the Commissioners and the Chambers of Commerce. Have you ever considered whether it would be desirable that the Trades Commissioner should hold the position of honorary member of the Chambers of Commerce. Would that have the effect, or would it be a convenient means, of bringing about that intimate touch which you desire?—We think it might, but our suggestion would be either that the Commissioner himself, or his Correspondent, at any rate, should be a member of the Chamber of Commerce. We suggest that the Secretary of the Chamber of Commerce might be the Correspondent of the Commissioner. At present the Commissioner in South Africa pays visits periodically to the different parts of the Union to gain information, and he is always welcomed by the commercial people, and all information we can give is afforded him.

3727. And you would be favourable to his occupying a seat on the Committee of the Chamber of Commerce, do I understand?—Personally, I should have no objection. It would probably mean an alteration in the Constitution.

3728. But it would make for the touch which you want?—Yes.

3729. **(Mr. Garnett.)** Referring to the British Empire trade mark. Has any consideration been given to the question of how the British Empire trade mark, which would be common to every production in the Empire, would affect existing trade marks?—I do not think it has, but we regarded that question merely as to whether there should be a universal trade mark for the United Kingdom and the Dominions on goods made within the Empire.

3730. You have not considered the question as to whether a mark which was intended simply as a mark of origin should eventually come to be looked upon as a mark of quality?—No.

3731. I mean applied to good and bad alike. If it were liable to debase the existing trade marks, which have enormous importance, you would not be inclined to favour it?—We have not considered that.

3732. In regard to misrepresentation, we had it in evidence that certain goods of British origin could only be bought without any mark on them at all. It was suggested that to enforce such a regulation as, for instance, that the goods have been made in, let us say, Great Britain, would, according to the testimony of manufacturers, result in that trade being lost, one of the conditions of their trade being that no mark whatsoever should be placed on the goods. Has that point presented itself to you?—No, it has not. But I cannot conceive any difficulty in some distinctive mark.

3733. I only mention this point because one of the largest and most important manufacturers of a certain class of goods in the whole world—perhaps the most important—gave it in evidence in London that to insist on any mark whatsoever indicating origin, quality, or anything else, would seriously and materially interfere with that trade. That question has not been considered by your Chamber?—No.

3734. **(Sir Alfred Bateman.)** In regard to Trades Commissioners and Correspondents, have you seen Sir Sothern Holland's reports that he makes annually?—From Cape Town?

3735. Yes, and also the particulars supplied to the Commercial Committee of the Board of Trade, where they show the important results of the encouragement of British trade from the appointment of British Trades Commissioners?—That is not before us. But we do say that these Trades Commissioners and

* See previous page.

Correspondents in all industrial centres would be an enormous improvement.

3736. Sir Sothern Holland's work has been considered by British manufacturers and others at home to be of the greatest importance?—**(Mr. Chappell.)** Hear, hear.

3737. I suppose you are in favour of British goods being used as much as possible?—**(Mr. Soutter.)** Oh, quite.

3738. I think it was suggested that the Trades Commissioner might be a member of the Chamber of Commerce, but if he was at Cape Town he would not be much here?—I understood in answering that question that there would be a Correspondent here, and also the possibility, perhaps, that the Commissioner himself might reside in Johannesburg instead of in Cape Town.

3739. On that point, do you consider it would be an advantage to British trade if we had either another Commissioner or a Sub-Commisioner up here instead of a Trade Correspondent?—I think it would be better. He would have a higher official standing.

3740. But your Chamber is often consulted from the Mother Country about getting into touch with users of goods?—Yes.

3741. And you see the Trades Correspondent here, I suppose?—On those enquiries?

3742. Yes.—No, the Secretary of the Chamber answers them direct.

(*See also evidence of Mr. H. W. Smyth, pp.* 1–8.)

LIST OF APPENDICES.

(c.) GENERAL TRADE QUESTIONS.

Commercial Travellers' Licences.

	PAGE
Appendix I.—Memorandum submitted on behalf of the Durban Chamber of Commerce ...	175
Appendix II.—Letter from Mr. Walter Butcher	176
Appendix III.—Letter from the Federated Commercial Travellers' Associations of South Africa	177

APPENDIX I.

The following Memorandum was submitted by Mr. Alexander Buchanan and Mr. Walter Butcher on behalf of the Durban Chamber of Commerce.

(*For the evidence of these witnesses see p.* 162.)

Commercial Travellers' Licences.

Evidence has been laid before your Commission by English firms, protesting against the alleged exorbitant taxation imposed in the way of licences upon their representatives travelling in South Africa.

It is felt that it is only right that your Commission should hear the other side of the case; and, speaking for the merchants and warehousemen of this and other towns, we would point out that, while we welcome the representatives of manufacturers and would favour a low licence charge for them, we feel very differently towards the representatives of oversea warehousemen and merchants or commission houses who travel the country in competition with us, carry no stocks on this side, employ no staff, and contribute nothing to the general taxation revenue of the country, except the licence they complain about. Local merchants or warehousemen have very large vested interests in the shape of lands, buildings, and stocks of merchandise, which are subject to heavy Government and municipal taxation charges. They provide occupation and a livelihood for a large number of employés and their dependants, and they consider they can fairly ask for legislation that will impose taxation on their oversea competitors through the only channel at present available, with the object of equalising the basis of competition.

From the point of view of the Municipalities and of the Government it must be apparent that it is to their interests to encourage the establishment and development of such businesses which add to the rateable value of the towns and increase their populations by attracting educated men who, with their dependants, are a most desirable class of burgesses, who eventually spread out into other parts of the country and play a large part in its general development and progress.

The existence and welfare of such hives of industry must always be of great importance to a country like this, which teems with natives and which, more than anything else, requires to increase its white population.

The following is a quotation from the Report of the Chamber for the year 1912 on the subject of Commercial Travellers' Licences:—

"The conditions under which licences are at present issued to commercial travellers representing houses not domiciled in the Union are as follows:—

"Cape Colony: 50*l.* per annum for the first house represented, 5*l.* for each additional house; maximum, 100*l.*

"Transvaal: 10*l.* per annum.

"Natal: 10*l.* per annum.

"Orange Free State: 5*l.* every three months.

"An undomiciled travellers' licence would, therefore, cost for the whole Union, minimum 80*l.*, estimating that he visited the Orange Free State two seasons during the year, and maximum 140*l.*

"According to reports which have appeared in some trade papers, an impression has got abroad that the Durban Chamber of Commerce is desirous of seeing an increase in the scale of licences for commercial travellers representing houses domiciled without the Union.

"The proposals made by the Chamber in 1911 and communicated to Government are as follows:—

"Every travellers or agent or firm of travellers or agents trading in *bonâ fide* partnership (excluding an association of travellers or agents), acting as representatives of one or more persons or firms not domiciled within the Union, must obtain a licence for the purpose of carrying on their calling. The charge for such licence to be:—

"For the Union of South Africa: 100*l.* per calendar year, 50*l.* per half calendar year.

"For the Cape Province only or for the Transvaal Province only: 50*l.* per calendar year, 25*l.* per half calendar year.

"For the Orange Free State Province only or for the Natal Province only: 25*l.* per calendar year, 12*l.* 10*s.* per half calendar year.

"The opinion has been expressed by members of the Chamber that a distinction should be made between travellers representing oversea manufacturers and travellers representing oversea commission houses and warehousemen. It is pointed out that

travellers of the second class are in direct competition with merchants domiciled in South Africa, who employ large staffs and pay rates and taxes and who are a direct benefit to the country. The competition in question seriously affects the welfare of a large section of the community who directly or indirectly depend upon the employment provided by the merchant houses established in South Africa."

APPENDIX II.

LETTER FROM MR. WALTER BUTCHER AS TO COMMERCIAL TRAVELLERS' LICENCES.

(*For Mr. Butcher's Evidence, see p.* 164.)

P.O. Box 1004,
Durban, Natal,
23rd March, 1914.

DEAR SIR,

WILL you kindly allow me to tender the enclosed letter as an appendix to the evidence given this morning on the subject of Commercial Travellers' licences? As you are aware, the matter was not discussed, and I did not have the expected opportunity of referring to it and tendering it as an addition to my evidence.

Yours faithfully,
WALTER E. BUTCHER.

The Secretary,
Dominions Commission,
Durban.

P.S.—The letter is from the head of a local wholesale warehouse firm, a former Chairman of our Chamber of Commerce.

P.O. Box 936,
Durban,
March 20th, 1914.

DEAR MR. BUTCHER,

WITH reference to the evidence that you propose to give before the Dominions Royal Commission, in regard to home travellers, and our discussion of Wednesday afternoon, I suggest that, while the matter you have so far arranged is quite good, it might be extended, perhaps, on the following lines:—

That the travellers of home warehousemen do a great deal of harm to the trade of this country must be admitted, when we take into consideration the fact that in the wholesale soft-goods trade alone in Durban it is calculated that there are at least 500 European employees. Taking their salaries at an average of 12*l.* 10*s.* per month, we have a salary list of roughly 75,000*l.* a year, and there should be added a similar number, I think, of native and coloured employees, whose wages and keep, provided by their employers, probably amounts to an average, say, of 2*l.* 10*s.* per month, or 15,000*l.* a year, so that the wholesale soft-goods trade in Durban alone circulates an amount approaching 100,000*l.* per annum in salaries and wages alone, and this leaving out of consideration the spendings of the principals. It can be fairly assumed, considering the number of married men that are employed as Departmental Managers and in other positions of responsibility by the wholesale soft-goods trade, that each white employee on an average supports at least one other individual, who is directly dependent upon him, taking juniors together with seniors; so that it will be seen that in Durban alone the wholesale soft-goods trade gives direct support to at least one thousand white persons. The importance of this trade will be realised when the number mentioned is compared with the total white population of Durban of 33,500, and what applies to the wholesale soft-goods trade will no doubt equally apply to other important trades in Natal, and will certainly apply in like ratio to other large distributing centres within the Union, such as Johannesburg, Cape Town, Port Elizabeth, and East London. Indeed, it may be fairly assumed that the distributing trade of Durban does not average one-tenth that of the whole Union. It will thus be seen that a very large section of white people throughout the Union is dependent upon the distributing trade of the country. This trade is seriously hampered and interfered with by the inroads that have been made into it by travellers who represent oversea warehouses. There would not be so much cause for complaint if these travellers confined their attentions to large businesses, that are financially strong enough to go past the wholesale houses of the Union, but, unfortunately, they go outside their legitimate sphere, and call upon all sorts of storekeepers in the different native territories, such as Zululand, Pondoland, and Basutoland, besides catering for the trade of small town storekeepers, as also of numerous wayside stores. These storekeepers are more often than not in a very small way of business, and are not financially strong enough to import goods direct, and when they place direct indents it frequently happens that they order far more goods than are necessary for their immediate requirements, as the home travellers cannot regularly call upon them every two or three months, with the result that they become over-stocked, and in some instances, notably along the reefs, goods are thrown on the market almost at any cost, in order to turn them into cash, so as to provide funds to meet the home drafts as they become due. It follows that the wholesale firms in the country suffer, as they are kept waiting while the drafts belonging to home houses are paid; so that there are three bad effects as a consequence of oversea wholesale warehousemen doing business with small storekeepers:—

(1) The storekeeper frequently over-stocks himself and financial embarrassment results;
(2) In order to temporarily tide over his financial embarrassment, he frequently realises goods at far below their proper value, and so not only adds to his ultimate financial embarrassment, but makes it difficult for his competitors to do business legitimately alongside him.
(3) The wholesale firms in the country suffer, not alone by being kept waiting for payment of their goods while oversea drafts are paid, but also by a crop of bad debts that frequently follow the over-trading that oversea traders are the immediate cause of.

Economically, it will surely be admitted, that it is desirable that a good class of white citizens should be found employment for within the Union, and the class of citizens employed by the wholesale drapery trade is quite as high as, if not higher than, those who are employed by may other trades within the Union. The employees of these wholesale houses possess, as a rule, more than average intelligence. They are well-educated, and take an active interest in the economic and political problems of the country; moreover, they take their part freely and fully in the defence of the country, and during the last native rebellion in Zululand the wholesale houses of Natal contributed in no small degree (in accordance with their numbers) to the forces of the Colony that suppresed the rebellion. This in itself is a very important matter in a young country such as this, and bearing in mind the disparity between the European and native populations, it is essential that everything should be done to increase the white population of this country, if only from the point of view of defence, although there are other reasons equally cogent why this should be done. One of these reasons is that the more trade that is kept in the country it naturally follows that the prosperity of the Union will be correspondingly enhanced.

I have spoken of the number of employees, white and coloured, in the wholesale soft-goods trade in Durban, but how about those other employees who are perhaps not directly dependent upon the trade, but are certainly indirectly dependent upon it to some extent; for instance, employment is found for a number of individuals who make packing cases for the local wholesale trade, employment is also provided for printers, landlords obtain suitable tenants for their dwelling-houses, while the municipality benefits by the rates that are levied on the wholesale establishments, as well as on the dwelling-houses of their employees, and the Post Office, railway, and other Government services naturally benefit from the use that is made of them; whereas, in the case of goods that are sent out direct from home to storekeepers in a small town, or on the veldt, little benefit can accrue to the Government, the municipalities, and the various industries of the country.

It is estimated that if the home travellers confined their operations to their legitimate sphere, the wholesale soft-goods trade in this country would be wellnigh doubled, and employment would, consequently, be found, if not for double, at all events for a much larger proportion of employees for whom work is now found by that trade, with the result that the Government and public services would reap considerable benefit, while the municipalities would likewise benefit in a corresponding degree, and room would be found for a much larger population within the Union of a well-contented and fairly prosperous body of individuals.

To assist in accomplishing this object it has been suggested that a licence should be required to be taken out by oversea travellers, at a cost of £100 per annum, the said licence to give them the right to pursue their vocation in all four Provinces of the Union, and it has furthermore, been suggested that an importing licence should be required to be taken out by merchants and storekeepers who import goods direct from oversea into the Union, of a minimum amount of £50 per annum, but the latter licence does not, of course, come within the scope of the Dominions Royal Commission.

It should be mentioned in passing that in connection with the suggestion that oversea travellers should take out a licence at a cost of £100 a year, no great hardship would be imposed, in view of the fact that licences for travellers representing foreign firms are required to be taken out by the various Provinces at the present time as follows:—

Cape Province...	£50
Transvaal	£10
Natal	£10
Orange Free State	£20
Total	£90

So that in the aggregate the cost would be only £10 more per annum; but, on the other hand, oversea travellers would be required to take out a licence for the whole of the Union, instead of for isolated Provinces as at present.

It may be said that if travellers of home warehousemen did not compete against travellers of warehousemen who are domiciled within the Union, country storekeepers might have to pay an increase in the local prices of goods. Against this, it should be pointed out that although the printing trade enjoys a protective duty of 25 per cent., competition in that trade locally is remarkably keen, and on numerous occasions I have found, after making enquiries at home, and in some instances having the work actually done at home, that on the whole we can get our printing work done much cheaper within the Union. The object of the protective duty is to keep the work within the Union, and in effect it has been found that it does not materially put up the price of printing, if at all.

You also pointed out to me yesterday that, notwithstanding the duty on candles, the price of candles that are now made within the Union is cheaper now than ever it was when supplies were drawn entirely from oversea. The wholesale houses do not ask for any special protective duty against oversea houses, but they do ask that substantial consideration be shown to them in view of the very large stocks they carry in this country (the great bulk of which are drawn from Great Britain) involving the employment of a vast amount of capital, which provides for the maintenance of a large number of employees, both white and coloured, for whom work is found.

Yours sincerely,
GEO. E. HANDS.

Walter Butcher, Esq.,
Durban.

I am sending a copy of this letter to Mr. W. G. Brown.

APPENDIX III.

LETTER FROM THE FEDERATED COMMERCIAL TRAVELLERS' ASSOCIATIONS OF SOUTH AFRICA.

Secretary's Office:
P.O. Box 828, Cape Town,
April 8, 1914.

Inter-Provincial Commercial Travellers' Licence.

GENTLEMEN,

As requested by members of the Dominions Royal Commission I submit a few points for their consideration upon the detrimental effect that inter-Provincial Commercial Travellers' Licences have on certain kinds of British manufactured goods.

We are all aware that the farming community, in the past, has been practically self-supporting, or at all events their wants were of the most limited description, and consisted, principally, of the rougher description of wearing apparel, which naturally induced the large coastal wholesale houses to adjust their stocks accordingly.

Some time ago a great advance was made in the coastal towns in the character and qualities of all kinds of wearing-apparel, a demand that the wholesale merchants, particularly of Cape Town, were not slow to take full advantage of, with the result that they are to-day carrying stocks of drapery, such as costumes, coats, millinery, dress goods, and all kinds of finer under-clothing, &c., of a character and value they would never have attempted to have stocked a few years ago.

This class of business has never yet been extended to the outlying districts, not because the demand is not there, but that the inter-Provincial Travellers' Licences exist, with the result that in many of those districts the inhabitants are content to dress in the simple way their forbears did, buying a few yards of print for a dress or a few yards of calico for underclothing.

It comes well within my own personal experience that this class of business has been entirely developed and extended by the commercial traveller throughout the Western Province, but is practically neglected in the inland Provinces, because of those inter-Provincial Licences.

As proof that a demand can be created, and a profitable one, I would instance the fact that most of the larger retail drapery firms of Cape Town have one or two men canvassing (retail) from house to house this particular class of goods, and all of them do very well.

We, as a body, are conscious that if those licences were abolished and free trading established throughout the Union, and even throughout the Empire, a great impetus would be given to all classes of goods, and particularly to the class of drapery and wearing-apparel I have stated. One of the results that would be sure to follow would be free competition amongst the merchants; and nothing develops trade like competition.

We have made more than one effort to ascertain the attitude of the Union Government on this subject, but so far with indifferent success. Therefore, the members of the Federated Commercial Travellers' Associations of South Africa feel that this is a subject worthy of your consideration, and they trust you will assist in opening up a free market to all trades throughout the Union and for ever abolish the anomaly of a Province of a unified country issuing licences to citizens who are the accredited representatives of established South African merchants, and styling them as representatives of a foreign firm.

I am, &c.,
JOHN MACKENZIE,
President of the Federated
Commercial Travellers' Associations of South Africa.

The Dominions Royal Commission,
Hugnenot Buildings,
Victoria Street,
Cape Town.

VII.—LEGISLATION.

CAPE OF GOOD HOPE.

Cape Town, Monday, 2nd March, 1914.

Mr. Advocate Louis Edmund Benjamin, K.C., LL.B., called and examined.

(*For the evidence of this witness on "Bills of Lading," see p. 87 of* [Cd. 7706].)

The witness submitted the following memorandum:—

Uniformity of the commercial law is essential to the solidarity of the inter-State trade of the Empire.

The sources from which the trade flows would be stimulated thereby. Mercantile classes in all parts would engage more freely in domestic trade if assured that their transactions were regulated by the same principles as they are acquainted with and accustomed to locally.

At present the various systems are more or less foreign to each other and give rise to mistrust.

At the same time unification of the laws would have the effect of tending to remove local anomalies and to broaden out the law, producing one uniform system from various systems, the ideal of comparative jurisprudence.

The time is quite ripe for unification of certain branches of the law, especially the commercial, English law having exercised a profound modifying effect upon the laws of the Colonies.

It is very desirable that there should be some central authority to proceed with codification, the codes to be circulated throughout the Empire or to be submitted to some representative body for approval before submission for legislative authority, with a view to securing by mutual agreement uniformity of legislation.

At the present time, without any conjoint action, portions of the English law have been adopted in the Colonies, but local peculiarities have been retained, *e.g.*, the Bills of Exchange Act, 1882, has been adopted in South Africa with the exception of the provisions relating to days of grace and the distinction between inland and foreign Bills; the existence of such differences is very undesirable, and probably would not occur under a system such as is suggested.

The elaboration of a code of commercial law common to England and South Africa is quite feasible, as can be shown by consideration of the chief branches of that law.

The essential features of the law of contract in South Africa are substantially the same as those of the law of England, save that there are fewer requirements of form and the question is an open one whether the doctrine of consideration has or has not been engrafted upon the law; but these are matters which would afford little obstruction to the adoption of an Act similar to the Indian Contract Act.

The law of sale of goods in the Union of South Africa might also be expressed in the terms of the Sale of Goods Act, 1893, 56 & 57 Vict. c. 71, except in respect of the time when ownership passes under a contract of sale, in regard to which the Roman-Dutch law has adopted the principle of the civil law; it is possible to assume that, if the Sale of Goods Act had, prior to enactment, been subject to inter-State consideration, this principle of the civil law might have been adopted.

The English law and the Roman-Dutch law as applied in South Africa are, in general, consistent on the subject of agency; they differ, however, in respect of the rights and liabilities of the undisclosed principal and the agent acting for him; but in framing a uniform code of law the conflicting doctrines of the two systems might with advantage be subjected to reconsideration. The South African law of suretyship differs from that of England in respect of the fact that, under the former, writing is not essential to the constitution of the contract, and in so far as the surety enjoys the benefits of excussion (discussion) and division: opinion cannot differ as to the desirability of insisting upon writing as a formal requirement, and in this respect South African law would be well amended; as to the benefits of excussion and division these may be, and are usually, renounced in practice, and if the law was made uniform on these points with that of England the change would be welcomed as dispensing with an unnecessary formality.

A large proportion of the time of the courts is to-day occupied with the affairs of the Joint Stock Companies, company law being an evolution of comparatively recent date. South Africa has had to make new law on the subject, and has perceived the advantage of adopting and taking over the company law to be found in the English statutes; company law is not, however, uniform throughout the Union; some of the Provinces have adopted the earlier statutes, some the later ones; this want of uniformity would probably not have occurred if legislation had taken place as suggested above.

The Law of Partnership well illustrates the advantage to be gained from legislation on a basis of comparative law; the principle of the limited liability of one or more of the partners has always existed in Roman-Dutch law; it has been adopted in English law only as recently as the year 1907; it is safe to assume that if a code of law on the subject had been framed for the Empire this principle would have found a place in it.

What has been said above with regard to company law applies *mutatis mutandis* to the law relating to trade marks and the cognate subjects.

The Cape Colony (now the Cape Province) adopted in the year 1879 the English law relating to fire, life, and marine insurance, stoppage in transition, bills of lading, and on all matters relating to marine and shipping law on which the Supreme Court of the Colony exercised concurrent jurisdiction with the now extinct Vice-Admiralty Court: in respect of such maritime and Admiralty matters it was felt to be absurd that the law to be administered should depend upon the particular court in which proceedings might be instituted, English law in the Vice-Admiralty Court and Roman-Dutch in the court of purely local jurisdiction; hence the introduction of English law and the supersession of the earlier law in all those matters on which there were concurrent jurisdictions.

The Law of Carriage by land is very similar in both countries. The law relating to banking and the Stock Exchange may be said to have been adopted in South Africa from English authority.

With regard to bankruptcy, any general law would have to depend to a large extent upon the local law for its application to such matters as the property to vest in the trustee and the priority of creditors, these matters being closely connected in South Africa with the system of public registration, a system which has been carried to great perfection here, and which it seems practically impossible to introduce at so late a date into the law of England; but although this is so, it is highly desirable that there should be some general law of bankruptcy, under which there would be a sole administration of concurrent and co-ordinated administrations of an insolvent debtor's estate throughout the Empire, with general effect in respect of his discharge from his liabilities.

Cape Town, 2 March 1914.] Mr. Advocate Louis Edmund Benjamin, K.C., LL.B. [*Legislation.*

3743. **(Chairman.)** The Commission are greatly indebted to you for the preparation of the paper which you have sent us on the subject of the uniformity of commercial law throughout the Empire. What steps do you propose should be taken to bring about this unification?—I think there should be some central council entrusted with the preparation of general laws dealing with specific subjects. You would have to proceed step by step.

3744. You suggest calling together a series of *ad hoc* commissions?—I would rather prefer a standing commission, I think, on which commission the legal systems of the various portions of the Empire should be represented. It would, perhaps, be somewhat difficult to entrust a commission consisting of representatives of only one system of law with the preparation of a code of laws that would apply to the Empire at large.

3745. When this commission had done its work the codified law would have to be passed by the representative Legislatures of each of the Dominions and the Mother Country?—Yes.

3746. They could only prepare a draft for submission to the various Governments and Legislatures?—Yes.

3747. Do you think that on matters of principle or detail there would be great difficulty in arriving at a satisfactory result?—On some points I think there would not be any serious difficulty, whereas on others it would be otherwise, because some of the differences in commercial law are rooted very deeply in principle: some of the laws would have to be approached in a spirit of concession. I might refer, say, to the difference between the South African law or Roman-Dutch law and the English law of Sales. While under the English law the ownership of property, for instance, passes at once as soon as the contract is completed, under the Roman-Dutch law it only passes on actual delivery. In the English law it seems to me that the principle is founded on deep lying custom, and there might be some difficulty perhaps in assimilating the two systems of law in this respect. I do not think that those who practice Roman-Dutch law would likely advise a renunciation of the principle. I should say there may be some difficulty in cutting away the principle of the English law, which goes so deep. But that seems to me to be only a matter of time, and I fancy that if the question were considered, some compromise might be arrived at between the two systems.

3748. I wish to be quite clear as to the machinery which you suggest. You say a commission composed of the representatives of the Mother Country and the Dominions?—Yes, especially those Dominions whose system of law are fundamentally different from the English system, *e.g.*, Canada and South Africa. In the Australian Colonies you have British law, and perhaps it would not be quite so necessary to have those represented on the commission as it would be in the case of, say, Canada, where the law is founded on the French system, that is Lower Canada. Upper Canada has British law.

3749. What would you say regarding the inconvenience of the present condition of affairs?—The inconvenience is such that it leads to the greatest uncertainty. Merchants in one part of the Empire do not know the principles of law that apply to particular transactions in other parts of the Empire, and this uncertainty leads to the greatest doubt and mistrust. The systems of law in one portion of the Empire are looked upon as foreign in another portion.

3750. Appeals from here go to the Privy Council?—Yes.

3750A. They decide cases on the particular local law governing the facts?—Yes.

3751. They as a tribunal have to apply all these different laws in succession?—Yes. They may have to apply one day Spanish law, another day Roman-Dutch law, and another day French law founded on the Code Napoléon, and at another time they may have to apply Indian law.

3752. Has any proposal ever gone home from South Africa on this subject?—I do not think any proposal has gone home from here.

3753. Has this matter been under discussion here in the Assembly?—No. Up to now we have from time to time taken over portions of the law of the Mother Country. Sometimes we have taken them over *en bloc*, at other times we have taken them over subject to certain local modifications. The greatest portion of the shipping law we have taken over *en bloc*. On the other hand, in the case of such a law as that governing Bills of Exchange, we have taken it over subject to certain modifications. For instance, here we do not recognise what are known as days of grace, and we draw no distinction between inland and foreign bills.

3754. **(Mr. Sinclair.)** You know, Mr. Benjamin, that there has been a general disposition on the part of the Australasian Colonies, at any rate, to get as close as they can on certain subjects to the English law. In other words, to follow English legislation on certain subjects. You know also that a good many of these questions have been brought up at the Imperial Conferences that have been held in the Mother Country?—Yes.

3755. But as I gather from your evidence, you think that the time has come when there should be a more acute movement to bring the laws into accord as far as it is possible to bring them?—Oh, I think so. I think there is every desire on the part of South Africa.

3756. And that, while the existing legislation of the Colonies has been brought up on certain questions fairly close to that of the Mother Country, the time has come for an active body to be set up that would go into this question and try to assimilate the laws as far as it is possible to do so. That is broadly the view which you take?—Yes.

3757. As regards patent law, for instance. I do not know what your legislation is here, but in some Colonies, as you know, the legislation of the Mother Country has been closely followed, following up the discussions that have taken place at Imperial Conferences. I would like to get your opinion on one or two heads of legislation. At the outset it would seem that local conditions and local policies may be so essentially different that it would not be possible to assimilate the governing laws. One saw, for instance, in the papers either to-day or on Saturday that there is a movement in the Mother Country to introduce an Act that is intended to be the basis of a universal Act on the question of naturalisation?—Yes.

3758. The difficulties that suggest themselves to such a general enactment are apparent, and I would like you to give the Commission your views on that question broadly as living in a country where there are both black and white citizens?—That is a question I have not specially considered, but it has always struck one as an anomalous condition that a person who is a citizen of one portion of the Empire is not necessarily a citizen of every other.

3759. That is so, but at the same time it is apparent, is it not, that that might involve conflict in policy between countries which take up a particular attitude on the question of colour? — That is undoubtedly so.

3760. That is one of the difficulties that seems to be suggested by this question. Now on the subject of suretyship. That is one of the cases, I think, in which you point out there is a difference between your local legislation and the law of the Mother Country. You favour, do you not, the insistence of their being in writing?—Yes.

3761. In that respect you support the legislation of the mother country? — Yes; there is a singular absence in our laws of the formal requirements of writing, and it is highly desirable, I think, that we should follow English law.

3762. Is the surety here entitled to step into possession of the principle as regards securities?—Yes. He is entitled to what is called cession of action.

3763. **(Sir Rider Haggard.)** I understand you want to consolidate certain commercial laws?—Yes.

3764. As a matter of practical business, how would you set to work to do it?—I would take a branch of the law at a time. I would not attempt to consolidate the whole of the commercial laws at once.

3765. You would do it piecemeal?—Yes.

3766. Would not the same machinery do the whole thing?—Yes, I think so, but I think the draft laws

would have to be prepared and would have to be circulated through the various States, and they would have to be subsequently submitted to the consideration of the Legislatures: I think it would be too big an undertaking for this Commission or body which sits to prepare a whole code of laws at once. Take, for instance, an Act like the English Bills of Exchange Act and your English Bills of Sale Act, which took a considerable time to prepare and to pass the Legislature. It would be more desirable to do the thing piecemeal.

3767. Then you suggest that you should get Acts passed by all the Legislatures of the Empire?—I think that would be essential.

3768. And finally by the Imperial Parliament?—Perhaps it would be desirable that they should be passed concurrently as far as possible.

3769. You do not see any difficulties in getting this done?—Of course, there are difficulties to concurrent action, but it does not seem to me that the difficulties would be insuperable.

3770. You think the case is so cogent and so urgent and the reasons for consolidation are so strong that you would be prepared to face those difficulties and submit to the various Legislatures of the British Empire a codified law? I think so.

3771. It does not strike you as beyond the range of practical possibility?—I think, of course, that there are great difficulties, but I do not think that it is absolutely impossible.

3772. You are bearing in mind, I suppose, the congested state of the British Parliament at the present time?—Yes, but, notwithstanding that, such Acts as the Bills of Exchange Act and other non-contentious matters have been passed through the Legislature.

3773. But at any rate you think that is what should be done, and you think it could be done?—I think it could be done and should be done, although it may occupy a very long time, probably more than a generation, to produce a satisfactory codification of the whole commercial law.

3774. **(Mr. Lorimer.)** Is it the prerogative of the Union Parliament to make commercial laws for the whole of the Union?—Yes.

3775. Then I find from your memorandum here that you say that the Company Law is not uniform throughout South Africa, but each Province has its own. Did the Union take over those laws and allow them to continue?—Yes. The laws of the Union have not been consolidated. The greater portion are uniform, but there are local statutory differences. I have instanced the Company Law of the Transvaal, which is not the same as the Company Law of the Cape Province.

3776. Of course, what you say is that the Company Law is not uniform. Some Provinces have earlier statutes and others have later ones, and you say that is of no essential importance?—No, not so far as general codification is concerned. What I intended to point out is this, that if there were some system of uniform legislation in the Empire for the preparation of a general code such as I have suggested the necessary consequence in South Africa would be that the laws would become uniform.

3777. I follow that, but as you have differences apparently in the different Provinces, is it conceivable that the Union Parliament might pass a commercial law that would conflict with some Provincial law at the present moment?—The only reasons for the difference of the local law such as I have referred to are these. That up to 1910 instead of having one uniform Legislature for the whole Union there were four different Legislatures at work. In the Transvaal the company laws were enacted by the local Legislature, and they adopted the latest English law, whereas our law in the Cape Province goes back to 1892, and then it was drawn up on the earlier English Acts. The adoption of the earlier or later Company Law was not a matter of principle, but merely due to the accident of time when that particular Legislature considered the matter. It is only a difference in time, but certainly if there were a uniform system of legislation for the Empire there would be encouragement for the local legislation to become, as far as possible, uniform.

3778. Would you kindly explain what is the system of public registration which you say has been carried to great perfection here?—I refer to the registration in connection with the ownership of land. The titles to property here and the encumbrances on property are registered in a central office, whereas in England there is no such system of central registration, but only a voluntary one, which I do not think has worked very satisfactorily. In this country the title of land can be ascertained with absolute certainty by an enquiry which may extend over an hour perhaps, but in England an enquiry as to the title of land is a matter that may extend over years owing to the great number of interests that have grown up in connection with the tenure of land and the fact that there is no system of central registration of title. Now the title to property which would pass on bankruptcy to a trustee, as far as immovable or real property is concerned, might be ascertained at once by an enquiry at the office of the Registrar. In England all sorts of equitable conditions have to be considered which have not to be considered here; so that if you had some general system of bankruptcy legislation the consequence would be this, that you might have property here which would not vest in a trustee in bankruptcy which, if it were held by a similar title in England, would vest. This is the distinction I wish to point out. You might have a title acquired in England by a bankrupt by depositing his title deeds, but in this country no deposit on title deeds will give any such right; there must be actual registration. Therefore a merchant in England who is dealing with a merchant in South Africa might think that he had obtained good title to a particular piece of land by reason of the fact that he had the title deeds deposited, but that would not be the case; to that extent I do not think you could frame a system of bankruptcy law that would work uniformly throughout the Empire; the local law would have to be considered.

3779. In the first sentence of your memorandum you say: If there were some codification of the mercantile law the merchant classes in all parts of the Empire would engage more freely in domestic trade. You mean the domestic trade of the Empire?—Yes.

3780. It would be valuable, but it could only be prepared, as you say, by some central authority authorised by each of the Parliaments concerned. Can you say that South Africa would be willing to engage in such a preparation as a code of mercantile law?—I think so, because they have shown themselves quite ready, at all events, to adopt the codification that has already been prepared in many cases in England. Take the case of the Bills of Exchange, we have taken over that Act almost in its entirety.

3781. So far as the codification of the whole of the laws of the Empire are concerned that is probably a long way off, but you think that a codification of the mercantile law is practicable and could be effected in reasonable time?—Yes, I think so. I would not like to limit myself to the quantity of time required for the purpose. It would probably be a matter that would extend over a generation, but it is advisable that it should be commenced.

3782. **(Sir Alfred Bateman.)** I take it you know all about the system which has obtained in Great Britain of taking part in International Conferences on certain subjects, and by that means gradually bringing the various countries together in matters such as patents, copyrights, trade marks, and so on?—Yes.

3783. We have had conventions and agreements on the matter of copyright law?—Yes.

3784. We have then got more and more countries to come in and so got nearer together?—Yes.

3785. And we have got the copyright law now to run for fifty years after the author's death?—Yes.

3786. Do you think that South Africa would be likely to come into these conventions?—Yes. So far as copyright and trade mark laws are concerned we have practically taken over the law of England. We have not taken over the latest law, but I see no reason why we should not. The only reason, I suppose, is that we have not had time to legislate, but we certainly adopted the earlier law. Our last Trade

Mark Act is founded on the one of 1888, and the Act you refer to, I think, is the one of 1908.

3787. And we have had the Convention of Washington since then, when some more changes were made?—Yes.

3788. You think, on the whole, that the South African Government would be likely to come into this arrangement?—Yes. Trade marks and patents are matters so essentially of modern evolution that we are largely dependent on the law of England on these subjects.

3789. You have not got a great neighbour by your side, such as Canada has in the United States, drawing them towards that side?—No.

3790. Suppose you had your Commissions, and after some years they came to an arrangement and this draft was sent round to all the Legislatures; this draft would be a convention, would it not. What I mean is this:—If the Commission has agreed to anything, that agreement has to be signed and you have to ratify it, and no one country can alter the convention by itself?—I do not look upon it as a convention.

3791. You look upon it as *ad referendum*?—Yes.

3792. Then all the work would have to be done again after the drafts had been received back?—Yes. I rather look upon it in that way, and it would be perfectly competent for any particular Legislature, if it pleased, to reject the law submitted or to modify it, but if they rejected or modified it they would, of course, be subject to all the disadvantages that would arise because they had not a uniform law with the rest of the Empire. You do not think of making this draft into the nature of a convention?—No, that seems to be fraught with so many practical difficulties.

3793. **(Chairman.)** If it is adopted subject to modifications you are not much better off than you are now?—No, that must be left to the sense and wisdom of the respective Legislatures. That is what happened in connection with the bills of exchange. We took over the English Act, but we did not adopt the principle of days of grace, for instance, and distinction between inland and foreign bills. But then Great Britain has also been represented at conventions that took place on the Continent in connection with the drawing up of a uniform system of bills of exchange, and Continental countries desired Great Britain to come into uniformity with them in the matter of days of grace and the distinction between inland and foreign bills which are unknown on the Continent, but Great Britain has not yet fallen into line; the probability is, nevertheless, that it will do so in time. We are more in agreement with Continental practice in that respect.

Cape Town, Tuesday, 3rd March, 1914.

Mr. John William Jagger, M.L.A., Wholesale Merchant and President of the Cape Town Chamber of Commerce, called and examined.

(*For evidence of this witness on "Exhibitions," "Statistics," and "General Trade Questions," see pp.* 124, 127, *and* 145 *of this volume; and on "Land Settlement and Irrigation," "Steamship, Post, and Telegraphic Communications," "Harbours, and Coal for Bunkering," "Empire Development," and on "Fruit," see pp.* 6, 60, 102, 160, *and* 317, *of* [Cd. 7706].)

3794. **(Chairman.)** In regard to patent rights, have you anything special to say?—In regard to that, we are in this position: we have been pressing the Government for a considerable time to bring forward a Consolidating Act; we have a different law as regards patents for every Province. Before we thought of doing anything further we should want our own local laws to be consolidated.

3795. And similarly, I presume, with commercial law?—Oh, yes. At present we have different insolvency laws in each Province, and that has been found to be excessively unsatisfactory.

3796. What progress is being made towards consolidation?—It is very slow

NATAL.

Durban, Wednesday, 25th March, 1914.

Mr. H. G. Mackeurtan, of Messrs. Shepstone and Wylie, Associates and Solicitors, called and examined.

3797. **(Sir Alfred Bateman.)** We have received your *précis* on Commercial Law, but I am sorry to say that several of the Members have not been able to see it. It would, therefore, be quite useless for the Commission, particularly those Members who are legal and who have been unable to peruse the statement, to have any examination of you on this subject. What we propose to do, therefore, is this: if you like, we will put it in but without examining you orally. I gather, however, from the paper that your point is this: that it is no good South Africa talking about coming into uniformity in regard to legislation on commercial law, because she has not put her own house in order?—Yes, and, secondly, we have a system of law which is different in many respects from English law.

3798. Yes. You have Roman-Dutch law, for instance?—Yes. So there is really nothing on which to examine me. I just put my statement in for what it is worth.

The following is the Memorandum submitted by the witness:—

Report.

I regret that owing to pressure I am unable to put in as full a written statement as I should have liked.

I understand I am desired to give evidence on the question of the advisability and feasibility or otherwise of the uniformity of commercial law throughout the British dominions, but, before coming to that, I notice there are several subjects in the list handed me which are questions of particular application of this general principle, viz., Arbitration awards, Empire trade-mark, naturalization, patent laws and trade-marks. I hope to deal with these later on.

Broadly speaking, there can, in my opinion, not be the slightest doubt of the advisability of uniform commercial law throughout the dominions, but in Natal we are faced with two practical difficulties. The first of these is the existence throughout South

Africa of Roman Dutch Law as opposed to English Law in the dominions, with the exception of British Guiana and Ceylon, and the second is that there is not even uniformity of commercial law so far throughout South Africa, and until the laws of the four Provinces are assimilated, either by means of statutes or by means of interpretation of the highest court in the land, there are grave practical difficulties in the way of the Union becoming a party to any scheme for the unification of commercial law.

There is a third difficulty also; but as that is a difficulty which is present whenever uniformity is sought it has no special or particular application to this Province. I refer to the fact that, in order to secure uniformity, you must, I think, have a code, and there are certain objections to every code, the main one of which is its inelasticity, and the fact that there must arise, in the application of every code, what one calls the difficulty of competing analogies, that is to say, the arising of different sets of facts which are on the border line between two provisions of the code, or are not covered by the code at all.

Dealing with the first objection, it may be of interest if I show some of the essential differences which exist between English and the Roman Dutch Law. I think commercial law includes the following:—

(1) Contracts.
(2) Purchase and sale.
(3) Bailments.
(4) Letting and hiring.
(5) Patents and trade-marks.
(6) Insurance—Fire, life, and marine.
(7) Bills of lading and charter parties.
(8) Mortgage and pledge.
(9) Transfer of land.
(10) Suretyship.
(11) Arbitrations and awards.
(12) Negotiable instruments.
(13) Partnership and agency.
(14) Company law.
(15) Bankruptcy.

So far as (1) Patents and trade-marks: (2) Insurance; (3) Bills of lading and charter parties: (4) Arbitrations and awards: (5) Negotiable instruments: (6) Company law, and (7) Bankruptcy are concerned, I see no great difficulty in providing a uniform code for the dominions, so far as South Africa is concerned, for the following reasons:—

The law of patents, negotiable instruments, bankruptcy, arbitrations, and companies is regulated in South Africa by statutes which are founded upon the English Patent Acts, the Bills of Exchange Act, the English Arbitration Law, and the English Company and Bankruptcy Law, though in any system of uniform codification there would have to be taken into account the judicial decisions of the various courts in South Africa on the statutes. This may, of course, sound arrogant, but it is common cause that the decisions of some of the South African judges are worthy of a place in the judicial annals of the Empire, and this has been recognised by the promised publication very shortly of an Empire Digest, under the supervision of Lord Halsbury, as a complement to the invaluable text book supervised by him known as the Laws of England.

With regard to company law, I wish to say that there is considerable laxity in Natal as regards the carrying on of a business with limited liability, due to the fact that the Natal Companies Act dates from the sixties, and I think the country would welcome a far more stringent company law based on the provisions of the Companies Consolidation Act of Great Britain, 1908. A step in this direction has been made by the Transvaal in their recent Company Act, but as far as I am aware, no steps in that direction have been taken by the other three Provinces.

As far as insurance, bills of lading, and charter parties are concerned, the reason why there is no difficulty in their case is that these subjects receive little or no attention at the hands of the Roman Dutch Text Book writers, and the courts of South Africa almost invariably follow the English decisions where they have not a statute, as in the Cape, incorporating the English law. In addition to this, there is also the fact that the Merchant Shipping Act, in many of it provisions, applies throughout the dominions.

As regards the remaining subjects, I see great difficulties, and if I instance some striking differences between the English and the Roman Dutch Law, for which I am indebted mainly to Professor Morice's Handbook called "English and Roman Dutch Law," I may perhaps make my point clearer.

Mortgages.—In England a mortgage is a transfer of the legal ownership, leaving the equitable ownership in the mortgagor, whose only right is an equity of redemption. Under Roman Dutch Law a mortgage does not affect the ownership, but is merely a charge against the property registered in the Deeds Office of each Province. In Roman Dutch Law there is no place for the equitable mortgage of English Law, which may be created by various means, as, for instance, the pledge of title deeds. In South Africa a mortgagee cannot sell the property without the decree of a competent court. In Roman Dutch Law there is no place for the "tacking" of mortgages which exist in English Law, or for the consolidation of securities. Under Roman Dutch Law there is no power of sale as exists under English Law. In English Law there is no place for the general mortgage as opposed to the special mortgage which exists under Roman Dutch Law. The rights of the mortgagee on bankruptcy vary very, very materially in South Africa from the rights in Great Britain.

Contracts.—The South African Courts have not yet fully adopted the doctrine of consideration, upon which so much reliance is placed in England, nor is there under Roman Dutch Law any peculiar sanctity in a deed such as there is in the English Law.

A very strong difference exists in joint contracts. Under English Law a joint contractor is liable for the whole, and the death of two joint debtors renders the survivor solely liable to the creditor.

This is not the case under Roman Dutch Law.

In South African Law cessions of contracts or "chooses in action" are fully recognised, whereas in England the only assignment of these rights that is allowed is an absolute one. There are material differences as regards the right to charge interest. Gifts under Roman Dutch Law require acceptance, and if above the value of 500*l.*, require registration in the Deeds Office, and, even so, the gift is revocable under certain circumstances. This is not the law in England

Purchase and Sale.—The purchase and sale of real property is materially different in the two countries owing to the fact of the existence here of registration of title as a universal law, and I may say that the system here prevailing is, to my mind, infinitely superior to the system which prevails in England. I say nothing as to the possibility of such a system in England, where the question of registration would appear, however suitable, to have before it the united opposition of the legal profession, and the almost insuperable difficulty of classifying the titles recognised under the English Law. However, knowing, as I do, that it is possible in certain districts of England to register title, and that this is said to be a failure, I wish to point out that under that system it is possible to register three kinds of title: an absolute, qualified, or possesser's, and that, therefore, the system cannot be said to have had a fair trial.

As regards the sale of movables, it might be possible to introduce here a code in the form already in force in England under the Sale of Goods Act, but the differences between English and Roman Dutch Law of sale are marked, both as regards the passing of ownership and the passing of risks—as regards the right to recover stolen property, as regards the question of executory and other agreements, as regards the old Roman redhibitory and *quantim minoris* action which still exist in South Africa concurrently with the *actio empti*, and so on.

Partnership.—With regard to partnership, there are material differences between Roman Dutch Law and English Law as codified in the Partnership Act of 1890. Under our law partners are jointly and severally liable for the whole debt, which they are not under English Law.

Partnerships *en commandite* and anonymous partnerships are unknown to English Law, and are fairly frequent in South Africa.

Letting and hiring.—The distinction between the law of letting and hiring in England and South Africa is most marked. English Law is particularly kind to the landlord, and South Africa is particularly kind

to the tenant. For instance, the following duties devolve upon the landlord under Roman Dutch Law and not under English Law: not to disturb the lessee, and to warrant him against interferences; to maintain the thing let in a proper state so that the lessee can make proper use of it; to compensate the lessee for damage caused to him by essential defects. Under English Law the landlord has a right to distress. Under South African Law he has what is known as hypothec, which he cannot exercise himself without the intervention of the court. With regard to leases of immovable property, leases for ten years or over in South Africa are regarded as immovable property, and are not binding against the landlord's successors in title unless registered against the title in the deeds office. This does not exist in England.

In England mortgagors may grant leases which are valid against the mortgagees under the Conveyancing Act, 1881. No mortgagor in South Africa can grant a lease to the prejudice of the existing mortgage, and if the mortgage is foreclosed the property may be sold discharged from the lease.

Under English Law the lessor and lessee may assign their interests unless there is a stipulation to the contrary. This is not the case in South Africa. The lessee, for instance, of what is known as a rural tenement cannot sublet or assign without the consent of his landlord.

There are no important differences between the English and Roman Dutch Law on the subject of contracts of letting and hiring of services.

Suretyship.—No woman could become a surety for her husband or any other person in accordance with Roman laws, and there is necessary to the validity of a guarantee by a woman either the renunciation of the benefits conferred upon her by the Roman Dutch Law, or the observance of statutory formalities provided as in Natal. Under English Law the giving of time to a debtor releases the surety. This is not so under Roman Dutch Law. Under Roman Dutch Law the surety can claim against the creditor certain benefits provided by the Roman Law, viz., the right to compel the creditor to excuse the debtor first, and the right of division of liability where there is more than one surety. These benefits are not known to English Law.

With regard to bailments, I do not think there is any very material difference, except that the English Law has become involved by statutes.

I now come to the distinctions between the Roman Dutch Law as interpreted in the various Provinces in support of my statement that I think we should put our house in order before we can possibly hope to become a factor in an Empire code.

(1) The Transvaal Courts have held that consideration is not necessary for a contract, that *causa* or a deliberate motive is sufficient.

The Cape Courts have held the reverse, and so far no one has been bold enough to test the question in the Appeal Court; the Appeal Court being composed sometimes of a majority of old Transvaal, and sometimes a majority of old Cape, judges, none of whom is likely to depart from the considered views delivered by him, makes the question one of some nicety, and perhaps acts as a deterrent.

(2) In Natal the rights of mortgagees on insolvency have been very, very far extended, the decisions purporting to be based upon the Natal Statute law; but these decisions, in in my humble view, are not necessarily warranted by the statute, and are in direct contradiction with the decisions of the other Provinces. In Natal the tendency has been in the past to follow the English Law more closely than the Roman Dutch, and in one case already one of the old Natal decisions on the question of landlord and tenant has been overruled by the Appeal Court as being inconsistent with Roman Dutch Law.

If I had time I could multiply instances where the different courts of the various Provinces have given contradictory decisions, though I must say that the main difficulty presents itself as regards the statutes of the various Provinces. Until the Statute laws of South Africa on such subjects as bankruptcy, patents, partnership, contracts in writing, and numerous other points of essential importance to commercial men are consolidated and unified, South Africa will not, for the purposes of a uniform commercial law, present an undivided exterior, and I think our right road is rather, as I have said, to put our own house in order with a view to being important participants in an undoubtedly desirable course, namely, a uniform code of commercial law throughout the Empire, which, whatever may be its inherent defects, will be a great advance towards the ideal legal state.

TRANSVAAL.

Johannesburg, Friday, 3rd April, 1914.

Mr. Howard Wallace Soutter, Mr. Alfred Falkland Robinson, and Mr. Ernest Chappell, J.P., representing the Johannesburg Chamber of Commerce, called and examined.

(*For evidence of these witnesses on "Migration, Land Settlement, and Irrigation," see p.* 46, *on "Posts, Telegraphs, and Steamships," p.* 81, *on "Bills of Lading," p.* 91, *on "Railways, Harbours, and Coal for Bunkering and Shipment," p.* 140, *on "Empire Development," p.* 161, *of* [Cd. 7706]; *and on "Exhibitions," see p.* 124, *on "Statistics," p.* 130, *and on "General Trade Questions," p.* 173, *of this volume.*)

In a letter dated February 4th, 1914, *the Chamber had submitted the following notes:—*

Legislation.

(*a*) *Double Income Tax and Death Duties.* — The Chamber requested General Botha to raise this question at the last Imperial Conference. The levying of double taxation is considered to be most inequitable, and to act as an impediment to the investment of capital in Colonial enterprises.

(*b*) *Patent Rights and Trade Marks.*—It is considered as a matter of importance that there should be uniformity of legislation in Great Britain and the dominions providing for the due recognition and effective protection of patent rights and trade marks.

(*c*) *Codification of Commercial Laws.* — Although in many respects trade conditions in the several dominions differ from those in Great Britain, yet there are many directions in which uniformity or agreement should be effected. In this connection might be considered (besides the subjects in (*a*) and (*b*)), weights and measures, company law, insolvency, certificates of origin and preference, foods and drugs adulteration, arbitration laws, duties on catalogues, licences of commercial travellers, trade combines and trusts, registration of businesses, &c.

Mr. Soutter read the following additional memorandum:—

Patent Rights and Trade Marks.—The Commissioners will be aware that a bill has been drafted dealing with patent rights and trade marks for the Union of South Africa. This bill has been drafted and follows very closely the procedure of the English Act. There are many obstacles in the way of uniformity of legislation in Great Britain and the dominions, especially in regard to working provisions. It will at once be seen that the working provisions of the English Act are inapplicable to local conditions. In the Colonies there are few facilities for constrnc-

tion, and the Colonies are not so advanced in arts and manufactures as in the Old Country, and it would be impossible for an inventor, say of an engine, to have it constructed in this country. But we would venture to point out certain anomalies which exist, and which might be amended. Under the United Kingdom Act of 1907 an invention need only be unknown in the British Isles to enable it to be patented, and an invention which has not been used during the fifty years preceding the application for patent can be protected.

In the Transvaal at the present time, the invention must be universally new, and the application must be by the actual inventor.

In the Cape and Natal Provinces the invention need not be universally new, and the first importer of the invention can protect it, and the applicant need not be the actual inventor. We would submit to the Commission that there should at least be unanimity in these matters, and would suggest that the provisions of the English Act in these directions should be taken as the model.

Another matter of outstanding importance is the inadequacy of official examination of Colonial patents. In the Transvaal there is in practice no examination. Formerly applications for patents were referred by the Transvaal officials to scientists and experts at Cape Town, but this has been discontinued, and all that is necessary now is that the invention be properly explained so that the claims can be easily followed. In the United Kingdom there is a staff of highly-trained technical experts, and the examination of an application for a patent is subject to an exhaustive enquiry for similar inventions during fifty years previous. In Germany and America the official examination is even stricter than in the United Kingdom, and we believe that in Germany investigations are made dating from the earliest records in 1615. It is not suggested that in a new country like South Africa it would be possible to have official experts who could carry out this work. This will be seen at once by comparison with the number of applications for patents. The average number in the Transvaal a year is 600, and for the first quarter of this year, 1914, there has been a decrease in applications of 20 compared with the same period of last year. In the United Kingdom and in Germany the rough average of applications is 30,000 and in America from 50,000 to 60,000 per annum, so that the expense in South Africa of highly trained experts would not be justified.

There are difficulties in the way of South Africa accepting the registration of a patent in the United Kingdom as *prima facie* evidence of novelty as the patent in the United Kingdom need only be unknown in the British Isles, but we would suggest that it might be possible, where a patent has been granted in the United Kingdom, for the Colonial Registrar to grant provisional protection on the plans, specifications, &c., accepted by the office in the United Kingdom, leaving it open for objections to be raised in the Union.

3799. **(Mr. Sinclair.)** As regards patents and trade marks, you have projected legislation on that subject bringing you as closely as you can get to English statute law?—**(Mr. Chappell.)** Yes.

3800. I am not quite clear whether you favour the system that at present exists in the Transvaal when applications are made for patents. All that is necessary now, I understand, is that the invention shall be properly explained, so that claims can be easily followed. Are you satisfied with that?—I am not certain as to the technical requirements of the law.

3801. You have here some useful criticisms and suggestions of improvements that might be made, but I do not gather clearly from the statement what particular attitude it is that you desire to present?—**(Mr. Soutter.)** Well, sir, in the first place there is no doubt that technical examination is of the utmost importance, but, as we point out, that involves highly-paid experts and scientists, and it is quite out of the question as far as we are concerned.

3802. You do not suggest that they should be appointed?—No; we cannot suggest that.

3803. Have you any suggestion to make that would be applicable to the existing conditions, or are you satisfied with what exists in the Transvaal to-day?—Not to-day, but we are satisfied with the Bill that is before Parliament and which we have gone through very carefully, and which, we think, will meet the case.

3804. That is the outcome of the representations of your Chamber?—Yes.

3805. You say in regard to patents that it might be possible, where a patent has been granted in the United Kingdom, that the Colonial Register should grant provisional protection on the plans and specifications accepted by the office in the United Kingdom, leaving it open to objections to be raised in the Union. Is that protection not given to-day under the existing Convention? Does the protection when it is applied for in, say, the mother country not relate back?—I think not, sir, in this country. I believe application has to be made to the Registrar here, and the point we made there was that, where a patent has been granted in the United Kingdom, the detailed specifications and plans should be accepted by the Registrar here, at any rate as *prima facie* evidence of *bona fides*, and that every opportunity, however, should be given to opponents to the patents to object. There seems, of course, to be this difficulty, which I have thought of since, that in the United Kingdom their records are kept in a certain way and have to be printed in a certain way, and whether the papers which would be filed in the Colonial Office are filed merely as copies or not I am rather in doubt. I believe there is considered by patent agents to be some difficulty in filing the documents in the form that they are registered in England.

3806. Where there is an efficient staff, as there is in England, and investigations are made by experts on such a question, we will say, as subject-matter, would you favour that being accepted so far as your Union is concerned?—I do not think we could, sir, for this reason—that a novelty, say, in the improvement of an engine might be patented in England when there may have been somebody here working out the idea at the same time, and it may, in fact, be in operation in South Africa, so that, therefore, it would not be patentable here.

3807. The attitude seems to create somewhat of a dilemma, does it not? You want to bring the Patent Laws of your Union as close as you can into conformity with those of the Mother Country, and you want freedom to investigate and decide for yourselves, seemingly, in many directions?—I think that is inevitable.

3808. **(Sir Alfred Bateman.)** You recognise that we in England not only have our own Patent Law, but that law is to some extent based on the Conventions which we have entered into with civilised countries in different parts of the world as regards important points in patents and trade marks under the Madrid Convention, so that we hope that you will gradually, as far as you can, come into line with the legislation of the Mother Country and eventually join those Conventions?—Well, sir, the tendency of the Bill, I understand, which is being reconsidered by the Law Department, is to get into uniformity with the English Act, except in the working conditions. We never could have those.

3809. Of course, in England, the patent is a lucrative source of Government revenue—there is a nice little profit attached to it, even, with the expense of searches; you could not have searches here—there is not the business?—Quite so; it is 600 applications against 30,000.

NAME INDEX.

ANDERSON, E., Chairman of the Natal Manufacturers' Association, question of extension of industries and creation of new markets 3503–3611

AUDAS, JOHN THOMAS, Head of the Administrative Brauch of the Mines Department, Natal :
Coal-mining, Natal 827–45, 855–9, 877–81, 916–27, 943–70
Copper 937–9
Gold 870, 933–6
Iron ores 868, 940–2
Mining, acquisition of title, claims, etc. ... 845–54
Taxation on profits of mining 844–5

BEKENN, WILLIAM, Manager of Fairleigh Colliery : p. 105
Collieries in Newcastle District ... ... p. 105
Fairleigh Colliery, position, labour, etc. ... p. 105

BENJAMIN, Advocate Louis Edmund, K.C., LL.B., Commercial law and uniformity question p. 178, 3743–3793

BOURKE, EDMUND FRANCIS, President of the Pretoria Chamber of Commerce, mineral products of Pretoria district ... ... p. 33

BRADLEY, J., & SONS, letter *re* china, earthenware, and glass trades ... ... p. 158

BUCHANAN, ALEXANDER, Chairman of the Durban Chamber of Commerce : 2737–2751, p. 162–3, 3445–82, 3491–2, p. 175–6
Arbitration awards and import of gunnies and rice from India ... ... p. 162–3, 3445–82, 3491–2
Commercial travellers' licences... ... ... p. 175–6
Weights and measures 2737–51

BUTCHER, WALTER, Vice-Chairman, Durban Chamber of Commerce : p. 127–8, p. 162–3, 3483–90, 3493–502
Arbitration awards and imports of gunnies and rice from India ... p. 162–3, 3483–90, 3493–502
Commercial travellers' licences... ... ... p. 175–7

CHAPPELL, ERNEST, J.P., representing the Johannesburg Chamber of Commerce : p. 124, 2801, 3736, 3799–800
Patent rights and trade marks... ... 3799–800
Statistics 2801
H.M. Trade Commissioner 3736

DUNLOP, ROBERT, Secretary, Pietermaritzburg Chamber of Commerce : ... ... p. 26, 770–824, 3657–719
Advantages of Pietermaritzburg for establishment of industries 3657–719
Empire trade mark 3716–7
Iron ores and coke ... ... p. 26, 770–824

DU TOIT, DR. ALEX. L., Geological Surveyor, Cape Province : 192–245
Coal 226
Copper ... ... p. 8, 205–6, 229–41
Dolomite 205
Imperial Institute 235–8
Iron ores ... ... p. 8, 195–204, 210–21, 242–5
Manganese 225–6
Minerals, Cape Province 208

DURBAN CHAMBER OF COMMERCE : Views *re* commercial travellers' licences ... ... p. 175–6

EHRLICH, W., J.P., Vice-President of Bloemfontein Chamber of Commerce : 3303–3443
Capital for industries and agriculture, possibilities of obtaining 3416–43
Suggestion *re* establishment of branches in South Africa by English manufacturers 3304–415

EGAN, W. J., Canadian Government Trade Commissioner : 3045–3154
Canadian trade with S. Africa, position and possibilities 3045–154
Panama Canal 3079–85, 3102–6
Trade Commissioners 3110–2, 3147–50

EVANS, MAURICE SMETHURST, C.M.G., gold mines, causes of deficiency of native labour 708–21

FORSYTH, DAVID FORBES, B.A., Chairman, Pietermaritzburg Chamber of Commerce : p. 26 ; 3657–720
Iron ores ... ... p. 26
Pietermaritzburg, advantages of, for establishment of industries 3657–720

FRAMES, PERCIVAL ROSS :
Managing Director of the Premier Diamond Mining Co. 984–1217
PREMIER DIAMOND MINES :
Financial particulars ... 986, 1126–8, 1188–92, 1195–9
Foundry 1117–21
Labour 988–96, 1010–59, 1067–97, 1122–5, 1129–38, 1141–9, 1154–87, 1198–211
Life of mine 986, 998–1003, 1108–16
Output, quality, quantity, etc. 986–8, 1102–15, 1194
Sale system 988, 1004–5, 1100–1
Water 988, 1212–7
Working method 988, 1060–4

FROOD, G. E. B., M.A., M I.M.M., Inspector of mines, Orange Free State : Orange Free State diamond and coal mines, conditions in, etc. 551–707

GEMMILL, WILLIAM, representing the Transvaal Chamber of Mines, mining : 1671–3, 1680, 1788, 1793–4, 1865–7, 1868–70 ; p. 117

GRIMMER, IRVINE ROWELL, Assistant General Manager of De Beers Consolidated Mines : 246–550
DE BEERS CONSOLIDATED MINES :
Explosive works 532–5
Financial matters, etc. 250–7, 366, 412–3, 362–5, 395, 397–9, 432–42, 479–80, 530–1, 542
Labour 260–1, 297–361, 363, 390–4, 418–25, 426–30, 447–78, 485–529, 496–500, 501–8, 538–50
Life 286–92, 376–9, 415–6, 481–3
Production, sale, market 262–74, 370–5, 380–8 408–11, 484, 536–7
Diamonds, demand 293–5, 400–7
German South-West Africa 275–85

HAARHOFF, IZAAK JACOB, J.P., oil shale p. 33

HANDS, GEORGE E., letter *re* commercial travellers' licences ... ... p. 176–7

HOLLAND, SIR REGINALD SOTHERN, His Majesty's Trade Commissioner in South Africa : 2807–2978
Agricultural statistics 2814–5
Agriculture and land banks 2852–63, 2894–6
Board of Trade Journal 2849–56
Colonial Institute, Commercial Intelligence Bureau 2837–42, 2956–66
Commercial travellers' licences... 2849
Enamelled ware 2843
Exhibition of samples 2842–3
Food and Drugs Act 2848
Local representation of British manufacturers 2833–6
Misrepresentation 2844–7, 2967
Population 2810–3
Public contracts 2833–6
Railway rates 2897–901
H.M. Trade Commissioner and Correspondents 2823–32, 2888–93, 2907–8, 2946–55, 2970–2, 2978
Trade conditions and British manufactures ... 2816–22, 2851, 2864–87, 2902–5, 2909–45, 2973–7

JAGGER, JOHN WILLIAM, M.L.A., President of the Cape Town Chamber of Commerce : ... 3794–6
British manufactures and South African trade 3030–1
Empire trade mark 3034–5, 3042–3044
Exhibitions 2685
Local industries and products, position ... 3038–41

Western, gold mines, labour less efficient in S. Africa, *Kotze* 1339

B.

Bacon industry, reason for want of development of, but possibilities, *Laite* 3239–40

Bankruptcy, question as to possibility of uniform code, *Benjamin*, p 178, 3778; *Mackeurtan*, p. 182.

Basutoland:
Mortality from disease of native labourers from, in Transvaal, 1913, *Pritchard* ... ... p. 93
Natives in excess of capacity of land, *Pim* ... 2182
Recruitment from, for work in mines, *Grimmer*, 420; *Williams*, 758–60; *Frames*, 990, 1033, 1141.

Bechuanaland:
Iron ore deposits, *see* Griqualand, West, and Bechuanaland *under* Iron Ores.
Mortality from disease of native labourers from, in Transvaal, 1913, *Pritchard* ... ... p. 93
Recruitment from, for De Beers mines, *Grimmer* 420

Beet Sugar, Natal:
no Extensive experiments, and question of reason, but possibilities, *Dunlop* 3711–4
Grows well, Pietermaritzburg district, *Forsyth*, *Dunlop*, p. 171

Belgium:
Competition in fencing material, *Holland* ... 2876–8
Import of coloured cotton blankets from, *Jagger* 3031

Bills of Lading and Charterparties, possibility of uniform code, *Mackeurtan* ... ... p. 182

Bills of Exchange, English law taken over to certain extent, *Benjamin* 3753, 3793

Blankets, sources of supply and possibilities of establishing factory at Pietermaritzburg, *Forsyth*, *Dunlop*, p. 171; 3659–62, 3695–7, 3701–9

Bloemfontein:
Negotiations with English carriage and wagon building firm formerly to establish works in, but failure, *Ehrlich*... ... ... 3305, 3368–71
Poor whites in, work, wages, etc., *Ehrlich* ...3390–415

Boake, E. J., evidence referred to, *Holland* ... 2848

Board of Trade, samples of foreign goods competing in Dominions, definite policy *re*, *Holland* ... 2842

Board of Trade Journal, reply to criticisms of, *Holland* 2958–9

Boot Trade, superiority of and largest demand for British manufactures, and extent of American competition, *Orr* 3257, 3263–4, 3296–9

Breadstuffs, imports from Canada, 1909–13, *Egan* 3057 *note*

British Empire Trade Mark, *see* Empire Trade Mark.

British Manufacturers' Representatives Association of South Africa, Incorporated :
Membership, *Solomon* 3156–8
Representative, *see* Solomon, J. ... 3155–3192

Brunner, Mond & Co., reference, *Dunlop* ... 801

C.

California, mining labour, unfavourable comparison of South Africa with, *Stallard* ... p. 119–120

Canada :
Exports to, total value, 1913, and articles, *Egan*, 3061–4, 3136–9
IMPORTS FROM :
Agricultural implements, increase and bigger increase anticipated, *Egan* 3153–4
Comparison of increase with increase of American trade, 1909–13, *Egan* 3125–9
Increase, and articles, *Egan* 3122–4, 3151–4
Possibilities of, *Egan* ... 3065, 3074, 3132, 3140
Preference, *Egan* 3100–1, 3130–1
Rates :
Comparison with rates from Boston and New York, *Egan* 3086–8
Satisfactory, and schedule issued by company, *Egan* 3119–21
Shipping service, *Egan* 3089–98
Timber, *Egan* 3104–6
Total value for some of principal articles, 1909–1913, *Egan* ... ... 3057 *note*
Value, 1909–1914, *Egan* 3069–70
total Value, 1913, and articles, *Egan* ... 3052–60
Wheat, increase anticipated, *Egan* 3140–1
Manufactures, production will soon be beyond consumption, *Egan* 3075–6
SHIPPING SERVICE :
Size of vessels, *Egan* 3142–3
Subsidy to Elder Dempster Line, *Egan* 3089–98, 3116–21
TRADE COMMISSIONER IN S. AFRICA :
Assistance as regards exports to Canada, *Egan* 3067–8
Date of appointment, *Egan* 3115
Trade correspondents, *Egan* 3113–4

Candle-making, local provision of raw materials, *Ehrlich* 3381–9

Cape Explosives Works, Ltd., *see under* Explosives.

Cape Province :
Coloured men in Western Province of Cape Colony, more and more becoming competitors with European, *Holland* 2934–40
Copper, *see that title.*
Dolomite, large areas, *du Toit* 205
Half castes, numbers and occupations, etc., *Pim*, p. 76, 2201–3
Manganese, *see that title.*
Mines and mining, *see that title.*
Mortality from disease of native labourers from, on mines and works in Transvaal, 1913, *Pritchard*, p. 93
Native labour from, for mines, 1904, 1913, *Pritchard*, 2575
Native territories, investigation by Mr. H. O. Buckle *re* native labour, *Pritchard* ... ... p. 94
Recruitment of native labour in, numbers employed in, etc., 1913, *Pritchard* 2499
Tin, *see that title.*
Transkeian territories, recruitment from, for De Beers mines, *Grimmer* 420

Carriages and motors, imports from Canada, 1909–13, *Egan* ... ...3057 *note*

Carriage and Wagon Building Firm, in England, negotiations with, by Government, formerly to establish works in Bloemfontein for supply of railways but failure of, *Ehrlich* 3305, 3368–71

Carriage Works, establishment of factories in South Africa suggested, *Ehrlich* 3323

Census, *see under* Statistics.

Cereal Foods, import from Canada, 1909–13, *Egan* 3057 *note*

China, earthenware and glass trades, position of British manufactures and extent of Continental competition ... ... p. 158

Coal :
Amount, estimate, *Kotze* 1363–6
Analyses made in South Africa, *du Toit* ... 226
Bulk bituminous, *Smyth* 174
Collieries, Orange Free State, *Frood* 556–60
Deposits, *Smyth* 46
only Exploited at present near railways, *Kotze* 1299–300
Export to oversea ports and use for bunkering, etc., possibilities, *Kotze* 1301
the Karroo, possibilities, *Lorimer* ... ... p. 118
KLIP RIVER DISTRICT :
Estimated amount, but only percentage good, *Steart* 928–32
Extent, etc., *Steart* 863–5
Number of collieries working, *Steart* ... 872
Low working costs and selling price, *Smyth* ... 118–9
NATAL MINES :
Accidents, and death-rate from, *Audas* ... 957–62
Acquisition of title, procedure, *Audas* ... 845–50
Analysis of coal at different parts, *Steart* ... 892–6
Area of coal of good quality limited, *Steart* 892–4
Average cost at pit head, *Steart* 884–5
Bunkering business could be increased with sufficient labour, *Steart* 908–9
Capital, debentures, etc., end of 1912, *Williams* p. 107
Coke :
Development of export trade not anticipated at present, *Steart* 974–8
Development of industry and use of, instead of imported coke, question of, *Dunlop* ... 780–99, 800–7, 813–9.
Little made, *Williams* 766
Manufacture etc. and question of use for foundry purposes, *Dunlop* 780–99, 800–7
Ovens, *Steart* 896–7
Production, 1913, *Dunlop* 815
Combination of coalowners, particulars *re*, and results, *Audas* 877–8
Demand for :
from the East, increasing, *Audas* 964
in Excess of output, at end of 1913, *Audas* 836–7
Increase probable, *Audas* 838, 840–1
Development probable, *Audas* 963
Dividends :
1910–12 and 1913, *Williams* ... ... p. 108
not very High, *Steart* 915
Establishment of colliery on farm, payment of compensation, *Audas* 851–2
Export trade, development anticipated, railway rates favourable, *Steart* 974–5
Export and output, steady increase since war, *Audas* 916–9
Extension, competition with United Kingdom would result, *Williams* 734–8
Extent, *Williams* ... ... p. 106
Faults and dykes, *Steart* 888
Four licences only, issued to one person for a farm, *Audas* 852–4
History, *Williams* ... ... p. 106
Inspection of mines, *Audas* 956
for Internal use, small increase likely, *Steart* 839–40
Klip River District, *see that title above.*
Labour :
Accommodation, *Williams* 724–7
Average wages per shift, *Pritchard* ... p. 92
Difficulty, *Steart* 905, 908
Indian :
Comparison with native, *Williams* p. 107 ; 761
Conditions of employment, *Williams* ... p. 107
Food, *Williams* ... ... p. 107
Medical and hospital fees paid by collieries, *Williams* ... ... p. 107
Numbers decreasing and reasons, *Williams* p. 107
Rates of pay, *Williams* ... ... p. 107
Recruitment costs, *Williams* ... ... p. 107
Natives :
Contracts, periods of, *Williams* ... 723, 725
Costs of (pay, food, hospitals, medicines), *Williams* ... ... p. 107
Desertions and more effective pass system desired, *Williams* ... ... p. 107
Difficulty in securing adequate supply increasing, *Williams* ... ... p. 107

Coal—*cont.*
NATAL MINES—*cont.*
Labour—*cont.*
Natives—*cont.*
not very Efficient for first three months, *Williams* 728
Food, *Williams* ... ... p. 107
Increase, extent of increased output that would result, *Williams* 741–2
Pay, rates of, *Williams* ... ... p. 107
Recruitment:
Method and sources, *Pritchard* ... 2507–13
Method and costs, and shortage due to competition of Transvaal gold mines, *Williams* 743–53, p. 107
in Transvaal prohibited, but gold mines can recruit in Natal, and restriction of recruiting area for Transvaal hoped for, *Williams* 753–60
might Remain longer if adequate housing accommodation for married men, but capital expenditure question, *Williams* 725–6
Short contracts, proportion are re engagements, *Williams* 729–30
Nature of, *Audas* 879
Number of whites, Asiatics and natives, 1912, 1913, and at present, and shortage, *Williams*, 722, 731–3, p. 106, p. 106–7
Shifts and hours, *Audas*, 881; *Steart*, 882–3; *Williams*, 739–40.
Wages and cost increasing, *Williams* ... p. 106
Wages of native and Asiatic, not increased, *Audas* 880
Large proportion not suitable for market, *Williams* p. 106
Leases with farmers for large areas, practice of, *Audas* 852
Major part of land reserved by Government in early days although law not put into force, *Audas* 852
Mining methods, *Steart* 965–6
Newcastle district, *see that title below.*
Old leases entered into between miners and private owners still in existence, *Audas* 852
Output:
1889, 1898, 1913, *Audas* 827–9
1910–1913, *Williams* ... ... p. 106
Average monthly output, 1912, 1913, *Williams* p. 106
Increase will result from industrial expansion, *Williams* ... ... p. 106
Steady increase, *Steart* 907
Price:
Effect of combine, *Audas* 877–8
Satisfactory at end of 1913, *Audas* ... 836–7
Profits distributed to shareholders not satisfactory with some exceptions, *Williams* ... ... p. 108
Prospects good for some few years, *Steart*... 902–4
Quality, and comparison with Welsh and Transvaal coal, *Smyth*, 70–2; *Audas*, 842–3, 920–5, 950–1; *Steart*, 971–3.
Resources, *Smyth* 92
Returns made by coal owners, *Audas* ... 858
Rights not reserved to Government in some old titles, *Audas* 848
Smalls, considerable tonnage of, no market for dross or duff coal, *Williams* 768–9
Soft coal, little trouble with, *Steart* ... 886–7
Storage bins at collieries, *Steart* 898
Strike. *Audas* 880, 900–1
Sulphur:
Extent of, *Audas* 943–9
Proportion of sulphur coal decreased, *Williams* 762–7
Supply to Admiralty not known, of, *Steart* 899
Taxation of profits and scale, *Audas*, 844–5; *Steart*, 913–4.
Timbering, *Steart* 889–90
Trucks, shortage of, and consequent difficulty, *Steart* 910–2
Value at pit's mouth compared with Cape coal, reason, *Kotze* 1390
Value and selling price, *Audas* 830–2
Ventilation good, *Audas* 967
Washing, *Audas* 921–2
Waste of, by reckless working, *Smyth*, 92, 142–3; *Steart*, 968–9; *Audas*, 969–70.
Waste, largely duff, but use of, now by power companies, *Kotze* 1,389
Worked under general mining laws, *Audas* 952–5

Coal—*cont.*
Natal and Zululand, estimated resources, *Steart* 862 *note*
Nationalisation of mines advocated, *Matthews* 2075
NEWCASTLE DISTRICT:
Better than Transvaal coal and large supply, *Malcolm* p. 104
Collieries in district, *Bekenn*... ... ... p. 105
Fairleigh Colliery:
Capital, *Logan* ... ... p. 105
Coal used principally for railway purposes, *Logan* p. 105
Depth, *Bekenn* ... ... p. 105
Labour supply, hours, wages and health, *Bekenn* p. 105
Price of coal at pit's mouth, *Logan* ... p. 105
Resources, quality, etc., *Logan* ... ... p. 105
Successful position, *Bekenn* ... ... p. 105
Mines scientifically worked, but coal extravagantly destroyed, which should be stopped by law, *Malcolm* ... ... p. 104
Profitable nature of industry, *Malcolm* ... p. 104
Quality and comparison with Welsh, *Malcolm* p. 104; p. 104–5; *Logan* p. 105.
Resources, *Malcolm* ... ... p. 104
Two collieries, *Malcolm* ... ... p. 104
Used for railway consumption and shipping, *Malcolm* p 105
ORANGE RIVER FREE STATE:
Areas not yet thoroughly prospected, but of enormous dimensions, *Frood* 620–2
Depth, *Frood* 607A
Government inspection, *Frood* 595–604
Market, *Frood* 561–2, 627
Output:
1913, *Frood*... 556–7
Increasing and increase likely to continue, *Frood* 558 623
Pneumonia and other diseases, *Frood* ... 692–8
Quality and value, *Frood* 562–3, 625–6
Recruitment system, *Frood* 590–2
Vereeniging centre, *Frood* 559–60
Wages system, *Frood* 681
Port Elizabeth district, indications found, but trial borings disappointing, *Lorimer* ... ... p. 118
Production from different provinces, 1912, value and tonnage, *Smyth* 12, 120
Renting of areas, systems, *Smyth* 175–6
Resources, publications handed in, giving estimate, *Kotze* 1231–2
TRANSVAAL:
Comparison with Natal, *Smyth* 70–2; *Audas* 950–1; *Malcolm* p. 104.
Native labourers, average numbers, Feb. 1914, numbers from Portuguese East Africa and British South Africa, *Pritchard* ... ... p. 94
Witbank, comparison with Natal, *Audas* ... 950
Worst paid and least popular form of mining employment among native labourers, *Pritchard* p. 94

Colonial Institute Commercial Intelligence Bureau, criticism of establishment of, as a duplication of work of Board of Trade, and likely to lead to confusion, *Holland* 2837–41, 2956–7

Commerce and Industries, Minister of, *see under* Trade.

Commercial law:
CODIFICATION:
by Central authority, advocated, *Benjamin*, p. 178, 3743, 3754–6
Drawbacks *Mackeurtan* ... ... p. 182
Possibility, *Benjamin*, p. 178; 3747, 3757–9, 3769–73, 3780–1
Procedure, proposal *re*, *Benjamin*, 3743–8, 3763–7 3782–93
Copyright and trade mark laws taken over from England, *Benjamin* 3786
Differences between English and Roman Dutch law, particulars, *Mackeurtan*, p. 182–3; *Benjamin*, p. 178, 3,760–2.
Distinctions between Roman Dutch law as interpreted in various Provinces, *Mackeurtan* ... ... p. 183
Position of, *Benjamin* ... ...p. 178; 3748–93
Prerogative of Union Parliament to make commercial laws for whole of Union, *Benjamin* ... 3774
UNIFORMITY:
Advisable, but difficulties, *Mackeurtan* ... p. 181–2
Agreement desired in many directions by Johannesburg Chamber of Commerce ... ... p. 183

Commercial Law—*cont.*
UNIFORMITY—*cont.*
Importance of, and advantages to be derived, *Benjamin* ... ... p. 178 ; 3754–6, 3779
Inconveniences from present lack of, *Benjamin* 3749–53
Commercial travellers, *see under* Trade.

Company law :
Natal, more stringent law desirable, *Mackeurtan* p. 182
UNIFORMITY :
Lack of, *Benjamin* ... ... p. 178 ; 3775–7
Possibility, *Mackeurtan* ... ... p. 182
Uniformity or agreement desired in many directions by Johannesburg Chamber of Commerce ... p. 183

Copper :
Areas, *Smyth* 12–5
CAPE PROVINCE :
Cape Copper Company's and Namaqualand mine, output, 1912, *Smyth* 33–8
Deposits not large and lenses getting smaller in depth, etc., *Smyth* 39–41
Deposits and prospects, *du Toit* p. 8 ; 205–6, 234–41
Discovery of copper and nickel in rock form, *du Toit* p. 8 ; 229–33
Export, decrease, explanation, *Holland* ... 2883–4
Gold or silver in, practically none, *Smyth* ... 36
MESSINA MINE, PRETORIA DISTRICT :
Form in which copper sold, *Kotze* 1376–7
Output, quantity and value, 1912, 1913, January and February, 1914, *Bourke* ... ... p. 33
Production, *Kotze* 1373–5
Messina mine and adjoining mine, possibilities of, *Bourke* 980
Names of producing mines, *Kotze* 1372
Natal, deposits, nature of, etc., but little developed, *Audas* 937–9
Nationalisation of mines advocated, *Matthews* 2075
PRODUCTION :
1912, and production from Cape and Transvaal, *Smyth* 12–5
Increasing, *Holland* 2883
Cotton, competition with the East in Manchester, not anticipated, *Anderson* ; *Reynolds-Tait* ... 3556–7

Customs :
Convention, particulars *re*, *Laite* ... ... p. 152
PREFERENCE ON BRITISH GOODS :
Conditions, *Lewis* 2694–6, 2723–5
does not Cope with high duties, *Solomon* ... 3181
Obtaining of, by goods from other countries, no complaints heard, *Lewis* 2719–22

D.

Dairying Industry :
Co-operation, *Laite* 3245
Lack of development due to lack of proper railway cold-storage facilities, and manufacture being left in hands of small farmers, *Laite* 3242–4
De Beers Consolidated Company, *see under* Diamonds.

Diamonds :
Area of, and class of diamonds produced, *Smyth* 12
Combination of great producers for control of market would be approved, *Frames* 1005–9
DE BEERS CONSOLIDATED COMPANY :
Accidents reported to Government and inquiries held, *Grimmer* 474–8
Benefit Society, system, *Grimmer* 485–92
Blasting operations, everything possible done to minimise accidents to workers from, *Grimmer* 452–3
Capital, dividends, etc., *Grimmer* 250–7
Competition from German South West Africa in certain classes only, *Grimmer* 282
no Co-operation or arrangement with other companies and none known to have been contemplated, *Grimmer* 366, 395
Deposits almost unlimited in life, *Kotze* ... 1302
Depth :
Impoverishment in, *Kotze* 1303–5
at Present and possibilities, *Grimmer* ... 380–8
no special Disease, etc., accruing from work, *Grimmer* 450, 462–3
Dividends, 1912–13, amounts paid in South Africa and in London, *Grimmer* ... ... 436, *note*

Diamonds—*cont.*
DE BEERS CONSOLIDATED COMPANY—*cont.*
Equipment, no expense spared to perfect, *Grimmer* 285
Explosive works, proportion of output used on mines, and market for remainder, *Grimmer* ... 532–5
Formation, 1888, by purchase of other companies in Kimberley, *Grimmer* 247–50
Government inspection of mines, *Grimmer* 475–6
Hospitals, average proportion in, *Grimmer* 522–3
Income tax paid formerly in United Kingdom but Managing Committee in London given up to avoid, *Grimmer*, 479–80.
Investments, *Grimmer* 542
Labour :
Age of workers, *Grimmer* 454–9
Average number of natives, coloured persons and convicts employed, 1913, *Pritchard* ... p. 93
Compensation for accidents, etc., *Grimmer* 424–5
Convicts, hiring of, from Government, work of, etc., *Grimmer* 363, 426–30, 501–4
Medical treatment, *Grimmer* 524–5
Natives :
Death rate per 1,000 from diseases and accidents, 1907–13, *Grimmer* ... ... 449 *note*
Estimated sum spent by, on food per day *Pritchard* 2494
Good treatment of, *Frames* 991
Home remittances, *Grimmer*, 351–3 ; *Pritchard*, p. 93.
Hours, *Grimmer* 544–7
Liquor cannot be obtained by, *Grimmer* 334–5
Periods of service, and many boys return, *Grimmer* 318–21
Popularity of employment, *Pritchard* 2506
Prevented by custom from doing same work as whites, *Villiers* 1611–4
Railway fares, arrangement, *Grimmer* 346, 509–16
Recruitment :
no Difficulty in securing, reasons, *Pritchard*, p. 93
Method, *Grimmer* 345–50
Total cost, 1913, *Pritchard* ... ... p. 93
Sale of stores to, in compounds and average sum spent per native per diem, *Grimmer*, 328–33 ; *Pritchard*, p. 93.
Segregation system and strictness of, *Grimmer* 316–8, 520–1
Theft by, precautions taken against, *Grimmer* 336–7
Wages :
Average, per shift, *Pritchard* ... ... p. 93
no Fixed limit, and 5*s.* or 6*s.* a day can be earned, *Evans* 716
Natives apparently satisfied, *Grimmer* 471–3
Rates and system, *Grimmer*, 323–8, 496–500, 505–8, 541, *note.*
no Upward tendency, *Grimmer* ... 465–70
Native locations, if natives spread out outside town health would be better, *Kotze* 1418–21
Number of whites and natives, *Grimmer* ... 260–1
Percentages paid to men on diamonds picked up in course of work, *Grimmer* 321–2
Policy as regards treatment of men, *Grimmer* 390
Sale of stores to, use of profits for benefit of natives and public institutions, *Grimmer* 424–5
Shifts, *Grimmer* 548
Sources of, *Grimmer* 419–22
Stability, probable reasons, *Grimmer* ... 390–4
White :
Applications, number, *Grimmer* ... 300–1
Apprentice system, *Grimmer* ... 354–61, 526–9
Average age of members of Benefit Society, April 1, 1913, *Grimmer* ... ... 454 *note*
Dismissal, right of, *Grimmer* 313–5
Hours, *Grimmer* 544–7
Housing arrangements, *Grimmer* ... 493–5
Membership of Benefit Society, deaths and causes of, 1904–13, *Grimmer* ... ... 311 *note*
Nationalities, *Grimmer* 550
Number of natives under one white, *Grimmer* 340–4
Numbers in different departments, *Grimmer* 550
Periods of service and wastage very small, *Grimmer* 297–9
Supervising work only, *Grimmer* ... 418
no System of searching, as honesty and good pay trusted to, *Grimmer* 337–9

Diamonds—*cont.*
De Beers Consolidated Company—*cont.*
Labour—*cont.*
White—*cont.*
Wages :
Increases, *Grimmer* 538–41
Payment of flat rate instead of contract system and bonus in certain cases, *Grimmer* 302–9
Rates for different classes of work, *Grimmer* 541 *note*
in Workshops, *Grimmer* 517–9
Large numbers of persons indirectly supported, *Grimmer* 447
probable Life of mines, *Grimmer* 286–92, 376–9, 415–6, 481–3
Machinery, import of practically all, from England, *Grimmer* 443–5
Mines of, *Grimmer* 258–9
Number of mines working, *Grimmer* ... 549–50
Price of diamonds, greater than that of Premier diamonds owing to difference in quality, *Grimmer* 398–9
Production :
Cost of, question of ratio to market value, *Grimmer* 408–11
Daily, *Grimmer* 262–3
Increase, possibilities of, without decreasing value, *Grimmer* 371–5
Proportion to production of S. Africa and the world, *Grimmer* 267–70
Proportion to total production must be decreasing, *Grimmer* 379
Restriction of, to suit market, but other companies less ready to restrict, *Grimmer* ... 271–2, 371
high Profits, *Kotze* 1305
Restriction of amount of stones put on the market by, *Smyth* 112
Sale and market, *Grimmer* 273–4
Sales, 1913, *Grimmer* 264–6
Shareholders, question of proportion living in Mother Country and other parts of the empire, *Grimmer* 432–42
Temperature, *Grimmer* 382
Total contribution to revenue of the country and details, *Grimmer* 362–5, 530–1
Value decreasing with depth, *Grimmer* 484, 536–7
Ventilation, *Grimmer* 387
Demand for :
Fluctuations, *Grimmer* 400–7
Increasing throughout the world up to now, and likely to continue, *Grimmer* 293–5
Deposits, question as to possibility of finding further, *Grimmer* 389
Exhaustion, no symptoms of, *Smyth* 141
German South-West Africa :
Class of, and where found, *Grimmer* ... 275–85
Competition with De Beers in certain classes only, *Grimmer* 282
Control of output, *Smyth* 112
Government proportion of profits :
Concealment of pipes owing to, not known of, *Grimmer* 414
Transvaal, O.F.S. and Cape, *Grimmer* ... 412–3
Jagersfontein, Orange Free State :
Compound system, *Frood* ... 647–52, 699–705
Covered ways from mine to compound and change houses, *Frood* 655–7
Depths, *Frood* 605–7
Labour :
no Access to drink, and consequent popularity, *Frood* 706–7
Natives :
Rationing of, and advantages of, *Frood* 569–78
Wages, *Frood* 569–70, 645–6
Numbers of whites and natives, *Frood* ... 567
Supply adequate, *Frood* 568
Mortality among whites less than among natives, *Frood* 584
Mortality from accidents and disease, *Frood* 579–86, 612–7, 643–4, 682–5
Pneumonia, prevalence of, difficulty of dealing with, etc., *Frood* ... 581–6, 635–40, 653–80, 686–93
Production, 1913, *Frood* 565
Ventilation, improvement of system, *Frood* 674–6
Labour, Native :
Average wages per shift, *Pritchard* ... p. 92
Easier to get, than in gold mines and question of reason, *Frames* 990–1

Diamonds—*cont.*
Orange Free State :
Alluvial diggings, *Frood* 632–4
further Deposits, possibility of finding, *Frood* 629–31
Government inspection, *Frood* 595–604
Labour :
no Difficulty in obtaining, and small sums spent on recruiting, *Frood* 587–9
Native :
Payment of flat rate, seems to work well and no objection seen, *Frood* 593–4
Rationing of, by companies, advantage of, *Frood* 571–7, 608–11
Medical examination, *Frood* ... 640–2, 661–8, 688–92
Number of mines, *Frood* 553–4
Production, 1913, *Frood* 564
Shutting down of mines, *Smyth* 74
Output, 1912, *Smyth* 12
Premier Diamond Mining Co. :
Capital and dividends, *Frames* 986
Contribution to revenue of Government, details, *Frames* 996, 1098–9, 1126–8
Deposits almost unlimited in life, *Kotze* ... 1302
Expenditure out of profits, *Frames* ... 986
Farms and houses round mine, ownership, *Frames* 1065–9
Foundry, price of Durham coke, *Frames* ... 1117–21
Greatest depth at which working would be possible, *Frames* 1112–5
Hawkers outside mine, *Frames* 1041–2
Illicit diamond buying, extent of, and reason for small amount, *Frames* 1041–3
Impoverishment in depth, *Kotze* 1303–5
Income tax paid to British Government, *Frames* 1192
Labour :
Accidents, fatal or not, enquiry held, *Frames* 1179–80
Contract with men who do actual work, not with supervisors, *Frames* 1016–8
Death from disease, no inquest held, *Frames* 1179–81
Native :
Average age, *Frames* 1165–7
Average number employed, 1913, *Pritchard* p. 93
Average period of service, *Frames* ... 991
Closed compound system, *Frames* ... 990–1
Compound stores, average sum spent per native per diem in, *Pritchard* ... ... p. 93
Death rate from accident or disease, 1909–1913, *Frames* ... ... 994–5, 996 *note*
Death rate, decrease hoped for, *Frames* 1145–6
Death owing to accident, compensation paid, *Frames* 1185–7
Difference in class of labour of various tribes, *Frames* 1141
little Difficulty in securing, compared with gold mines, and reasons, *Pritchard* ... p. 93
no Difficulty and no shortage now, *Frames* 1034–6
Efficiency and health at end of six and twelve months compared, *Frames* 1198–202
Efficiency, improvement year by year, *Frames* 1028–31, 1168–74
Estimated sum spent by, on food per day, *Pritchard* 2494
Feed themselves and advantages and success, *Frames* 990, 991, 1080–2
Home remittances made by, or on behalf of, 1913, *Pritchard* ... ... 2525–8, p. 93
Hours, *Frames* 990
Illicit drink traffic, cases occasionally, but easily controlled, *Frames* 1040
Inoculation for smallpox and pneumonia on arrival, *Frames* 1204
Medical examination, no regular system, *Frames* 1182–4
Number, *Frames* 990
Pneumonia :
Connection with bunks, *Frames* ... 996
Inoculation as suggested by Dr. Almroth Wright, and decrease believed to be due to, *Frames* ... 994, 1044–59, 1087–97, 1129–30
Popularity of employment, *Pritchard* ... 2506
Recruitment :
Method and sources and cost, *Pritchard*, p. 93 ; *Frames*, 990, 1019–27, 1032–3, 1085–6.
Number recruited and number of voluntary natives, 1913, *Pritchard* ... ... p. 93

Diamonds—*cont.*
PREMIER DIAMOND MINING CO.—*cont.*
Labour—*cont.*
Native—*cont.*
Returned, death-rate better than in case of new boys, and health benefitted by, *Frames* 1175–8
Returns to service after having left, *Frames* 991
Sale of stores to, system, *Frames* ... 991
Tuberculosis, increase, *Frames*... ... 1205–11
Wages :
Average, paid by shift, *Pritchard* ... p. 93
Explanation of variations, *Frames* ... 1076–9
Rates and comparison with wages on the Rand, *Frames* 1134–8
Rates and system, *Frames* ... 990, 1142–4
Wine not supplied to, but Kaffir beer given, *Frames* 1161–4
Typhoid fever epidemic, January, 1914, *Frames* 1203
White :
Average period of service and length of, and reasons, *Frames* 991, 1010–8
Classification according to length of service, 1902–13, *Frames* 991
Co-operative stores, *Frames* 989–90
Co-partnership system discussed, but adoption not considered desirable, *Frames* ... 1154–60
Death-rate from accident or disease, 1909–13, *Frames* 991–4
Earnings, *Frames* 988
no Enquiries made *re* character, etc., before engagement, *Frames* 1011
Hours, *Frames* 988
Housing arrangements, *Frames* ... 1067–9
Nature of work, *Frames* 990
Number, *Frames* 988
Pension fund, particulars *re*, *Frames* 990, 1070–5
Privileges, benefit society, compensation, etc., *Frames* 989, 990
Promotion system, *Frames* 989, 1131–3, 1150–3
Sons, apprenticeship to ordinary trades, and technical education under consideration, *Frames* 1122–5
Strike, *Frames* 990, 1011
Wages, system, *Frames*... ... 989, 1083–4
Life, practically eternity, *Frames* 986, 998–1003, 1108–16
Nature of mine, *Frames* 986
Price of diamonds :
Decrease, *Frames* 1194
Price of De Beers diamonds greater owing to difference in quality, *Grimmer* ... 398–9
Production :
1913, *Frames* 986–8
Coincidence with condition of the market, *Frames* 1102
Decrease, *Frames* 1102, 1105–6
Decrease in number of carats to the load, *Frames* 1194
Total, to 31st October, 1913, *Frames* ... 986
Profit fairly reasonable, but essential for price to remain above certain level, *Kotze* ... 1305–7
Profitable from first day, *Frames* 1103
Sale of diamonds, method, *Frames*... ... 1100–1
Sale system, *Frames* 988, 1004–5
Shareholders, question as to countries of, *Frames* 1188–92
Started, 1902, *Frames* 986
Taxation, not based on life of mine, *Frames* 1195–7
Water power and water supply, *Frames* 988, 1212–7
Working method, *Frames* 988, 1060–4
Price, factors, *Smyth* 75
Price at which mining payable, *Smyth* ... 73–4
PRODUCTION :
in Different areas, 1912, *Smyth* 12
since First discovery, *Grimmer* 296
Non-restriction, market must be affected, *Grimmer* 397
Restriction of, arrangement between Premier Mine and De Beers talked about, but no arrangement known, *Smyth* 109–12
River mining, *Smyth* 12, 113–7
TAXATION OF PROFITS OF MINING :
Rate, *Audas* ... ... 845 *note*
Taking of 60 per cent. of profits by Government in Transvaal, question of effect, *Smyth* ... 103–8
Director of Native Labour, evidence *re* savings by natives before Mr. Buckle ... ... p. 112
Dolomite, Cape Province, large areas, *du Toit* ... 205
Double Income Tax and Death Duties, objection to, by Johannesburg Chamber of Commerce ... p. 183
Drapery, Clothing, and Fancy Goods :
British manufactures coming to the fore and manufacturers showing greater desire to meet wishes of customers, *Orr* 2291–2
English goods would in many cases get preference owing to sentiment if price and quality about equal, *Orr* 3293–5
German, etc., competition in certain lines and question of British manufacturers capturing trade, *Orr* 3267–9, 3272–88
Goods bought by people irrespective of where made, *Orr* 3267, 3270–1
Imports, proportions of British and foreign manufacture, *Orr* 3252–6, 3258–62
Preference on British goods, *Orr* 3265–6
Drugs and Chemicals, increase in imports, *Holland* 2819–20
Durban :
Advantages of, for establishment of industries, and need for creation of fresh markets, *Anderson, Reynolds-Tait* ... ... p. 165 ; 3504–611
Electrical power, *Anderson*, 3564–6, 3602–4, 3605–6 ; *Reynolds-Tait*, 3566–7, 3604.
Exports, excess over imports, *Reynolds-Tait* 3533, 3540
Growth of, as manufacturing centre, *Anderson, Reynolds-Tait* ... ... p. 165 ; 3505–6
WHOLESALE SOFT GOODS TRADE :
Importance of, *Hands* ... ... p. 176
Number of employees and persons indirectly dependent on, *Hands* ... ... p. 176

E.

Earthenware and Glassware, exhibition of samples of foreign goods, *Holland* 2842
Education, *see under* Natives *and under* Whites.
Electrical Machinery, British, improvements and British firms now holding their own, *Holland* ... 2872–3
Electrical Material, increase in import, 1910, 1911, explanation, *Holland* 2817–8, 2866
Empire Trade Mark :
Adoption favoured by Pietermaritzburg Chamber of Commerce, p. 171 ; *Dunlop* 3716–7
not Considered to any extent by Cape Town Chamber of Commerce, *Jagger* 3044
great Expansion of British markets not anticipated as result, *Jagger* 3035
Mark should indicate actual country and Colony of manufacture, p. 173 ; *Soutter*, p. 174 ... 3729–33
would be more Useful in regard to foreign and continental and S. American countries than to S. Africa, *Jagger* 3034, 3044
Enamelled Ware :
Allegations *re* description of British-made as foreign-made, reply, etc., *Holland* 2843
British, favourable comparison with foreign, *Holland* 2843
British made, good prospects, *Holland* ... 2843
British manufacture throughout, *Holland* ... 2843
Late delivery, explanation of, but no trouble now, *Holland* 2843
Engineering, etc., trades, little progress and reasons, *Laite* ... ... p. 153–4
Exhibitions, *see under* Trade.
Explosives :
CAPE EXPLOSIVES WORKS, LTD. :
Competition of Nobel Trust, *Quinan* ... 2989–94
Number of persons employed, *Quinan* ... 3011
Representations made to Union Government to have explosives put on list of preferential articles but without success, *Quinan* 3019–20
Shipments to Australia, 1908–1913, and duty paid on, *Quinan*, p. 144 2980–3
Trade with Australia and claim to abolition of 5 per cent. *ad valorem* customs duty, *Quinan*, p. 143–4 2980–3018
Combination of manufacturers, *Quinan*, p. 144, 2992–4
Export to Australia from De Beers works, *Grimmer* 535
Exports, *see under* Trade.

F.

Factories, *see under* Trade.

Fairleigh Colliery, *see under* Newcastle district *under* Coal.

Far East, possibility of developing trade to, question of cheap freights etc., *Anderson*, *Reynolds-Tait*, p. 165, 3509–15.

Federated Commercial Travellers' Associations of South Africa, letter ... ... p. 177

Fencing material, Belgian competition, *Holland* 2876–8

Fire bricks, etc., possibilities at Pietermaritzburg, *Forsyth*, *Dunlop* ... ... p. 171

Flour, milling, increase, *Holland* 2929

Food and Drugs Act, possibility of Trade Commissioners assisting British exporters in connection with, *Holland* 2848

Fruit:
- Complaint by Mr. Pickstone *re* lack of information *re* fluctuations in English prices of fruit, reply to, *Holland* 2849–50
- Import from Canada, 1909–13, *Egan* ... ...3057 *note*

Fruit canning, jam and preserve making, Pietermaritzburg. possibilities, *Taylor*, 3640, 3644; *Forsyth*, *Dunlop*, p. 171, 3684–6, 3718–20.

G.

General Mining and Finance Corporation:
- Position of, as regards mines, *Nathan* 2639–41
- Representative, *see* Nathan, G. 2589, 2622

German South West Africa:
- Diamonds, *see that title*.
- Mortality from disease of native labourers from, in mines and works in Transvaal, 1913, *Pritchard*, p. 93.

Germany, machinery from, competition of, *Holland* 2914–9

Gold Mines:
- Accidents, statistics, 1912, *Shanks* ... ... p. 110
- Administration, particulars and drawbacks of system, *Nathan* ... ... p. 99, 2598–602
- AMALGAMATION:
  - Advantages, that employment of more white labour made possible, *Wybergh* 2117
  - of All existing companies:
    - Advantages to be derived by, and disadvantages of present system, *Nathan* ... ... 2633–8, 2644, p. 99–101, 2589A–602, 2613–26, p. 116
    - Arguments brought forward in favour of, three years ago, *Schumacher* ... ... p. 82–3
    - would Benefit shareholders, and probably ultimately all parties concerned, *Neuhaus* 1795–6
    - wide Consideration needed, *Neuhaus* ... 1800–1 1810–1
    - Contentment of white workers as result, question of, *Schumacher* 2458–64
    - Desirable theoretically but obstacles seen, *Schumacher* ... p. 83, 2279–83, 2347–9, 2366
    - Engineering difficulties would be overcome by, *Way* 1798–800
    - Financial savings anticipated, details of, *Nathan* p. 116
    - Government might want to take over, *Schumacher* 2364–5, 2434–6
    - Number of white men employed would be increased, *Nathan* ... ... p. 101
    - Production would be regularised, but question of throwing men out of employment, *Neuhaus* 1803–11
    - Results, question of, *Schumacher* 2349–66, 2383–93, 2428–36
    - Salaries, doubt whether saving would be great, *Schumacher* 2359
    - Taking over of mines by State, question of, *Nathan* 2666–71
    - 25 per cent. of profits after shareholders have secured 7 per cent. dividends should be retained for development of country, *Nathan* ... 2627–32, p. 101.
    - White workers' attitude, question of, *Nathan* 2679–82
  - Conducive of good results and question as to benefit of further, *Kotze* 1438–45
  - Further, possible from time to time, *Schumacher* 2454–5
  - Further, probable, but not to same extent, *Kotze* 1252–4
  - Profitable, and question of, in future, *Neuhaus* 1650–3
  - Results hitherto satisfactory on the whole, *Schumacher* 2309, 2452–3
  - Successful, *Neuhaus* 1773
- Average cost per ton and average value, *Kotze* 1485–6
- Burdens borne by industry ... ... p. 109
- CAPITAL:
  - Amount of cash paid up, *Neuhaus* 1726–8
  - Provision out of mines, possibility of, *Wybergh* 2116, 2123
- Capital expenditure, amortization before payment of profits tax, *Neuhaus* 1725
- Claim licences, system, *Smyth* 97–9
- Closing down of mines, *Smyth* 25
- Costs of mining, lower in Western Australia, reasons, *Kotze* 1335–8
- Crown mines, increase in production with same number of Natives, *Schumacher*, p. 83, 2295; *Nathan*, 2592.
- DEPTH:
  - Greatest at present, *Way* 1707
  - Greatest depth at which working would be payable, *Way*, 1702–4, 1715; *Smyth*, 29.
  - Increase, work does not increase in hardness, *Neuhaus* 1733–4
  - Slightly poorer grade the deeper the mine, *Smyth* 27–8, 30–1
- Dividends, total, up to end of 1913 and during 1913, *Neuhaus* 1630–2
- main Importance of industry as means of attracting population and providing homes and work for people, not as field for investment of capital, *Wybergh*, 2115–6, 2123–9.
- Knight's Deep Mine, working costs, *Smyth*, 18–21; *Kotze*, 1336.
- LABOUR:
  - Advantages of general amalgamation to, *Nathan* p. 101, 2650–65
  - Competency of, for skilled work, *Pim* ... 148
  - Competition for, and disadvantages, *Nathan* p. 100
  - Cost, proportion to total working costs, *Neuhaus* 1718
  - Efficiency, increase, 1904–1913, *Kotze* ... 1245–7
  - less Efficient than in Western Australia, *Kotze*, 1339
  - Employment common to both coloured and white workers, *Smyth* 165–8
  - Large proportion South African born, or permanently settled in country, *Wybergh* 2115
  - Native:
    - Allotment to mines, *Schumacher* 2337–41
    - Capacity of, and comparison with white, *Smyth* 133–40
    - Closed compound system:
      - considered the Best system by everybody, but difficulty of storekeepers' vested interests, *Schumacher* 2325–8
      - Difficulties of carrying out, as at Kimberley, *Villiers* 1532
      - Impracticability, *Neuhaus*, 1668–70, 1673–8; *Pritchard*, p. 94, 2504–5.
    - not Comparable with native labour elsewhere, *Schumacher* 2293–4
    - Competition for, *Nathan* ... ... p. 115–6
    - Contract system:
      - Advantages, *Pritchard* 2483
      - in Force for hammer work for many years, *Neuhaus* 1743–4
    - Cost per day of feeding, *Pritchard* ... 2494
    - Deficiency of, explanation, *Evans* ... 708–21
    - Economical as compared with white and must continue, *Way* 1757–60
    - Efficiency:
      - Increase, *Kotze*, 1282–3, 1445–50; *Way*, 1698; *Pritchard*, 2483–9; *Schumacher*, 2456–7.
      - will Increase if more scope and opportunities given, *Kotze*, 1275–7; *Neuhaus*, 1662–3; *Pritchard*, 2483–9; *Nathan*, 2605–9.
    - Foodstuffs and goods bought from stores outside, rations provided, *Pritchard* 2495
    - Hammer and machine shifts, number, December, 1913, *Schumacher* 2304
    - Illicit liquor traffic, *see under* Liquor Traffic.
    - Impossibility of working without *Way* ... 1860
    - Investigation of conditions by Mr. H. O. Buckle, *Pritchard* ... ... p. 94

Gold Mines—*cont.*
LABOUR—*cont.*
Native—*cont.*
Money taken home by, question as to amount p. 112–3
Native locations, *see under* Natives.
Payment, opinion of Consulting Engineers *re* system ... ... p. 109
Piece-work system :
Advantages, *Neuhaus* 1740–2
Favoured and extension of, *Neuhaus* ... 1661
Portuguese :
Memorandum by Witwatersrand Native Labour Association *re* amount of money taken home by, after period of service ... ... p. 113
Question of effect on, of wine drinking, *Pritchard* 2566–70
Productivity, increase possible by better organisation and adoption of piece-rate system, *Pritchard* p. 92, 2514–7
Proportion of whites to, *Way* 1858–9
Recruitment :
Advances :
Deputation to Prime Minister *re*, January 1913, and decision to leave question of stoppage of, in abeyance till end of year, *Schumacher* 2316
Stopping of, too hurriedly, undesirable, *Schumacher* 2316
Chiefs sometimes averse but many in favour of, *Schumacher* 2394–6
Cost :
too High, *Schumacher* 2315
and Question of possibility of reducing, *Neuhaus* 1683–5
Reduction should follow decrease of competition between mines, *Neuhaus*... 1756
Easier in diamond mines, *Frames* ... 990–1
No other system possible under circumstances, *Neuhaus* 1682
Payment of money to natives now paid to recruiter would act as stimulus to, *Frames* 1036–9
System, *Neuhaus* 1684
Voluntary :
1912, 1913, *Schumacher* 2311
Advantages to natives, *Schumacher*... 2311–3
the Ideal, but change must be gradual, *Schumacher* 2317–8
would Increase if colour bar removed, *Neuhaus* 1683
Increase, tendency to, *Schumacher* ... 2311
Reward should be considered, *Schumacher* 2313–4
Re-engagement, efficiency probably improved by period of rest, *Schumacher* 2471–4
Restrictions on nature of work :
by Custom and sentiment, reason for, *Way* 1762–8
Directions in which natives could be usefully employed, *Way* 1762–3
Nature of, and competency of natives to do work, *Way* 1700
Objections to, *Pim* 2148
Particulars *re*, *Smyth* ... 135–7, 177–80, 182–9
principal Reason why labour cannot be utilised more economically, *Neuhaus* ... 1647–9
Removal :
Efficiency would increase, *Way* ... 1701
Efficiency of white miners would increase, *Way* 1855–7
Natives could be more profitably employed in certain cases than whites are at present, *Way* 1639
Necessity for, a long way off, *Pritchard* 2488–9
Question of advantage to industry, country, etc., *Kotze* 1465–73
Total number of white men employed would be increased, *Neuhaus* 1856
Working costs would decrease, *Neuhaus* 1716–7, 1846–9
further Scope should be given, and suggested directions, *Pritchard* 2490
in Transvaal and Orange Free State, but not in Cape, *Kotze* 1258–62
Savings, question of, *Schumacher* ... p. 112–3
Shortness of stay, efficiency hindered by, *Schumacher* 2320–1
Short periods of service, a reason of inefficiency and large number of accidents, *Kotze* ... 1278–9

Gold Mines—*cont.*
LABOUR—*cont.*
Native—*cont.*
Some, extremely intelligent, *Kotze* ... 1395–6
Strike, 1913, *Pritchard* 2490
Unhealthy nature of work has not seriously affected, but may in future, *Evans* ... 715
Wages :
Average, per shift, *Pritchard* ... ... p. 92
Comparison with Premier Diamond Mine, *Frames* 1134–8
Complaints common and system of maximum average wage especially objected to, *Pritchard* p. 92 ; 2480A–6, 2577–8.
Contract system desired, *Kotze* ... 1392–4
Increase, tendency to, *Smyth* 162
Increase, tendency to, but better work will be obtained, *Schumacher* 2386–8
Limit, explanation, *Villiers* 1620–2
Reduction not advisable, *Schumacher* 2384, 2393
System, *Smyth* 169, 171, 184–90
System and fixed daily limits, and abolition might improve labour, *Evans* 711–4, 716–9
Profit sharing, difficulties, *Kotze* 1403–5
Proportion of whites to blacks, *Smyth*, 167 ; *Kotze*, 1334
Recruitment :
Restriction of area hoped for, *Williams*... 753–60
Shortage of labour in Natal gold mines owing to competition, of, *Williams* 749–53
Single shift systems :
Advantages, *Nathan* ... ... p. 100, 2613–5
Introduction all over Rand would be possible with general amalgamation, *Nathan*... p. 100, 2613–8
Wages, amount spent in, to white men and natives and number of each, 1912, *Smyth*, 9–11, 124–35, 163–4
Waste of, at present, *Nathan* 2592–3
White :
Advantages to be derived by, from general amalgamation, *Nathan* 2594–7
Blasting certificates, granting of, after eight months, and question of extension of period, *Kotze* 1474–82
Building of cottages for married people and letting at low rentals, *Kotze* 1409–14
City Deep, Ltd., model village, *Schumacher* p. 84
Contract system :
Cancelling of, and free grant, if workman does badly on contract through ill luck ... p. 109
a Cause of dissatisfaction, *Kotze* 1267, 1271, 1341
Discouraged officially by trade unions, *Kotze* 1415
Fixed daily wage, divergence of opinion *re* question of, *Schumacher* 2287–92
Fixed daily wage, plus bonus, might be preferable, and prevent instability, *Schumacher* 2287–8
Flat contract, and flat contract with guaranteed wage, systems ... ... p. 109
Flat contract system, abolition under consideration, *Neuhaus* 1659–60
Day's pay plus contract and day's pay plus bonus, systems, and advantage ... ... p. 109
Day's pay system, with or without bonus, should be tried more largely, *Kotze* ... 1274, 1392–4
Discharges, number and proportion, *Neuhaus* 1784
Efficiency :
Decrease since 1907, *Way* 1698–9
Possibility of improvement, *Kotze* ... 1352
Few men leave with considerable sum of money, *Nathan* 2684
Import of competent white miners a benefit to mines, *Kotze* 1481
Increased employment of, possibilities, *Wybergh* 2117–8
Inefficiency, reasons for, and comparison with Australian miners, *Kotze* ... 1343–8, 1351
Instability :
Causes, *Frames*, 1139–40 ; *Neuhaus*, 1655–6 ; *Way*, 1785 ; *Schumacher*, 2283–6 ; *Nathan*, p. 100, 2603–4.
Slackness of men as result of, *Nathan*, p. 100, 2594–5
Life, prospects as good as in other metalliferous mines, *Way* 1686
Natives under, frequently more skilled, *Way* 1856
Proportion to natives and number excessive, *Way* 1858–9

Gold Mines—*cont.*
LABOUR—*cont.*
White—*cont.*
Proportion to natives, increase advocated and importance of, *Wybergh* 2116
Recruitment, by Managers, advantages of, over Central Bureau, *Neuhaus*, 1664–6 ; *Way*, 1667.
Sons, few take up mining, but more apprentices could be taken, *Way* 1769–71
Strike, *Matthews* 2043
Supply not equal to demand, *Way* ... 1689
Systems of payment, opinions of Consulting Engineers and Managers ... ... p. 109
Taking on of men as learners, *Way* ... 1785
Trained at mining schools work as overseers in same way as others, *Kotze* 1406–7
Training, more care required, *Kotze* ... 1352
Underground, decrease in efficiency, *Way* 1786
Unskilled labour, importance of, *Wybergh* 2116
Use of, *Neuhaus* 1664
Wages :
Increase, tendency to, but better work will be obtained, *Schumacher*... 2386–8
Reduction not advisable, and not anticipated, *Schumacher*, 2383, 2393 ; *Nathan*, 2634–8.
White only, impossibility, *Kotze* 1348–50
Large tonnage of lower grade ores and importance of keeping working costs low, *Smyth* 10
LIFE OF :
Actual, usually exceeds estimated, *Smyth* ... 26
Estimate by Mr. Kotze of amount still to be worked, referred to, *Schumacher* ... ... p. 84
Estimate by Transvaal Chamber of Mines, *Smyth* 150 ; pp. 108–9
Estimate by Transvaal Chamber of Mines :
Basis of, *Way* 1813–26
Likely to be exceeded, owing to supply of more tonnage than estimated from existing mines, and accession of new mines, *Neuhaus* 1641–3, 1812
Mines not yet producing or existing not included, *Kotze* 1233–5
Opinion *re*, *Kotze* 1233–5
Question whether unduly pessimistic, *Smyth* 18, 25–6, 83–6, 92–5, 181
Question of, *Smyth* 157–9
Statement of Minister of Mines and Industries *re*, February, 1914, *Smyth* ... ... 181 *note*
MACHINE DRILLS :
Economy of labour caused by use of, and possibilities of, *Way*, 1692–7 ; *Schumacher*, p. 83, 2295–300, 2389–92, 2465–6.
Increasing use of, *Schumacher* ... ... p. 83
Introduction, dependence on characteristics of mine, *Way* 1692–3
Productivity of boy on, and on hammers, comparison, *Schumacher* 2467
Proportion to hand drilling, December, 1913, *Way* 1691
Room for introduction of small machines, *Kotze* 1249–51
Universal adoption of, question of, *Schumacher*, 2395
White labour would increase slightly, *Schumacher*, 2306–8, 2465–8 ; *Nathan*, 2610–2.
Main deposits, position, *Smyth*... 6–7
the Main mineral output, *Smyth* 2
Miners' Training School, *Kotze* 1353–6
new Modderfontein Mine, decrease in labour required owing to increased use of machines, etc., *Schumacher*, p. 83, 2295 ; *Nathan*, 2592.
NATAL, Output :
1910, 1913, *Audas* 933–5
Small, though large area held for, and prospects said to be good, *Audas* 827, 870, 935
Nationalisation advocated if essential but other means of exchange than gold anticipated, *Matthews* 2075–9
Native locations, *see that title.*
NON-DIVIDEND PAYING MINES :
Proportion of total costs, 1911, 1912, *Neuhaus* 1774
Results, 1913, *Neuhaus* 1774
Non-producing mines, approximate value of shares, *Neuhaus* 1635
Non-working, reasons, *Neuhaus* 1839–42
Number that will cease production at different dates based on lives as fixed for taxation purposes, number of stamps dropped, value of gold produced and dividends paid during 1913, *Kotze* ... ...1229 *note*
Orange Free State, some reefs, but not found in payable quantities, *Frood* 619
Ownership of industry by foreign investors, not by State, *Wybergh* 2115, 2119–22, 2130–6

Gold Mines—*cont.*
Payable limits, *Smyth*, 62–5 ; *Kotze*, 1487–8.
Payments for interest and redemption of debentures and repayment of loans, 1912, *Smyth* ... 9
Possibilities of mines at present undiscovered, *Schumacher* 2333–4
PRODUCING MINES :
Estimated total remaining to be crushed, *Neuhaus* 1636–8
Market value of shares, *Neuhaus* 1634
PRODUCTION :
1911, 1912, 1913, *Smyth* 2–6
1912, the high water mark and increase not anticipated, *Smyth* 4, 16–7, 25
1913, decrease, reasons, and increase might have been possible if all conditions favourable, *Smyth* 54–8
Profits and amount paid in dividends, 1912, *Smyth* 9
Profits, dividends, interest and redemption of debentures and loans, 1912, *Smyth* 59–61
Profits, mines making working profits of 2s. and less, *Neuhaus* 1654
PROFITS TAX :
Amount, and proportion of profits, *Neuhaus* 1729–32
Estimating of life of mines for, *Smyth* ... 80–1
Rate, *Audas* ... ... 845 *note*
System, *Smyth*... 96–102
Rand Mines, Ltd., and Central Mining and Investment Corporation, Ltd., group, dividends, 1913, and tonnage crushed, *Schumacher* ... ... p. 82
Recently discovered payable mines, *Schumacher* 2333
Recovery value, decrease, 1902–1912, *Way* ... 1827–30
Reserves, *Neuhaus* 1790–2
no Sinking fund set aside against closing of mine, *Neuhaus* 1789
STORES :
Chemicals, proportion, *Neuhaus* 1721
Cost, proportion to total working costs and question of reduction, *Neuhaus* 1719–20
Expenditure, 1912, *Smyth* 10
General feeling is to buy in best market, and no preference as regards British goods, *Nathan* 2672–8
Purchase locally, *Nathan* 2619–23
Taxation of profits on mining, rate, *Audas* ... 845 *note*
Taxation system, *Smyth* 96–102
TEMPERATURE :
Increase with depth, *Way*, 1705–6, 1709–12 ; *Schumacher*, p. 113, 2342–6 ; *Martin*, p. 114.
Reduction by ventilation system, *Way* ... 1713–4
Tonnage broken by machines, 1913, and total tons hoisted, *Kotze* 1248
Tons milled, recovery per ton and cost per ton, 1902–1913, *Smyth* ... ... 8 *note*
Tons milled etc., figures for 1913 much the same as for 1912, *Smyth* 7
Tons milled, value, working costs and profit, 1912, *Smyth* 7
Total tonnage crushed and total gold produced, to end of 1913, and during 1913, *Neuhaus*... ... 1630–2
Total tonnage of ore raised to end of 1913 and amount and value of gold produced, *Kotze* ... ...1489 *note*
TRADING STANDS :
Abolition desirable, and compensation could be given where necessary, *Schumacher* ... ... p. 84
Allowed by Government in order to derive revenue, *Schumacher* 2397–400
Articles allowed to be sold, and temptation to sell liquor, *Schumacher*... 2402–8
Companies would be willing to give up any share of revenue from, if abolition possible, *Schumacher* 2426–7A.
many Licenses granted in opposition to wishes of mining companies, *Schumacher* ... p. 84, 2401, 2404, 2406
Mines have no interest in carrying on trading, *Neuhaus* 1781–2
Monopoly question, *Neuhaus* 1775–80
Opening of stores by Government, statutory provision against, *Neuhaus* 1747–51
Position prior to Act 13 of 1910, *Schumacher*, p. 114–5
Position under Act 13 of 1910, Transvaal, *Schumacher* p. 115
Storekeeper, no power to get wages of recruited boys for debts, *Schumacher* 2469
System, *Gemmill*, 1671–3 ; *Neuhaus*, 1673–6, 1745–6
UNTOUCHED AREAS :
Capital required for, rough estimate, *Kotze*, 1242–3 ; *Way*, 1644–6
Production of payable ore likely to equal that produced by existing producing mines, and estimated amount, *Kotze*, 1238–41, 1315–22, 1357–9, 1397–400.

Gold Mines—*cont.*
Value per ton, practically no variation during last five years, *Neuhaus* 1830
Van Ryn Deep, capital and value of shares, *Matthews* 2058–9
Ventilation, artificial, *Kotze* 1432
Witwatersrand area the main centre and length of reef, *Smyth* 6–7
Working at a loss, stopping of mines by Government not desirable, *Kotze* 1451–8
Working costs :
Administration expenses, reduction, *Way* ... 1832–4
Argument that reduction of, would increase life of mine, not used to Trade Union, *Smyth* ... 82
Decrease, *Way*... 1831–4
Decrease :
Anticipated, *Smyth*, 18–21 ; *Neuhaus*, 1639 ; *Way*, 1639 ; *Schumacher*, 2439–40.
possible Factors, *Smyth* 66
Importance of, *Neuhaus* 1716
Importance of, in opinion of Transvaal Chamber of Mines ... ... p. 109
by Improvement in methods anticipated, not reduction of wages, *Smyth* 160–1
in Last ten years, and further decrease probable, *Kotze* 1235–7, 1244–54
Methods, *Neuhaus* 1717–20
Possibilities, *Smyth*, 90–1 ; *Neuhaus*, 1843–9.
would be Possible without reduction of wages by general amalgamation, *Nathan*... ... p. 100
of Dividend and non-dividend paying mines, *Neuhaus* 1654
18·75 shillings estimate of tonnage above, *Smyth* 24
Items, *Neuhaus* 1722–5
Paying level, *Smyth*, 23 ; *Way*, 1813–26.
Reduction, and increase in profits 1910–13, reasons, *Schumacher* 2437
Working costs, dividends and profit tax, 1913, *Neuhaus* 1633–4
Working of grades at present not payable will be possible in future, *Kotze* 1401–2
Working profits and dividends, *Schumacher* ... 2335–6
Gorgas, General, report referred to, *Kotze*, 1278–1281, 1332–3, 1416, 1437, 1483–4
Grain and grain products, import from Canada, 1909–13. *Egan* ... ... 3057 *note*
Griqualand West, iron ore deposits, *see under* Iron Ore.
Gunnies (grain bags and wool packs) from Calcutta, light weight and inferior quality, unsatisfactory method of settling disputes and question of remedy, *Buchanan*, *Butcher* ... ... p. 162, 3447, 3471–83

H.

Hardware, etc. :
Exhibition of samples of foreign goods, *Holland* 2843
Imports from Canada, 1909–13, *Egan*... 3057 *note*
Hatting Spruit district, waste of coal by method of working, *Audas* 968–70

I.

Illicit Liquor Traffic, *see under* Liquor Traffic.
Immigration, excess of emigration over :
According to statistics but question of reliability. *Holland* 2811
Labour unrest one reason, but will correct itself, *Holland* 2926–7, 2941–3
Imperial Advisory Board, desirable, *Holland* ... 2971
Imperial Institute :
Reports, use made of, *du Toit* 228
Samples of iron ore sent to, and analysis received, *Dunlop*... ... ... 770–1, 809
South Africa not adequately represented, *Soutter* 2687–8
Imports, *see under* Trade.
Income Tax, none in South Africa, *Smyth* ... 100–2
India :
Gunnies from, light weight and inferior quality, unsatisfactory method of settling disputes and question of remedy, *Buchanan*, *Butcher*... p. 162, 3447, 3471–83
Possibility of developing trade to, question of cheap freights, etc., *Anderson*, *Reynolds-Tait*, p. 165, 3509–15
India—*cont.*
Rice imported from, standardisation of official grading and certified weights, need for, and proposals, and question as to steps taken, *Buchanan*, *Butcher*, p. 162, 3448–60, 3493–500
Industrial conditions in S. Africa, *Laite* ... p. 152
Industries, *see under* Trade.
Insolvency Law, different in each province, and progress towards consolidation slow, *Jagger* ... 3795–6
Insurance, uniform law, possibility, *Mackeurtan* p. 182
Iron Ore :
Blast furnaces for making pig iron for export to Europe considered but not started, *Kotze* ... 1370–1
Deposits not opened up, *Kotze* 1368
Districts, *Kotze* 1367
Foundries, *Dunlop* 776–9
Griqualand West and Bechuanaland deposits :
Character of analysis, etc., *du Toit*, p. 8, 195–9, 242–5 ; p. 106.
Construction of railway into area under consideration by Government, *du Toit* 195, 210–2
Date of discovery, *Smyth* ... ... p. 105
Exploitation, profitable, not anticipated for some time owing to distance from main lines of railway, *Smyth* ... ... p. 105
Mining at low cost possible, but smelting elsewhere necessary owing to absence of coal and export contracts, *du Toit* ... p. 8, 200–4, 210–4, 218–21
Possibilities, *Smyth* 42–5
Report on, by Assistant Director of Geological Survey ... ... p. 105–6
State believe l to have retained rights, *du Toit* 215–7
Manufactories, question of establishing, *Smyth*, 144–9 ; *Ehrlich*, 3309.
Markets, question of, *Smyth* 49–53, 87–8
Natal (*See also* Pietermaritzburg district) :
no Actual working, *Audas* 940–2
Deposits known, but little developed, *Audas* 868
None known which is workable, *Malcolm* ... p. 105
Nationalisation of mines advocated, *Matthews* 2075
Outcrop discovered by Mr. Wolff in Kenhardt district, quality of, prospects, etc. ... ... p. 118
Pietermaritzburg district :
Competition with Spanish ore at Middlesborough would not be possible with present freight, *Dunlop*, 820
Export question, *Dunlop* 820–4
Foundries :
Coke for, manufacture in Natal, cost, etc., and question of possibility of getting cheaper, *Dunlop*, 780–807
Flux, difficulty *re*, owing to lack of railway communication, *Forsyth*, *Dunlop* ... p. 26, 795–9
for Production of castings, possibility of establishing, *Forsyth*, *Dunlop* ... ... p. 26
Outcrops held mostly by private individuals, who would be willing to allow working, *Dunlop*, 773–5
Pig iron produced, but not yet a commercial proposition, *Audas* 868–9
Smelting with blast furnace, experiments and results, *Forsyth*, *Dunlop* ... ... p. 26
Three kinds of, and analysis, *Forsyth*, *Dunlop*, p. 26 770–2, 808–12
near Prieska, only recently discovered, and not yet carefully investigated, *Kotze* 1369
Railway freight, *du Toit* 203
Resources, publications referred to, *Kotze* ... 1295–7
Rhodesia, quality, export, and price ... ... p. 118
Works at Vereeniging, *Smyth*, 47–9 ; *Ehrlich*, 3309.
Ironstone :
Natal, resources, *Malcolm* ... ... p. 104
Newcastle district, smelting, question of possibilities, *Malcolm* ... ... p 104
None seen in Newcastle district, but small portion on Buffalo flats, *Logan* ... ... p. 105
Irrigation, difficulty of securing native labour, *Pritchard*, 2539

J.

Jagersfontein diamond mine, *see under* Diamonds.
Jebb, Richard, evidence referred to, *Holland* ... 2837
Johannesburg :
Chamber of Commerce, representatives, *see* Chappell, E Robinson, A. F., *and* Soutter, H. W.

Johannesburg—*cont.*
Prices of Natal imported coke in, *Dunlop* ... 785–91
South African School of Mines and Technology, note by Mr. Lorimer on visit to ... ... p. 118
Jute and Hemp Bags, export from India, 1912...2904 *note*

K.

Kimberley diamond mines, *see* De Beers Consolidated Company, *under* Diamonds.
Klip River District, coal, *see under* Coal.
Knight's Deep Mine, *see under* Gold.

L.

Labour:
see also Natives, Whites, etc., *and under particular industries.*
Central Labour Bureau, use of, policy, etc., *Shanks* 1976–88
Coloured, dear, *Anderson* 3590–1
Exchanges, provision of workers during strikes complained of, *Matthews* 2089–91
NATIVE:
Cape Town Docks, work side by side with whites, *Villiers* 1614
Natal, difficulties, *Pritchard*... 2539
Skilled artisans, production in South Africa doubted, *Pim* ... ... p. 77
WHITE:
Apprentices:
Occupations to which apprenticed and system, *Shanks* 2033–9
Reluctance of boys to be apprenticed and to complete training, *Pim* ... 2159–61, 2227–9, 2235–9
Small number of, drawback, and reasons, *Shanks*, 1919–24; *Pim*, 77.
Apprentice system extended lately on mines, *Shanks* 1918
Desire of employers to have native labour trained, so that white men's labour may be dispensed with, *Shanks* ... ... p. 64; 1960–4
Encouragement of, importance of, and Government should not protect Kaffirs by law against, *Matthews* 2043, 2057–74
Healthy public opinion in favour of indenture system and conditions being favourable to employment of young men desirable, *Shanks* ... 1925
Inspector of, duties, *Shanks*... ... ... p. 64
Reluctance to perform work performed by whites in other countries, *Shanks* ... p. 64–5; 1897–900
Replacement of Kaffir labour by, impossibility, *Anderson* 3608
Standard wage, exemption certificates to less competent workers would meet difficulties, *Shanks* 2006–8
Value of, compared with Kaffir, *Anderson*... 3609–11

Land:
see also Agriculture.
Registration, system, *Benjamin* 3778
Value, increase, *Ehrlich* 3432–5

Lead:
in Western Transvaal and near Pretoria, *Kotze* 1382
Worked to small extent, *Kotze* 1383

Leather industry:
Development, *Laite* 3222–3
Establishment of tanning factories, possibility, *Ehrlich* 3316–22, 3364–6
Pietermaritzburg, particulars and prospects, *Forsyth*, *Dunlop*... ... ... 3679, p. 171
Lime, production, *Smyth* 15

Liquor Traffic:
BOTTLE LICENCES:
Abolition desirable, *Schumacher*, 2412–21; *Mabass* p. 123
Abolition of, as regards stores and non-recovery of credit, would be advantageous, *Shanks*, 1971–3, 2010–4
Conditions, etc., *Pim*... 2240–9
Sale of whisky on credit, question of remedy, *Shanks* 1971–5
Cape brandy import into Transvaal, decrease, 1912, as compared with 1911, *Pritchard* 2497
Distillation by natives, practically none, *Pritchard* 2563–5
Extracts from Liquor Licensing Ordinances, 1902, 1906, *Schumacher* ... ... pp. 83–4

Liquor Traffic—*cont.*
ILLICIT:
Closing of compounds would help to prevent, but difficulties, *Pim* 2261–5
Brewing of beer for natives, as in Durban, would remedy evil, *Mabass* ... ... p. 123
Convictions, Transvaal, 1912, 1913, statistics and details, *Pritchard* ... ... 2497 *note*
Decrease in cases of Europeans charged with selling to natives, and in cases of drunkenness among natives, 1913, Transvaal, *Pritchard* ... 2496–7
serious Extent, *Pritchard* 2581–2
Increase said to have resulted from practical abolition of brewing in compounds, *Pritchard* ... 2579
Increasing, *Villiers*, 1524–8; *Neuhaus*, 1679.
Increasing and efficiency of natives injured by, *Kotze* 1284–8
Large amount of, and loopholes left in present regulations, *Schumacher* ... pp. 83–4, 2409–21
Large number of people, chiefly poor whites, living on traffic, *Villiers* 1529–31
present Law not able to decrease, *Pim* ... 2250
Manufacture of "Khali" by natives, *Neuhaus*, 1681; *Pim*, 2258; *Pritchard*, 2497, 2555–62.
Number of shifts lost through drink, December, 1911, 1912, 1913, *Gemmill* ... 1680, 1752–5, 1788
Prohibition of importation of golden syrup into compounds, beneficial results, *Pritchard*... 2497–8
Regulations do not enable control of, *Pim*... 2259
Sale of light wines, objection to proposal, *Schumacher* p. 84, 2367–77
Working of, *Pim* 2251–8
Issue of kaffir beer to natives in compounds recommended, and reduction in drunkenness in Durban since establishment of native restaurants where kaffir beer sold, *Pritchard* 2534
Labelling of man as not to be supplied with drink, might be possible, *Shanks* 1992–4
LOCAL OPTION:
Advocated, *Schumacher* 2378–82, 2423–5, 2441–3
not Favoured, *Pritchard* 2535–6, 2571–2
Preferred to prohibition, *Shanks* 1965–75
or Right of local veto advocated, *Schumacher* p. 84
Low-class whites to blame for influencing natives, *Mabass*... ... ... p. 122–3
Portuguese labour, supply of Portuguese wine to, *Kotze* 1327–31
Prohibition against supply of liquor to natives, law in force over practically all South Africa, *Neuhaus*, 1755
Recovery of price of liquor, if supplied on credit, not allowed, *Schumacher*, 2422; *Mabass*, p. 123.
Sale to natives absolutely prohibited in Transvaal, *Mabass*... ... ... p. 123
Total abolition should be aimed at, *Schumacher* 2475–8

M.

Machin, Stanley, evidence referred to, *Holland* 2843, 2844

Machinery, import:
German and American competition, and reason for, etc., *Holland* 2914–9
from United Kingdom, proportion, 1912, *Holland* 2910–3

Maize:
Decrease in exports, 1910–11, *Holland* ... 2870
Price, *Williams* ... ... p. 106

Malting:
Houses at Port Elizabeth and Pretoria, *Dunlop* 3710
Pietermaritzburg district, *Forsyth*, *Dunlop* ... p. 171

Manganese, Cape Province, Imperial Institute communicated with *re*, *du Toit* 225–6

Match-making industry, *Laite* 3236–8

Mealies, *see* Maize.

Memba, Councillor, quoted *re* native labour, *Pim* 2164

Messina Copper Mine, *see under* Copper.

Metals and Manufactures, import from Canada, 1909–13, *Egan* ... ... 3057 *note*

Miners' Phthisis:
Chances of, reduced so as to be almost negligible, *Neuhaus*, *Way* 1687
Contributory negligence on part of workman, *Way*, 1852–4; *Shanks*, 1941–2.
Death-rate, reduction hoped for in future, *Kotze* 1430
Disease may be equally bad in other countries, but figures not obtainable, *Way* 1689–90

Miners' Phthisis—*cont.*
Effect of, on efficiency, *Kotze* 1351–2
Hammermen and machine men equally liable to contract, *Matthews* 2049
Improvement not anticipated for some years, *Matthews*, 2087
Improvements carried out in mines, *Shanks* ... 1936–40
Miners' contributions, *Gemmill* 1793–4
Prevention :
Methods enforced by Government for, *Kotze* 1422–9
Obligations *re*, carried out by companies, *Neuhaus* 1850–1
Spreading of, by use of same drinking vessel, steps might be taken against, *Kotze* 1433–7
Statement on, in Statement to Economic Commission referred to, *Neuhaus* 1688

Mines and Mining :
See also names of minerals and Diamonds.
Cape Province, no large prospect of development outside known areas, *du Toit* 208
Capital for mining development, not less easy to get since statement presented to Economic Commission by Chamber of Mines, *Neuhaus* 1836–7
Conversion from steam to electric drill, *Holland* 2817–8
Co-partnership or profit sharing, not really discussed, *Kotze* 1323–6
Drilling by compressed air, *Holland* 2871
Exports, value of, compared with value of general exports, 1911, 1912, 1913, *Smyth* ... ... 16 *note*
Gases produced by explosions, steps taken to minimise evil results, *Kotze* 1431
Health in :
Conditions fairly satisfactory, and companies willing to carry out suggestions, *Shanks* 1936–40
Supervision, *Frood* 640–2

Labour :
Chinese, particulars *re* replacing of, *Pritchard* 2575
Coloured :
should be Allowed to do white man's work if equally competent, and if work done at same prices, *Matthews* 2094–8
